In 1958, when our unemployment rate was almost 7 percent, a distinguished economist from Cambridge, England, visited the University of Colorado and was appalled that any modern nation in this age of post-Keynesian economics would tolerate such a high level of unemployment. In any case, whether we consider a 4 percent unemployment rate, which is approximately what we have now, or the slightly higher rate of the preceding era, it involves directly some 3 million people, plus another seven million dependents. What is unique about the present unemployment is not only its magnitude, but the fact that it represents an important facet of the "class poverty" concentrated in particular groups which by and large are outside the mainstream of our affluent society.

A Historical Perspective. In order to comprehend the significance of the "War on Poverty" it should be placed in some historical perspective. We may use 1776 as our starting point since Adam Smith's The Wealth of Nations as well as Thomas Jefferson's Declaration of Independence were published that year. It is not a sheer coincidence that both of these revolutionary documents appeared at the same point in time since both reflected the prevailing natural law philosophy of the late 18th century. Adam Smith was the forerunner of the classical school of economics, followed by Thomas Malthus and David Ricardo. Their economics were based on the triad of scarcity, diminishing returns and a cost theory of value. However, Adam Smith was somewhat optimistic about the future if "laissez-faire" capitalism were permitted to operate with a minimum of social restriction. He believed that through specialization, the accumulation of capital, and competition in the marketplace -- the "invisible hand" concept -- the level of national production would increase indefinitely.

In contrast, the economic theories of Malthus and Ricardo were considered the "dismal science," not because their analysis was invalid or uninteresting, but rather because it led to the inescapable conclusion that the masses could expect nothing other than economic misery and a subsistence standard of living. The Reverend Malthus wrote his famous essay on population in 1798 and the thesis is well known -- that population tends to increase at a geometric ratio while production increases at an arithmetic ratio. Hence, nations are always confronted with serious economic shortages and nothing can be done about it since this is an immutable law of nature. People have an innate propensity to procreate, and in the absence of economic constraints they multiply like fruitflies. In short, regardless of welfare legislation and social action, population always tends to outstrip production and realistically can be checked only by increased mortality which results from disease, starvation, pestilence and war. Although "dismal," this Malthusian doctrine still has validity and importance in the 20th century for such underdeveloped countries as India where the race continues to be between food and babies.

Ricardo, in turn, used the Malthusian theory as the basis of his "Iron Law of Wages." Given the economics of scarcity, the nation's total output is analogous to a big pie which cannot be made any larger because of the scarcity of resources -- this is the "full employment" pie. For Ricardo, the basic problem was one of distribution, i.e., how to divide the pie among the resource factors responsible for production. According to this analysis labor's share of the pie in the form of wages was unalterably fixed at subsistence. Since the wage share could not be changed, the conflict was reduced to the division of the remainder of the pie between business profits and land rents or the incomes of the rising bourgeoisie and the landed aristocracy. Thus, the class struggle of the 18th century was not between labor and capital, but rather between the new industrialists of the midlands of England, pitted against the dying order of the landed gentry.

But why should the wage share be fixed at a subsistence level? According to Ricardo, this was a long-run phenomenon resulting from the short-run swings of wages and population. Given Malthus' law of population, when short-run wages increase above subsistence, the nation's population and corresponding labor force must increase. In turn, the growth in the supply of labor invariably must cause wages to fall; but when wages drop below the subsistence level, by definition, mortality rates must rise and population declines. This drop in population results in a contraction in the supply of labor and wages must once again rise above subsistence. Now the Malthusian doctrine takes over again -- people have more babies, the population and labor supply expand, wages are depressed below subsistence, and the vicious cycle continues ad infinitum. Thus, although wages in the short-run may oscillate above and below subsistence, in the long-run they have to average out at the subsistence level. This allegedly was natural law and neither trade unions nor social welfare legislation could affect this long-run subsistence wage. In brief, the Malthusian-Ricardian "dismal science" did not offer any hope for alleviating the poverty of the masses.

This classical theory was the dominant economic doctrine of the Western World for almost a century -- from 1776 to 1867, the year of the publication of Karl Marx' Das Kapital. Although Marx was unwilling to accept the "natural law" theory, he too structured his analysis of industrial capitalism on a subsistence wage theory, but one not tied to population. Instead, the Marxian subsistence wage was based on the institution of private property and the idea that under capitalism labor produced a surplus value which was appropriated by the capitalist class. In its simplest formulation Marx contended that labor produces more value than it receives in wages, and that the difference accrues to

the capitalist. The capitalist, in turn, always striving for more profits, invests the surplus value in new plants and equipment in order to achieve greater output and efficiency. With improved technology a smaller labor force is required and, consequently, unemployment must rise. The masses do not receive sufficient purchasing power to buy all the goods produced by the system and, therefore, glutted markets result which cause depression and further unemployment. Thus, the capitalist process itself generates an "industrial army of the unemployed" which keeps wages continually depressed at a subsistence level. Moreover, according to Marx, this process of over-investment and under-consumption leads to ever-widening business cycles of boom and bust until finally the whole system collapses. You may recall that in The Communist Manifesto Marx asserted that the capitalists would be their own gravediggers. In brief, Marx, like the classical economists before him, had no solution to the problem of raising real wages and the income share of labor under capitalism. As a matter of fact, he contended that the poor would get poorer and the rich richer. In other words, whether the doctrine was propounded by conservatives or liberals, socialists or tories, the end result was always the same -- poverty was inevitable under capitalism.

The next significant date for our inquiry is 1936, the year John Maynard Keynes published his General Theory of Employment, Interest, and Money. Keynes was not willing to accept either the "dismal economics" of the classical school or the exploitation theories of Marx. His major contention was that capitalism of the 20th century was markedly different from that of the 19th century. First, it should be noted that in a modern capitalist economy government should and does play a significant role. The classical economists, in a manner similar to Thomas Jefferson, believed that "that government governs best which governs least" and that the development of the economy should be left essentially to the automaticity of market forces, private self-interest, profit maximization and the "invisible hand" of competition. Similarly, Marx did not foresee the emergence of the public-private "mixed economy" which has become the hallmark of modern capitalism. In contrast, and particularly as a result of the Great Depression of the 1930's, Keynes recognized that government could play an important role in maintaining economic stability and prosperity. He suggested that when productivity or Gross National Product was falling, government could check and offset a depression by increasing the level of public spending, but it had to be done without corresponding tax increases. Thus, Keynes introduced the principle of deficit spending to achieve a balanced economy. He contended that there was nothing sacrosanct about balanced budgets for government. If the economy was faltering, it should be stimulated by adequate government deficit spending; and when prosperous and highly productive, the government should plan budgetary surpluses. Over the long-run the budget will balance out, but in the short run a balanced growth economy based on increasing productivity is far more important than a balanced budget. Of course, this is an oversimplification of Keynesian economic policy. There are a number of complex issues involved. Should government intervention in the economy be direct by way of nationalization, regulation or coercion, or indirect by use of fiscal and monetary policies. Moreover, if the latter course is pursued, there is still the problem of the particular "mix" to be used or how to integrate fiscal policies with monetary policies. And in the area of fiscal policy should desired deficits (or surpluses) be achieved through changes in public spending or taxes? It is apparent that deficit spending is one of the most direct means by which the government can influence the economy. On the other hand, there are situations for which it is not appropriate. For example, in 1962-63 Detroit was one of the major depressed areas of the nation. Thousands of people were out of work and it was decided to pump millions of dollars into the Detroit economy through Area Redevelopment Programs. However, by the time the money got through the agencies and into the economy, the region was enjoying a boom -- the automobile industry was producing 8 million new cars a year and Detroit was no longer a depressed area. The difficulties with particular public spending programs are that they involve significant time lags and are regionally selective. Government spending directly influences only the economy of the area in which the money is poured and the spillover effects on the economy as a whole are accordingly reduced.

In contrast to government spending fiscal policy may take the form of generalized tax cuts, not to reduce public revenues, but rather to stimulate private spending. A reduction in business taxes generally induces increased business investment. Similarly, a cut in personal taxes increases consumer expenditures across the nation. If consumption is raised, this gives rise to further increases in business investment and overall economic activity expands. The net result is that tax cuts can stimulate the private economy just as effectively as increased government spending.

According to classical economics, appropriate government monetary policy was to set up the rules of the game, but otherwise be neutral -- i.e., government should not try to influence the quantity of money and credit in the system or the level of interest rates. These should result solely from the interplay of market forces. Interest was determined by supply and demand. Savings and investment automatically were always in balance because if the savings were too high, the interest rates would be forced down by competition until the supply of savings was brought into balance with the demand for investment funds. Contrariwise, if the demand for investment funds was too high relative to the supply of savings, competition among the business firms would force the interest

rates up until once again the demand and supply of funds were balanced. Thus, interest was the great equilibrator which kept savings and investment, as well as the overall economy, in balance -- in equilibrium at "full employment." In other words, flexible interest rates eliminated any need of governmental interference.

Keynes said that this was not so. He pointed out that interest was not determined by the interaction of savings and investment, but rather by the demand and supply of money. The interest rate depends on how much money people wish to hold ("liquidity preference") relative to the amount of money actually in the system. Thus, if the government follows an "easy money" policy by increasing the money supply, interest rates fall and both business investment and consumer spending increase since the cost of credit has been reduced. On the other hand, if a "tight money" policy is pursued and the money supply is reduced or not allowed to grow at an adequate rate relative to over-all economic growth, interest rates go up and choke-off both business and consumer spending. So money, instead of being neutral, has a pervasive influence on the stability and growth of the economy. Therefore, the determination of the supply of money cannot be left solely in the hands of bankers and the free operation of market forces. In any case, Keynes pointed out that by controlling the money supply government can affect the level of economic activity. Thus, the public authorities can influence the economy by operating through monetary policy, fiscal policy, or some integrated combination of the two.

Another Keynesian contribution was his general theory of employment. As noted in classical economics, involuntary unemployment could not exist if the system operated properly. Under these conditions only "voluntary" unemployment could occur. On the other hand, if there were large numbers "involuntarily" unemployed, as during the Great Depression, then it was evident that the system was not functioning properly, primarily because collective bargaining by unions, minimum wage legislation, and other social welfare measures interferred with the free play of market forces and pushed money wage rates above their alleged "real" market values. Thus, if there were no jobs, it was due to the fact that governmental interferences had pushed wages too high and business and industry could not afford to hire the unemployed.

Keynes argued that the classical explanation of employment was a special case and not a general theory. In the Keynesian analysis social welfare legislation and unions have the opposite effect of that assumed in classical theory. Instead of pushing wages too high, they help establish a basic social minimum -- a floor under wages. In other words, cutting wages to cure a depression would actually have a perverse effect and only worsen the situation. Moreover, Keynes contended that the basic cause of a depression was the insufficiency of aggregate demand and that it was theoretically possible for the economy to be in balance at a level significantly below full employment. Hence, a chronic depression could persist indefinitely if nothing were done to change aggregate demand. In order to get the economy moving, something had to be done to stimulate the level of aggregate spending. It could take the form of increased consumption spending on the part of householders, or increased investment expenditures by the business community, or increased government spending, or by some combination of all three. But something had to be done to push up Gross National Product. In short, if government did not intervene, the economy would stagnate indefinitely in a depression condition.

The first break-through in the New Economics came in 1946. Now, let me review the situation which led to the change. As already indicated the Great Depression lasted 12 years, from 1929 to 1941, and despite all the efforts of the New Deal extensive poverty existed until we entered World War II. The war validated the Keynesian analysis. We increased government spending and ipso facto eliminated unemployment. This provided clear-cut evidence that increased governmental outlays, if sufficiently large, could eliminate wide-scale unemployment. On the basis of this war experience Congress passed the Employment Act of 1946 -- a landmark in social legislation. For the first time in our history the federal government stated explicitly that it was the responsibility of government "to maintain high levels of income, production, and employment" in our free enterprise, capitalistic system. In other words, as a nation we would no longer rely solely on the automatic operation of the market place (Adam Smith's "invisible hand") to bring us out of the economic doldrums or stave off depressions.

The next breakthrough came in 1963-64 in the form of the first Keynesian tax cut by the federal government. Taxes were reduced, spending and income increased, Gross National Product rose, and the economy moved ahead. This was the first large-scale application of the "New Economics" by Kennedy and Johnson to federal fiscal policy. It was an explicit recognition that government does not have to rely on a balanced budget, but rather should attempt to achieve a balanced economy with a high level of employment. In order to fully appreciate the significance of the 1963-64 tax cut, let us compare this with the policies pursued by Eisenhower. During the 1958 recession Eisenhower

explicitly advocated a balanced budget for the federal government, but ended up with the largest peace-time deficit in our history -- $13 billion. In contrast, the 1964 tax cut represents the first time in American history that the federal government actually planned a budget deficit to stimulate economic growth and would not allow itself to be hampered by the myth of a balanced budget. The 1964 tax cut consisted of a $9 billion individual income tax reduction plus a $2 billion corporate income tax reduction. But the $11 billion tax cut had a multiplier effect in excess of two -- i.e., every dollar of reduced taxes induced an overall increase in consumer and business spending of more than $2. In other words, as a result of the initial $11 billion tax reduction, the Gross National Product rose by about $25 billion. In short, our fiscal policy in this instance worked in a manner just as Keynes said it would -- resulting in increased income, production and employment.

The third breakthrough came in the latter part of 1964 with the passage of The Economic Opportunity Act. Notwithstanding the large amount of criticism leveled at this program, some valid and some invalid, the important thing to remember is that with the passage of this act we witness for the first time in history a government taking the position that poverty should not be tolerated in a modern nation. No longer is the classical theory of scarcity applicable to an economy of abundance such as we have in the United States today. Poverty can be eliminated if the nation sets this as a primary goal and government pursues the appropriate economic policies. Contrary to the classical theory which assumed that the poor must always be with us since subsistence wages resulted from immutable laws of nature, or the Marxian analysis which concluded that the only solution to poverty under capitalism was revolution, or the neo-classical doctrine which placed its major reliance upon impersonal and automatic market forces, we now have widespread acceptance by economists, businessmen and politicians of the basic Keynesian position -- that appropriate government action, particularly in the form of fiscal and monetary policies, can achieve high levels of production, income and employment in a "mixed" capitalistic economy such as ours. The acceptance of this Keynesian analysis and its successful implementation in the 1960's, in turn, has led to the widespread recognition, in and out of government, that poverty is no longer necessary even in a capitalistic economy. Whether or not President Johnson accomplishes his objective of eliminating poverty is a different question. What is important in this survey is the fact that our government has articulated this new policy that the American economy can and should abolish poverty.

Trends in the Incidence of Poverty. How much poverty is there in the United States today? Obviously it depends on how you define it. In the 1964 Economic Report of the President, the Council of Economic Advisers (CEA) defined poverty very loosely as money income before taxes of less than $3,000 for a family of four or an income of under $1,500 for an individual. Since then the Department of Health, Education and Welfare has developed new criteria based on consumer needs and expenditures, size of family, location of family, and other economic factors. These are used as our standards to measure poverty today. For example, the HEW poverty level is $3,130 for a four-person urban family; for a four-person farm family it is only $2,190 since such families have their own farm-produced food and in general better housing than non-farm families. For a single person the poverty line is $1,540 and for a single person living on a farm the amount is $1,180. The criteria and results are not strikingly different from those originally set up by the President's Council of Economic Advisors.

First, let us examine what has been the course of poverty during the past third of a century, as shown in Table I.

Table I

POVERTY IN THE UNITED STATES
SELECTED YEARS, 1929-1964

| Year | Total Population | Persons in Poverty | Poverty Ratio |
|---|---|---|---|
| 1929 | 122,000,000 | 60,000,000 | 50% |
| 1947 | 145,000,000 | 45,000,000 | 32% |
| 1955 | 166,000,000 | 41,000,000 | 25% |
| 1959 | 178,000,000 | 39,000,000 | 22% |
| 1961 | 181,000,000 | 38,000,000 | 21% |
| 1962 | 184,000,000 | 37,000,000 | 20% |
| 1963 | 187,000,000 | 35,000,000 | 19% |
| 1964 | 190,000,000 | 34,000,000 | 18% |

On the basis of our present standards almost one-half of the nation in 1929, the most prosperous year between the two World Wars, would have to be classified as poverty-stricken. In contrast, by the end of World War II (1947) the indicence of poverty by these same measures (taking into account price level changes) had been reduced to less than one-third of the nation's population. This decline continued during the ensuing seventeen-year period so that by 1964 the overall poverty ratio had dropped to 18 percent. This represents a rate of decreased of approximately one percentage point per year and reflects the real economic progress of the post-war era. However, on the basis of this past record can we assume that poverty will be completely eliminated in the United States during the next eighteen years if nothing more is done by government?

Of course, one must remember that these statistics describe broad aggregates and do not reveal the class nature of our current poverty. Let us look at the general characteristics of the persons who constitute this disadvantaged group today. According to the Department of Commerce the population of the United States was estimated to be about 190 million in 1964. This total population represented about 60 million households of which, according to the estimates of the HEW, some 12 million were in a poverty status. In turn, these 12 million poverty households represented 7 million families composed of two or more persons, while about 5 million were unattached or unrelated individuals -- persons living alone. It also is interesting to note that, in addition to the 12 million poverty households, there were another 4 million household classified as borderline cases -- i.e., they were above the poverty level, but not by very much.

When these poverty households are translated into individuals, they represented some 34 million poor people, and if we add the borderline families, there were as many as 50 million people living under poverty conditions in the United States in 1964. This calculation is shocking in itself, but every more shocking is the fact that this poverty class, comprising about one-fifth of the nation's total population, contained more than one-fourth of the nation's total children, more than one-third of the nation's aged, and more than two-fifths of all Negro families. A classification of poverty families in 1964 by race, age and family structure is shown in Table II below:

Table II

NUMBER OF POVERTY HOUSEHOLDS IN THE UNITED STATES, 1964
(in millions)

| | Total | White | Non-White |
|---|---|---|---|
| Total Households | 11.9 | 9.1 | 2.8 |
| Unrelated individuals | 5.1 | 4.2 | .9 |
| Under 65 | 2.3 | 1.8 | .5 |
| 65 and Over | 2.8 | 2.4 | .4 |
| Families (2 or more persons) | 6.8 | 4.9 | 1.9 |
| No children under 18 | 2.3 | 1.9 | .4 |
| With children under 18 | 4.5 | 3.0 | 1.5 |

(Source: 1964 Economic Report of the President, p. 112.)

Since 1964 more detailed statistics with regard to the incidence of poverty have been reported in the annual Economic Reports of the President. Some of the major findings culled from these reports are shown in Table III below.

Table III

INCIDENCE OF POVERTY BY SPECIFIED
HOUSEHOLD CHARACTERISTICS, 1964

| | Poverty group as a percent of total number in specified category | | |
|---|---|---|---|
| | Total | White | Non-white |
| Total Households | 20 | 17 | 43 |
| Unrelated individuals | | | |
| Under 65 | 31 | 29 | 44 |
| 65 and Over | 59 | 57 | 79 |
| Families (2 or more persons) | | | |
| No children under 18 | 12 | 11 | 23 |
| With children under 18 | 16 | 12 | 48 |
| Non-farm Households | | | |
| Male head of household | 18 | 8 | 28 |
| Female head of household | -- | 31 | 60 |

It is apparent from the data that the incidence of poverty among Negro households and families in every category is significantly greater than for whites, in some instances as much as four times larger as in the case of Negro families with children under 18 years of age. Equally appalling is the fact that three out of every five Negro households in which a woman serves as the head of the family are in the poverty class. It is also widely recognized that there exists a very strong inverse correspondence between years of formal schooling and the incidence of poverty, as shown by the following tabulation:

| Families in which the education of the head of the family is: | Poverty group as a percent of total number in specified category: |
|---|---|
| 8 years or less of schooling | 37 |
| 9 to 11 years of schooling | 20 |
| 12 years of schooling | 12 |
| More than 12 years of schooling | 8 |

These data, of course, do not take into consideration differences in the quality of education or levels of educational achievement classified by race, but merely point up the general conclusion that the relative extensiveness of poverty is almost five times greater for the least educated as compared with those who have had some schooling beyond high school. Moreover, there are striking differences in non-participation in labor force and unemployment rates for poverty families compared with the nation as a whole. For example, when the national unemployment rate was 4.0 percent, the rate for the heads of poor families was only 6.0 percent; but the non-participation in the labor force rates for these two categories were 19 and 42 percent, respectively. In other words, the unemployment rate for poor families appears to be relatively low only because, once being caught in the vicious cycle of poverty, they are so thoroughly discouraged by the absence of job opportunities they withdraw from the labor market at a rate which is more than twice as great as that for the nation as a whole.

Can We Afford a War on Poverty? The United States today, as noted, enjoys unprecedented economic prosperity and affluence. The Gross National Product for the first quarter of 1966 was running at an annual rate in excess of $700 billion, and all three major categories of expenditures -- consumer, business and government -- hit all time highs. Of course, the latter excludes government "transfer payments," such as veterans' bonuses, interest on the federal debt, pensions and unemployment compensation since such expenditures do not represent the production of goods and services, but rather a redistribution of income. We rob Peter to pay Paul or tax A to benefit B. Moreover, it is widely believed that such public transfers all "trickle-down" from the rich to the poor when in reality money transfers move either "sideways" or "trickle-up." For instance, the interest on the federal debt, which is now about $10 billion a year and parenthetically larger than the total of New Deal spending in any one year of the Great Depression, primarily goes to high-income groups and not to the average taxpayer. Similarly, the farm subsidy programs primarily benefit rich and not poor farmers. For the economy as a whole government transfer payments in 1966 amounted to about $50 billion and averaged about 9 percent of the total personal income received during the past decade. But it should be clear that the major amounts of such transfer payments and subsidies do not "trickle down" to the poverty class. Thus, much of the social welfare legislation in our country -- such as anti-trust and labor laws, minimum wage and fair labor standards acts, social security, urban renewal, and farm subsidy programs -- has been primarily oriented toward helping the "great middle class" and not the urban and rural poor. In other words, it appears we believe in the welfare state for the middle class, but free enterprise for the poor.

In contrast to the foregoing analysis of government transfer payments, total expenditures on goods and services by all levels of government in 1966 (based on first quarter data annualized) amounted to $144 billion, of which amount about one-half was accounted for by federal spending, and the other half by combined state and local outlays. But of the $72 billion of federal expenditures, the bulk was for war and defense and only $17 billion was for civilian purposes. This latter figure represents less than 2 1/2 percent of our Gross National Product and in no single year during the past decade has federal civilian expenditures ever exceeded this ratio. In contrast, state and local expenditures have averaged about 10 percent of GNP. In other words, some 80,000 overlapping state and local jurisdictions -- states, counties, townships, municipalities, school districts and special taxing districts -- have the major responsibility of providing education, highways, hospitals, mental health facilities, and public welfare programs -- all the things that a government must do. It should be apparent that notwithstanding the popular beliefs and mythology

on this matter, the responsibilities and functions of government in the United States are not centralized in Washington, but rather are widely distributed among state and local governments which are spending at least four times as much as the federal government in providing civilian goods and services.

Now, let us take a look at the military budget because it is widely believed that the Vietnam War has created a "guns-or-butter" situation which requires cutting back on public civilian functions in order to finance current military operations. When we got into the Korean War in 1951, military expenditures were about 7 percent of the nation's GNP. At the high point of that war in 1953, when we had about the same number of American fighting men in Korea as we now have in Vietnam, the military expenditures were about 14 percent of GNP. Today, the federal government is spending $55 billion for its defense budget. This is approximately 7 percent of our GNP, and even if the escalated military activities forecast for next year result in a defense budget of $60 to $65 billion, it will still be less than 8 percent of the forecasted GNP. Obviously, this does not come close to the 14 percent military outlay of the Korean War period, and it is not at all evident that military spending is taking an increasing share of our Gross National Product. In other words, it appears that the unprecedented prosperous American economy can afford to wage both wars -- the War on Poverty as well as the one in Vietnam.

The question then arises: What are we actually doing to fight the War on Poverty? There are many government programs currently underway which do work toward a solution of the poverty problem in the United States today.

(1) First and foremost, it is absolutely essential that we keep the economy prosperous -- that we maintain high rates of employment which can be accomplished only by achieving high rates of stable economic growth.

(2) The next most important item on my list is not the poverty program but the civil rights program. To a large extent the absence of civil rights is at the heart of the poverty problem for at least one large segment of the population. This is why I have emphasized the incidence of poverty among Negroes. Racial discrimination which results in urban ghettos, lack of education, poor health, absence of skills and job opportunities, all tend to perpetuate poverty among this disadvantaged group. Poverty in these United States will not be eliminated until we have assured civil rights to all our citizens.

(3) Thirdly, regional development programs. There is a real need for the Area Redevelopment Projects, such as in Appalachia, since poverty is not distributed uniformly across the country.

(4) The Education Act of 1965. In this area let me point out to you that the tax burden for the support of education on local governments is unduly high , and only if the federal government makes a major contribution to the improvement of education, will it be possible to eliminate one of the major causes of poverty -- inferior and unequal educational opportunities for the disadvantaged.

(5) Medicare. Obviously this program will do much to decrease the medical disability of the aged poor.

(6) The Economic Opportunity Act of 1964. The OEO appropriation is actually very small. The total budget proposed for the Office of Economic Opportunity for 1967 is only $1.6 billion. This is only a little more than one percent of a total budget of $145 billion of public spending by federal, state and local governments. For Social Security alone the budget is $3.6 billion; but, as I have already suggested, such payments predominantly go to the middle class and not to the poor.

There are other federal programs administered by the Department of Agriculture, the Department of Labor, the Department of Health, Education, and Welfare, the Department of Interior, the Veteran's Administration, the Small Business Administration, the Railroad Retirement Board, etc., which have some impact on poverty in the United States, but by and large are predominantly oriented toward improvement of middle-class life. When we aggregate all the funds in the specific programs described above, they total $21 billion. However, the amount that can be identified as going to the poor is only about $8 billion. It is estimated that the 1967 GNP will be in the neighborhood of $760 billion and, therefore, the $8 billion will represent only about one percent of the nation's GNP.

As I have already indicated, it is becoming widely understood by responsible people in and out of government that our affluent society can eliminate economic poverty if it so desires. The basic problem is to allocate sufficient resources to this purpose. It is evident that it will require more than the present token effort which utilizes only one percent of the nation's productive output to help the 20 percent of the population constituting the nation's poverty class.

Professor Howard Higman

Professor Higman has been with the University of Colorado in the Department of Sociology since 1946. Prior to this time, he served on the War Production Board and in the Shipbuilding Division of the Department of Labor. He received his B.A. Degree at the University of Colorado in 1937 and his M.A. Degree in 1942.

Professor Higman served on the American Association for the Advancement of Science Commission on Air Conservation, 1962-1965; was a consultant to the Federal Republic of Germany in May, 1965; was selected as Guest Lecturer at the Salzburg Seminar in American Studies in 1950, 1951, and 1957; and lectured on American society at Cambridge University in England in the summer of 1953. He has been Chairman of the Conference on World Affairs held on the campus in Boulder each spring since 1948.

Recently, Professor Higman has served as a consultant to the United States Department of Labor and to the Office of Economic Opportunity and has been a consultant and lecturer to many groups and agencies on the War on Poverty. He is Director of the Action Research in Socialization Processes in the Institute of Behavioral Science at the University of Colorado out of which he has directed three VISTA training programs for the Office of Economic Opportunity and two training programs for Employment Security personnel on the management and operation of Youth Opportunity Centers.

THE ESTABLISHMENT
by
Howard Higman

You are aware of the fact, I think, that the War on Poverty is not unanimously received in the United States and that some Congressmen are seeking even to use the war in Vietnam as a device for curtailing or cutting back the expenditure of federal funds for the War on Poverty.

Now, what I want you to do is play like you are all members of the Rotary Club. You have invited me to talk to you and you feel hostile to the War on Poverty. I know that before I come and here is the sort of thing that I would say.

I want to say several things about the War on Poverty. I want to talk about why we have it, what it is, and what it is not. I want to talk a little bit about poverty itself and I want to talk about some of the solutions to the problems. I think that the reason we have the War on Poverty grows out of the Marshall Plan. That may seem a bit remote, but you will remember that until World War II our posture toward the defeated was one of victor toward vanquished. We imposed, after World War I, war debts on the defeated countries which led to economic autocracy, world-wide depression, and World War II. We thought we had learned from that experience, so, following World War I, we did a unique thing in the history of man in that we engaged in aid to the people we had been destroying. Through investing some eight billion dollars in the Marshall Plan, we restored Europe to economic health and we have benefited, in return, economically ourselves; for we have received some eighty billion dollars in trade as a result of the healthy economy of Europe. This led then to foreign aid programs generally and specifically to the Peace Corps. We ran around the world trying to fight elementary poverty and hunger when it suddenly occurred to us that there was, in our own midst, the equal of the poverty one would find in the Middle East, India, or Latin America in the Southwest part of the United States and in our urban cities' slums. So came the idea that we should turn our attention to that.

Now, some of you feel that the poverty program is Franklin D. Roosevelt all over again or the New Deal handout revisited and I want to assure you that this is not the case. Conditions couldn't be more different. The New Deal was started when this nation was on its knees in economic depression. Everybody was poor and it was a question of rationing and sharing the poverty. But in 1966 we have the richest affluent nation in the history of the world. Yet, in the midst of this affluence, we have approximately one fifth of the nation living in a state of poverty.

In fact, the poverty program is almost the opposite of the idea of welfare. It was designed to abolish welfare. It is not another form of welfare. It is designed to make people independent rather than dependent. The numbers of persons that are becoming increasingly more dependent in our country with second and third and fourth generation ADC mothers dependent on welfare is growing at an alarming rate. If this continues, you will be paying income taxes to support a portion of the population that is not employed. The poverty program is designed to break that cycle and reverse it, and to render people independent rather than dependent. At the present time the government has very many projects and different laws. The principle one, of course, is the Office of Economic Opportunity. In addition to that, there are laws in agriculture, labor, commerce, and economic development. There are the Employment Service, the MDTA programs, YOC, NYC, Work-Study programs, Head Start, CAP, Job Corps -- I would describe each of these programs, but you know what they are. I am not going to discuss them today.

I would bring out that last spring, almost a year ago, there were no Job Corps people. There are now eighteen thousand kids in the Job Corps. You will hear the argument made that it costs more to send a kid to the Job Corps than it does to a year at Harvard or that the Job Corps is simply a country club for juvenile delinquents. This shows a complete lack of understanding of the economic aspects of this problem. The kids in the Job Corps are pushed out of school (and I will have more to say about this in a minute) in the ninth grade. They are pushed out into the streets. At best, they are headed toward welfare; at worst, they are headed for crime and violence unless they are retrained and put into some employable situation. If one half of the kids presently enrolled in the Job Corps come out, earn wages, and support their families throughout their lives, this year one half of the Job Corps kids alone would make a contribution to our country in terms of the wages they would earn of four billion dollars. That is, with one half of the kids in the Job Corps -- fifty per cent failure -- you are going to get a return of four billion dollars, which is twice as much as the total appropriation for the whole poverty program. And that is just one half of one of the programs with which you are involved. Were these kids not to go out and make four billion dollars in the course of their lifetime (ten thousand people), they would cost you individually a minimum of $175,000 in welfare that you would pay in income taxes to support them. You cannot afford not to render these kids independent if you want to avoid paying their taxes.

At this moment, I would like to say a word about wages. Some of you are concerned about paying decent wages to farm workers. You feel that you profit by paying them low wages -- so low that they do not work. Then they go on welfare and you pay them still, because it is your income tax that pays their welfare check. So why wouldn't you rather pay them directly for the work they do than to pay them to not work as you do now. You can consider that when you are talking about wage rates.

I want to talk a little bit about poverty. In the Southwest the dominant problem of poverty is Spanish-American, just as it is the Negro in the South and in the urban centers of the East. So maybe it is worthwhile to make some generalizations about poverty and the Spanish-American in the Southwest.

Not all Spanish-Americans are poor. And not all poor people are Spanish-American. But it is necessary, nevertheless, to discuss this poverty problem that we run into with the Spanish-American. It requires understanding because you will hear things like, "They are indolent and lazy. They drink. They don't know how to use the things they have." This is no way to understand the problem. What you have to recognize is that the Spanish-Americans came to the United States before the Anglo-Saxons. They settled in the Southwest in 1593 and the Anglo-Saxons did not get here until 1620. They were the newcomers at Plymouth Rock. Then there was a change in Europe. There was the sinking of the Spanish Armada and the power shifted from Madrid to London. Like a backwash, the power switched in the United States from San Luis, Colorado, to Boston, and slowly the Anglo-Saxon culture spread and overtook the earlier Spanish culture.

Let us mention this Spanish culture. Historically in the Southwest, it was survival agriculture, not business agriculture. The Spanish-Americans engaged in agriculture to live. They did not sell it, trade it, or produce for others. They produced for themselves. They had land; they had cows; and they had sheep. They grew vegetables and cereals and they lived well in their eyes in this fashion. They were also Catholic. They were the kind of Catholic that you Irish Catholics in the room do not understand, because Irish Catholics are practically puritans. Their kind of Catholicism was the old pre-Luther type. It emphasized cooperation at the expense of competition. It emphasized the extended family at the expense of the individual. Thus, any man who acquired property by any device recognized that it was equally accessible to every relative, equally distributed -- the exact reverse of the ethics invented in Boston, Massachusetts, which is thou art not thy brother's keeper. Individualism enabled a few people to accumulate more, without which they would have died because there was not enough for everybody in the rigorous New England country.

The Spanish were patriarchal. The male father ruled the organization and loyalty was extended. They emphasized spiritual instead of material values. Man was not judged even by his cow or his donkey, let alone by his stereo set. He was judged by the kind of man he was in a vague spiritual sense in a closely knit family. These were wonderful values which worked very well in this agricultural setting. What happened was that the Anglo-Saxon revision came along. The first thing we did was take away their land. We did this first by means of law. We did not recognize the Spanish land grants at all. You go into a county court house and you will discover that there is no record of the Spanish land grant, only Anglo-Saxon ownership. The Anglo would come along and say, "Get off my land." There was gunfighting involved, but ultimately the land was taken away. What was not taken away by deed was taken away by water rights. The Spanish thought water was just water, but they found that water was owned by Anglo-Saxons and sold. They didn't have any. What the Spanish did not lose by water rights, they lost by taxes because of the different tax system. The Anglo-Saxons taxed on the basis of acreage; the Spanish taxed on the basis of the productivity of the land. In a lean year if nothing was produced, there was no tax. In a good year, there would be a tax.

So the Spanish-American was rendered an agricultural employee. He worked for an Anglo-Saxon employer at a subsistence level; then, he was replaced by peons from Mexico (braceros) who could work for even less than he could. Now, he is being replaced by machinery. In the San Luis Valley, for example, I saw potato farms where, some years ago, the Spanish workers who planted the potatoes were replaced by a potato planter; later, they were again replaced by a potato cultivator; and still later, they were replaced by a potato digger. All they had left to do was sort out potatoes from rocks, wash, grade, and pack the potatoes. Now, they have great sprinkling systems that move automatically over a whole section and irrigate the farm with no employees. I saw a machine that separates rocks from potatoes by air pressure. It is sort of a vacuum cleaner system wherein the potatoes come out one end and the rocks come out of the other. The potatoes are washed, graded, and packed into sacks without being touched by a person.

What do these people do as they leave these places? With the declining use of agricultural employment, they migrate to the cities. They arrive in Denver, Kansas City, Los Angeles, Chicago -- broken down from agricultural work with emphysema or whatever and with no skills whatsoever that can be employed except for occasional stoop labor or unloading a semi or something like that. He cannot get a job. He moves in with his cousins for awhile. They cannot eject him; they are an extended family. His son, who has been pushed out of school in the ninth grade, cannot get a job either. It turns out, however, that his wife can. She can get a job as a domestic, a maid cleaning house in an Anglo-Saxon's house. So, for the first time, this proud patriarchal man finds himself living off a woman. His daughter can get a job too, probably working in a hand laundry. He gets up in the morning, goes down to the employment office, and more often than not is turned down. He goes around the corner, drinks some wine, waits until 4:40pm, goes home, and waits for his wife to come home and be a housewife for him.

Here, I discovered the distinction between an alcholic and a drunk. An alcoholic is a person who is not at work because he is drinking, and a drunk is a person who is drinking because he is not at work. They are not similar.

Now, I want to talk a little bit about the question of the opportunity structure. We tend to rationalize a person's not working on the grounds that he lacks motivation. That is one way of looking at it, but it is not a useful way. The useful way to look at it is to look at it as the inadequate opportunity structure. The concept of an opportunity structure is external as opposed to the motivation, which is a way of looking inside persons. The concept of motivation begins to direct your action toward rationalization rather than action. In essence, a motive is inside a man and there is nothing you can do about that. An opportunity structure is something around him and there is something you can do about that. This is the reason why you should use the concept, "opportunity structure" rather than "motivation."

I talked to a lawyer in Washington and she said, "You can't talk to these people. They are not motivated." I asked, "What do you mean?" She said, "Well, I had a girl who used to clean for me on Saturdays and Sundays and she won't anymore. The girl said, 'I don't want to work for you. I have to report my earnings that I get from you and they deduct it from my mother's welfare check.'" I replied, "You call that lack of motivation? I don't know a General Motors executive who would be willing to work to increase the family budget exactly zero."

The idea of motivation as opposed to opportunity structure, I think, can be easily explained to you. I have a boy in mind. His father has never had a steady job; his uncle has never had a steady job; his cousins and brothers have never had steady jobs. "Besides, steady jobs would interfere with hunting and fishing," says the boy. So <u>you</u> say that he is lacking motivation. What I am saying is the thing that is wrong is the opportunity structure. The way that I can make this clear to you is this:

What do you think are my chances of becoming President of the United States? . . . . I know what you are thinking, and I don't like it. I will tell you something else. I am willing to be President. Now, I will ask you something else. What do you think would happen to me if I went around the halls of the University campus saying, "How do I get to be President? Will you help me get to be President? I want to be President." Well, I know what would happen to me, so I don't do this! It is the same situation with this boy. It would be just as stupid for him to say, "I want a steady job," as it would be for me to say that I want to be the President in terms of the experiences he has had. It is very illogical to aspire to get there when there is no way from here to there. And it is the way from here to there that I am calling the opportunity structure.

We say that they do not have the same values as we do, but actually it turns out that they do. And it is not that their values are so high, it is that ours are <u>not</u> any higher. What <u>you</u> want is health, a job, a home, recreation, money enough to buy food, tickets, and all of the things that we are used to. And these are the same things that they really aspire to.

I want to talk now a bit about schools. I am fond of saying that the problems of poverty are, the result of our myth that we live in a classless society. We design middle-class institutions and put people in them for whom they are totally inappropriate. When they do not fit, we kick them out and ask them politely to vanish. Last year in the City of Denver (and oddly enough it has the same rate as the national average) thirty-three per cent of the kids who entered the first grade were kicked out of school before they graduated from high school. One third! One out of three! This number is increasing. We call them "dropouts." This is for self-protection. I say that they are "pushouts."

That brings me to the question of the Head Start program. The biggest pay off will come in working with children from zero to six. This does not mean that we should not work with those from six to twelve, sixteen to twenty-two, twenty-two to forty, forty to sixty, and sixty-five to ninety, but the big pay off is from zero to six. The work of Dr. Benjamin Bloom of Chicago gave great impetus to the discovery that most of the things that we think of as intelligence are learned by the normal brain after the baby is born. We recognize physically retarded children by their systems at birth, but I am not talking about that. It is the ninety per cent of us who have no physical defects at all who either do or do not learn to be intelligent by six years of age. If we bind your eyes after you are born, when your brain turns to the subject of learning to see, you will be blind. You do not see when you are born; you learn to see after you are born. You learn to hear after you are born. You learn to conceptualize, to visualize, to have the environment around you be differentiated to the great many things that you and I can see and respond to.

I am thinking of the little kid who was born in a brown dirt house with a brown dirt floor with a brown dirt area in front of the house and a brown dirt road in front of that. When he was one year old, a sister was born. He was no longer the baby. When he was four years old, he had two children younger than he in the family. For occupation he walked around and around his house and threw rocks and that is absolutely all. We said that he speaks Spanish. He did not. He had no vocabulary whatsoever, except, perhaps, three words, "gimme," "dis," and "dat." That was the totality of his vocabulary. He had never seen a pair of scissors, a spoon, a fork, or a knife. He had never sat at a table; he had never eaten a meal sitting down or seen people eat a meal sitting down. He lived in a house full of people doing all of the things, in his very presence, that people do in spaces and corners of the space.

This little boy had never seen a bottle cap. He had never seen a crayon. He had no conception of color -- red, white, or blue. He could not recognize them or differentiate them when shown colors. He had never been shown a color. He had never even read a fairy tale. He did not know the words, "once upon a time," or "let's pretend," and you and I know that in order to get a job, you have to know the words, "let's pretend." "Let's pretend that I have the background that you are looking for." This is more serious than you think. His stance was rigid and fixed because he did not have the variety of experiences that your children and mine have had by the time they are four years of age.

The most horrible thing we discovered when he came to school was that he did not have a name. When he got off the bus and the teacher said, "Horace," he did not respond. He did not know the name. We call this "tuning out." He was never called by name at home and when he was, it was never good news. Most of the things that were said around there were not meant for him. You do not hear an elevated railroad train when you live under one unless it does not run. So this child had no name at all. And when he learned that he had a name, he got terribly excited about it. He was taught his name. When he got off the bus each morning, the teacher would say, "Good morning, Horace Trujillo," and he would say, "Good morning, Mrs. Hunter." She would say, "How are you?" He would say, "I am fine. How are you?"

Then we discovered that he did not have a face. We took colored photographs with a polaroid camera of groups and asked him to find himself. He could not find himself in the picture. We put little mirrors up on the wall with pictures around it and let the kids walk up and look at the pictures and then in the mirror and finally he found himself. He was terribly excited. He said, "Here I am!"

Then he learned about colors. They read fairy tales to him and he learned about words, like chair and table and all kinds of things. He learned context. He saw the world open up in front of him because he had words for things. Oranges were not bananas and bananas were not oranges. He tried all kinds of words like "carrot stick" or "a stalk of celery," or a "deviled egg" -- things he had never even seen before. With words came conception of the sight of the thing itself. The brown world out there suddenly started to have things in it. It did not have things in it before.

Now, we have to follow this up. The hope is that this kid, when he goes to kindergarten, will treat the teacher very differently from the kid who went there the way I described him. Traditionally this kid went to school with no concepts. He sat in the back of the room. The teacher did not understand him. She did not know what to do with him. She gave out her lessons. He didn't seem to cooperate. He did not seem to care. She did not know that he could not hear her. He was a "deaf mute," if you like.

A good classroom is one that is quiet and consequently the teacher has to have a quiet classroom. In other words, it is a form of jail in which kids sit in the first grade in jail and are passed onto the second grade in jail, the third, the fourth, the fifth, the sixth, the seventh, and the eighth grade. In the ninth grade it is possible legally to kick them out and so we do. They have a certificate showing that they passed eighth grade English, but when we test them, they show that they have second grade English. They have been engaged in what we call "social promotion." They have not been educated, but babysat. The rate of truency is announced and everyone sort of winks at it because "they don't get any good from school anyway."

Of course, they have a special language of their own by the time they are in the ninth grade. For example, they have a word -- a four-letter word for excrement. They use this word and the word has meaning to them. The word means "nonsense." The kid says to his English teacher in the ninth grade, "That's a lot of 'nonsense.'" (Incidentally, this word is used only by lower-class boys and upper-class women at cocktail parties.) We know of one kid who said this to his English teacher and got kicked out of school. He entered a remedial training program. Unfortunately, they hired the same teacher to teach in this program and the next thing you know, the kid said to her, "I think you're 'nonsensing' me." He was kicked out of the school for dropouts.

Fifty years ago, you did not have to go to high school to be employed. There were all kinds of things for non-computing people to do. For example, there were roads to be built, ditches to be dug, and things to be sold off counters -- simple things like cokes and cigarettes and newspapers. What has happened is the steady automation of our society. Today, when you see a highway being built, a great yellow monster is rolling down the road rolling out a highway. Sitting on top of the monster is a man getting $5.00 an hour. He is there instead of three or four hundred men with shovels. Or you see a machine digging a ditch and burying a telephone cable. It is here instead of three or four hundred men with shovels. Any time you put a nickle or a dime or a quarter or any combination of coins into a machine like a coke machine, I want you to say, "There stands a 'non-job' for a non-verbal boy." It is spreading out all over everywhere. It is increasingly no longer possible for these people who could succeed with effort and work to do so in the modern urban world.

Kids are also kicked out of school because of money, although I think that language is the primary reason. I saw a girl who could pass her tests in high school and when school started last fall, I said to her, "Isabelle, how come you're not in school?" She said, "Oh, I went over, but they wouldn't let me register because I couldn't pay my book fees. I have to pay $13.75." Her mother has seven kids and that

amounts to tuition about like a small junior college for that family. What is more, the Anglo-Saxon teacher unthinkingly says, "Bring a $1.50 tomorrow for copper wire for the science project." "Bring 75¢ for a ticket for the museum tomorrow." "Bring $17.50 for a letter-jacket." The kid is proud and she cannot afford to go to school. We should make it absolutely illegal to say that we have free public schools and then turn around and charge tuition. In Denver they even had two kinds of tickets for meals. The kid who was willing to say, "My dad is on welfare," got yellow tickets instead of blue ones. He got his hot lunch for a quarter instead of fifty cents. But he didn't want a yellow ticket because he is proud. In fact, when we ask these kids, knowing that their fathers are on welfare, "How many of you kids' fathers are on welfare," they do not put up their hands. They have pride and I am proud that they have pride.

I went into a library in a small town. I saw no Spanish-Americans there and I said to the librarian, "I see no Spanish-Americans here." She said, "Oh, we don't have any trouble with that element." I said, "What do you do?" She said, "I just pull out this little card and have them read it." It says something about the antidisestablishmentarianism before the interrorem . . . ." She told them, "When you can read this you can charge out books." In another instance in a library I asked, "How are books checked out?" The librarian said, "We have to know whether they have a c+ average in high school and then they can use the library." In a third library they can charge out books when they bring a certified tax receipt that their father has paid property tax. Here are our public institutions, the libraries, dealing with our illiterate population and we wonder why they are illiterate.

In sociology we have a name for this. We call it "systemic enertia" and, unfortunately, it permeates the employment agencies. It permeates the welfare departments. It permeates the University of Colorado. And I will take the blame for it. It is the universities themselves in which bureaucracies are born. And the bureaucracies come to have a stable relationship in which the caseworker needs the client as much as the client needs the caseworker.

I am fond of a story about the social worker who was standing on a pier when a woman fell off into the water. He watched her as she went down and came up. He watched her as she went down and came up once again. He watched her as she went down and came up a third time, yelling "Help!" He grabbed her, gave her artificial respiration, and said, "Thank God, you asked for help."

You hear that the poverty program is confused. To that all I can say is that I hope so. All the order we have been able to engineer in our country in the last fifty years has produced the poverty. We need confusion. You might say that the problem is too great for professionals to handle, for professionals need survival and amateurs need success. We hear that the poverty program is full of politics. Politics is the struggle of power. Politics is described as who gets what, when, where, and how and the things that he gets are definite goods, deference, and security. If the poverty program is not full of politics, it will fail. It is the most political thing I can think of. Every program that has started and failed is information about what not to do and we have got to have lots and lots of experimentation and change. It is not a matter of squandering money because the way we were going would have cost us billions and billions of dollars more in sheer cost.

Some people object to the fact that in the poverty program, it is required that the poor people themselves participate in planning what is going to be done to them. For some mysterious reason a horrible word has arisen called, "indigenous persons." They might better be called, "indigent persons." They say, "Well, if these people know so much about what to do for themselves, why didn't they do it to begin with?" This is not quite right. They know their problems better than we do. They are a proud people and the reason they are proud is that you don't have to have money to be proud. It is better to have money, but if you do not, you can at least have pride. So a lot of the people who need help find it the hardest to accept or the hardest to admit or the hardest to define in respect to the entire need. At best, you learn from having them in your midst in planning committees and projects. At worst, at least they will be able to go back and tell people what you are doing and, thus, prevent the rise of rumor and fear. People who have been bantered about and hurt and injured for years are likely to be very responsive to false rumors that they are to continue to be exploited and injured. So the minimum good that comes from the poor being there is the communication link between their group and yours.

The kind of thing that I am talking about is illustrated very well, I think, for you by our traditional way of dealing with unwed mothers. In Denmark if a girl becomes pregnant, she is moved into a dormitory like Sewall Hall on the CU campus. Her children are cared for in a nursery school. She is encouraged to go out and learn to read, spell, write, file, type, practice law -- whatever she can. If she finds the father of the child, she is encouraged to bring him home or if she can find any man to come home with her, she is encouraged to do so. Within four or five years, she, the man, and the child or children are out, independently living on a better level of living in Copenhagen -- not on relief in a family without a father.

The causes of juvenile delinquency are complex and partly unknown. But of all the available information, the one most consistent fact about the juvenile delinquent child, and later criminal, is that he lives in a home without a father. And this is true with girls as well. Girls without fathers are more

likely to end up in a girl's reformatory than girls with fathers. The reason is the absence of the father figure. What can we do? What we have been doing is this: We take the girl and we say, "We will pay you so much money provided that no man comes within ten miles of you, including the father of your child, and providing that you report every nickel you make of any kind so that we can deduct it from your subsistence." Well, that is not the kind of opportunity structure that leads people to marriage, stable homes, and work. At midnight welfare workers have been going through public housing projects doing what they call, "flushing," looking for men's shoes under the beds and if they find any, chasing them out of the building. This results in cases of men, who love their wives and children, merely to make their familiy eligible for subsistence so that they can get food for the kids, artificially deserting their family. They maintain a separate residence in order that the condition can prevail. In that environment up grows the child who is headed straight for the reform school.

These are the kinds of patterns of systemic inertia that the poverty program is designed to reverse. We can no longer afford to support programs which simply supplement, augment, and carry on the great handout.

Professor Clark S. Knowlton

Dr. Knowlton secured a B.A. Degree in Sociology from Brigham Young University in 1947 and an M.A. Degree in Sociology from the same university in 1948. He then traveled to Sao Paulo, Brazil, where he worked on his doctoral dissertation at the Escola Livre de Sociologia y Ciencias Socias, receiving his Ph.D. Degree in Sociology from Vanderbilt University in Tennessee in 1955.

Professor Knowlton has taught at several universities -- Vanderbilt, Georgia Southern College, New Mexico Highlands University, and Texas Western College where he is presently a Professor of Sociology.

Dr. Knowlton has done extensive work with Spanish-Americans in New Mexico, particularly in San Miguel County, and he has published several articles on the history of Spanish-Americans and their economic and social problems. He has also traveled and studied in Argentina and lectured at the Instituto Chihuahuense de Estudios Sociales in Chihuahua, Mexico.

Professor Knowlton has recently received a grant for the development of programs to reduce juvenile delinquency and to experiment in the development of programs to socially organize four Mexican-American slum neighborhoods.

CULTURAL PLURALISM AND THE SOUTHWEST

Clark S. Knowlton

It is a personal pleasure for me to have the opportunity of discussing with you the philosophy of cultural pluralism with special reference to the Spanish-speaking people of New Mexico and Colorado. The Southwest is one of the finest cultural laboratories in the United States for the study of cultural contacts, the adjustments of varied cultural groupings to an arid land environment, the recent processes of urbanization and industrialization, and the long and complicated interaction between the Anglo-American, the American Indian, and the Spanish-speaking populations.

The Southwest is one of the oldest and yet youngest regions in the United States. It was the first area to undergo permanent European settlement. The Spanish colonizers were moving into the Rio Grande Valley in the 16th century. It was the area where the native Indian population first began fighting to preserve their lands and independence from the Europeans, and the last region where Indian fighting came to an end. There are still people living who have heard the whistle of an Apache bullet or seen the sun glint from the blade of a Commanche lance. Although Anglo-American trappers and mountain men had reached the Southwest early in the 19th Century, it was the last to be effectively occupied by the Anglo-Americans.

Before the middle nineteen-twenties the border between Mexico and the United States was poorly marked and patrolled. People and ideas crossed the border both ways freely and without hindrance. Even today, there is still large-scale migration of Spanish-speaking people northward into the United States. The border here does not separate two strongly different nationalities as borders do in much of the world. The United States-Mexican border runs through an area marked by the same geographic conditions, the same Spanish-speaking people, and the existence of twin cities all along the border from California to Texas. In both Mexico and the United States population is moving toward the border. A fascinating border culture is threatening to come into existence in both Mexico and the United States that deserves far more attention from social scientists than it has yet received.

Three Cultures. The Southwest is marked by a vigorous interaction between three lively cultural traditions, the Anglo-American, the American Indian, and the Spanish-speaking. The presence of the Indian is strongly felt in New Mexico, southern Colorado, Arizona, and Utah. The names of the mountains, the rivers the states, counties, and cities offer effective testimony to the presence of the Indians, the Spanish, and the Mexicans. The basic crops of the Southwest were all introduced by the Spanish. The Spanish and Mexicans are responsible for the methods and techniques of working sheep and cattle. They also opened the early mines and industries and taught the Indians many arts and handicrafts. Without the early efforts of the Spanish and the Mexican, Anglo-American immigration and invasion would have been far more difficult than it actually was.

To understand the attitudes, the values, and the present economic and cultural conditions of the Indians and the Spanish-speaking groupings in the Southwest, the modern Anglo-American must know that his history books do not reflect an accurate account of Southwestern history. These books delineate what could be called the official Anglo-American historical line. This Anglo party line obscures and conceals the harsh experiences of the Southwestern Indian and the Spanish-speaking people during the period of Anglo-American invasion and settlement.

Those of us who have worked with Indian or Spanish-speaking people soon become aware of the fact that there exists oral Indian and Spanish versions of the history of the area. These versions are passed down from one generation to another through stories, legends, historical accounts, and folk music. These accounts are all in basic disagreement with Anglo-American histories. It is unfortunate that no modern Indian or Spanish-speaking historians, essayists, poets, or novelists have come into existence as yet to relate for us the viewpoints and experiences of the Indian and the Spanish-speaking under the lash of Anglo-American conquest.

For example, most Anglo historical treatments of the period of Anglo-American occupation tend to slide over the actual events of the era. They state that the American conquest was fairly orderly, that apart from the Indians it met with little resistence, and that it enjoyed at least the acquiescence of the local Spanish-speaking inhabitants. This account is not true. The Spanish-speaking people resented the coming of the Anglos. They were ashamed of the little formal resistence offered by Mexican troops. They maintained guerrilla warfare against the American army of occupation for several years. Quite a few Spanish-Americans in New Mexico were hanged or shot by the American troops in the course of numerous rebellions and plots. Hatred toward the Anglo-American has continued to exist as a deep dark lake of resentment and bitterness among the Spanish-speaking people from the days of the early conquest until the present time. Violence between Anglo-American and Spanish-speaking runs like a red stain through Southwestern history. It still sputters on in some areas today in southern Colorado and northern New Mexico. Were it not for the full force of Anglo-American law enforcement more violence in these areas would break out.

The reason for both the antagonism and the violence is that the American Indian and the Spanish speaking groups were forced to become American citizens against their will. They were both conquered in war. The rights of both groups were guaranteed by treaties that were broken as soon as they were signed. The Indians and the Spanish-speaking populations were treated as conquered peoples with few civil or property rights that needed to be respected. The coming of the Anglo-American for both has meant dispossession from their lands, economic exploitation, cultural oppression, discrimination and segregation, poverty, and a low economic and social position in the social structure of the Southwest.

The Indians in the Southwest have, however, survived in larger numbers and in a better economic and cultural position than the Indian tribes in other parts of the United States. Around twenty different tribal groupings have managed through many centuries of constant struggle against the Spanish, the Mexicans, and the Americans to preserve their tribal integrity, their tribal organizations, their native languages and religions, and their basic core values. Although they have suffered severely from loss of land and independence, they have managed to survive intact into the twentieth century.

The last few years have seen a growing Indian tendency to break free of the culture shock caused by white conquest. Indian nationalism is growing. Indians are now voting in greater numbers, and a few are beginning to run for public office. They are slowly learning the mechanics of the American political system and may be able to manipulate it for their own benefit as other groups have done. There is a more insistent demand among the Southwestern Indians for the right to control their own tribal affairs free of federal and state controls. Many young Indians are taking a long cold hard look at the structure and characteristics of Anglo religions, values, and behavior patterns, and they are beginning to reject much of what they see. As the Indians do have the highest natural rate of population increase in the Southwest, their position in the future political, economic, and cultural life of the Southwest will be much stronger than it is now. The Indians are finally moving from the long cold hard bitter night of apathy and cultural shock into the dawn of a new day in which both the Anglo and the Spanish-speaking will be forced to move over to make room for the new Indian.

The Spanish-speaking minority of the Southwest and the Rocky Mountain States has been referred to as the "sleeping giant." It is still largely quiet and shrouded in apathy and poverty. No militant associations have yet come into existence. The leadership of the major ethnic organizations is largely middle class, anglicized, and conformist. It has very little contact or acceptance by the rural or urban groups of Spanish-speaking origin.

The present period of calm is not apt to last many more years. The first faint rumblings of thunder are already breaking along the horizon. If the dominant Anglo-American groups are willing to make the necessary social, economic, and cultural adjustments to improve the present situation of the Spanish-speaking people of the area, the storms will pass on overhead after dropping a refreshing rain of social and economic change that will improve the whole Southwest. If the Anglo-American leadership is not willing to make these necessary adjustments, the storms will turn into hurricanes that will beat with ever increasing violence against the poverty, the discrimination, and the cultural intolerance that hem these people in. Militant organizations will come into existence over night. A new generation of non-conformist leaders will appear. There will be organized protests, demonstrations, picketing, and perhaps violence.

It is rather difficult for Anglo-American administrators, planners, social agencies, and for the general Anglo-population to accept the fact that the basic Anglo-American cultural values, goals, and beliefs are not shared by the Indians and the Spanish-speaking groups. Millions of dollars have been wasted and many well designed programs have had little success because Anglo-American planners and administrators did not take the minority values and attitudes into consideration. Perhaps the most serious obstacle in the path of Southwestern progress is the reluctance to develop plans within the cultural framework of the minority groups.

Some Feel Superior. Ethnocentrism, or the tendency to believe that one's own language, culture, religion, or ethnic grouping is superior to all others is as old as mankind. It is found among simple preliterate tribal groupings as well as in technologically advanced societies. It is found among American Indian, Asiatic, and African tribal societies as well as among the ancient Egyptians, Babylonians, Greeks, and Romans. Today it exists among Americans, Germans, Russians, French, Chinese, Arabs, Indians, and other nationalities. Unfortunately, this attitude has been accompanied by the belief that if one's culture is superior, then one has a divine mission to civilize the rest of mankind by all methods including force and violence.

No one can estimate how many millions of human lives have been destroyed, the floods of human anguish that have been released, or the numbers of refugees that have had to flee their homes by the rising tides of nationalism, ethnocentrism, and beliefs of cultural or national superiority. As man has become more civilized, the more deadly has become his behavior toward his fellowmen. The nineteenth and twentieth centuries have been marked by more destructive wars, more mass murders, more refugees, and more physical destruction of cities and towns than almost any other historical period. Today we have brought ourselves to the very brink of human anniliation.

Nationalism and Minority Cultures. As modern nations consolidated out of the flux of the middle ages, those of Europe and now increasingly so those of Africa and Asia have adopted the idea that each nation should have but one standard language and culture. Those elements of the population that might have a different culture or language should give up their native language and culture for that of the dominant group. Those minorities who are reluctant to do this are regarded as dangerous and potentially subversive elements that must be coerced or eliminated. Only Switzerland has so far been able to develop a viable multi-lingual society.

Many techniques have been used to solve the problems posed by the existence of minority groups. One of the more universal has been the practice of genocide. The elimination of the American Indians by the Anglo-Americans is perhaps a local illustration. No matter how the Indian tried to adjust to the waves of oncoming white settlement, he was lost. Those tribes such as the Sioux, the Kiowa, the Commanche, or the Apache, who fought to the end were decimated. Other tribes such as the Cherokee, the Choctaw, or the Creed who took over those aspects of the Anglo culture that were superior to their own and developed a mixed culture that in many respects was superior to that of the white frontiersmen around them, were still forced off their lands. Herded like dying cattle by American troops they followed the trail of tears to Oklahoma. It was the Indian equivalent of the Bataan death march. Estimates are that over one third of the Indians who started the march died on the way from starvation, disease, brutal treatment, and murder. A few small tribes such as the Delaware had villages that became Christian and anglicized. No matter, in times of stress the villages were destroyed and their inhabitants massacred by the white settlers around them.

The martyrdom of the Indian has persisted into our own day. Laws were passed that, until recently, denied the Indian the right to practice his own religion. Indian agents were given the powers of petty directors and interfered with every aspect of personal and group life. Whenever any special Anglo interest groups wanted Indian land or natural resources, the Indians lost their possessions. The federal government and the state governments have continuously tried to erode away the power of tribal organizations, control the selection of Indian leaders, and manipulate Indian tribal funds.

Even today the Indians have not been given their basic democratic rights of deciding for themselves what they would like their future to be. Congress and state governments are still pressing hard for the elimination of the reservation system, the relocation of Indians as individuals in urban slums, the destruction of tribal organizations, and the total acculturation of the Indians into the Anglo-American population. No one seems willing to grant to the Indians the right to remain Indian, to preserve their culture, to expand their land holdings, and to maintain their reservations, if they so desire. Perhaps the Indians will be forced to resort to all the methods employed by the Negroes in their civil rights movement before the voice of the Indian is heard and respected in the Southwest.

Another common method used in many nations to eliminate undesired minorities was to expel them. As the five civilized tribes were driven out of the South so the Mormons were expelled from Missouri and Illinois. Millions of Germans were forced out of their villages and towns in eastern Europe. Hindues and Moslems by the millions have had to flee their homes in India and Pakistan. The Jews during the entire Christian era have been forced into exile from one Christian country or another. The end is not yet in sight, as the twentieth century seems destined to be known as the century of refugees.

And still another popular method used to eliminate minority cultures and languages is to prohibit their expression by law or by custom. During the Prussian occupation of Poland, every effort was made to Germanize the population. The use of the Polish language or public expression of Polish culture was severely frowned upon. The Irish and Highland Scots suffered from similar efforts by the British. Minority groups in Russia are facing a systematic campaign to Russify them. In the United States, efforts to develop written Indian languages have been hampered by the attitudes of the Indian Bureau, Christian missionaries, and the general cultural attitude of the area. Many states ban teaching in any non-English language. Colorado, however, recently repealed its law.

Serious concern about the impact of immigrants upon American society did not develop until after the Civil War. The great mass of early immigrants such as the English, the Germans, and the Scandinavians coming into the United States before and during the Civil War moved into the rural areas in search of free land. They were not as apt to compete with native labor as later immigrants. Furthermore, many states anxious to increase their population paid part of the cost of immigration and gave many facilities to immigrating groups. This first great wave of immigration was welcomed in general and not regarded as a threat to national security or to the national culture.

Minorities in the United States. The United States is a nation formed by immigration. Our language and our basic political, economic, social, and cultural framework with some modifications came from Great Britan. Those immigrant groups whose cultures and languages were fairly close to those of the dominant Anglo-American group faced few economic or social restrictions. They were able to move up the social and economic ladder. Other immigrant groups with cultures and languages that were sharply different from those of the majority grouping faced discrimination and prejudice. Perhaps the Indian, the Spanish-speaking groups, and the Negro have been close to the bottom of the national socio-economic structure.

The first important wave of discrimination and hostility against immigrants developed with the coming of the southern Irish in the mid-nineteenth century. The mass of Irish immigrants were illiterate, unskilled rural workers fleeing from hunger, poverty, and exploitation. The vast majority piled up in the slums of the eastern and midwestern cities. Differing in religion, culture, and dialect of English from the masses of resident Americans, they became the object of scorn, prejudice, discrimination, and of serious concern over their impact upon American values and social institutions. The Irish were followed by the Italians, Polish, Jews, Yugoslavs, and other groups from eastern and southern Europe. These groups, easily distinguish-

able from the older American stock, increased the fears and anxieties of American workers forced to compete with them for employment and of middle-class Americans fearful about the survival of traditional American institutions.

The Melting Pot or Pluralism? Two basic and somewhat conflicting philosophies developed among Americans worried over the massive immigration of the late nineteenth and early twentieth centuries. One is known as the melting pot philosophy. The advocates of this theory urged that immigrant groups should "melt" or "blend" into the general American population. This would be accomplished as the immigrants learned English and acquired American cultural values. In the process the general American culture, enriched by contributions from the immigrants, might well become one of the richest and most creative in the world. The other philosophy for lack of a better term can be called the philosophy of Americanization. It rests roughly upon the ethnocentric idea common around the turn of the century that the United States had developed one of the most advanced and progressive world cultures in the area of technology, morality, democratic freedoms, and economic progress. As the American culture was clearly superior to immigrant cultures, immigrant groups entering the United States were under the obligation to Americanize as soon as possible. Americanization was understood as the process by which the immigrants would abandon their native languages and cultures as rapidly as possible. Those immigrant groups who were reluctant to do so were potentially subversive elements that were dangerous to national unity.

The idea that an immigrant group could become loyal citizens of the United States while preserving its native language and culture did not spread widely until after World War II. This concept gave birth to what is known as the doctrine of cultural pluralism. Its basic premise is that minority groups should learn English well in order to function in American society. They should also acquire enough knowledge of the basic political and social institutions of our society to enable them to earn a decent living, defend their basic rights, and to participate as American citizens in the common endeavors of our national life. None the less, they have the right to preserve their group identity, their language, and their basic cultural values and institutions. No other group of Americans has the right to exert pressure upon them to give these up. No intimidation, force, or the application of social, political, or economic pressures such as those used against both the Indians and the Spanish-speaking should be permissible in a democracy.

Cultural pluralism as an ideal accepts the fact that some minority groups may not want to give up their language, and culture. As long as members of these groups are loyal to the United States, their desires to preserve their linguistic and cultural independence should be respected. Minority groups should have the right to determine their own future. If they desire to maintain their language and culture, they should be given every facility to do so. The schools in their area while emphasizing the teaching of English and basic American institutions provide room in the curriculum for culture. The members of any minority group who wish to acculturate should also be given every assistance to facilitate their adjustment. The basic choice should be one that the minority groups themselves make.

The advocates of cultural pluralism argue that the costs of the melting pot and Americanization philosophies have been extremely high. Millions of immigrant parents and their children have paid a high price in personal and social maladjustments because of the cultural intolerance of the dominant society. These advocates point out that large numbers of first and second class immigrant groupings lost their native values under the impact of adjustment to the new cultural environment without acquiring the core values of American civilization. They put on the external cultural characteristics without ever understanding the basic values that gave meaning to the culture. Caught between two cultures, they became a marginal grouping without basic values. As a result, they turned to materialism, the kick philosophy, and found escape in delinquent and deviant activities. Many became totally alienated in a world that they never fully understood. The philosophy of cultural pluralism would have smoothed the path of immigrant adjustment and minimized the amount of anti-social behavior.

Cultural Isolation. Cultural pluralists also point out that many Americans are extremely parochial in their attitudes. Very few speak any foreign language. The majority know very little about the history, the geography, the literature, or the basic cultural values of other nations and peoples. Americans as a general rule shrink from intimate contact with foreign groupings. The result is that Americans have singular problems in gaining the friendship and goodwill of other peoples.

This is well illustrated by the behavior of American civilian and military personnel overseas. They isolate themselves in cultural islands or American ghettoes. They associate almost exclusively with other Americans. Their children attend American schools. They buy in American supermarkets and live in American housing. The only contacts they have with the native population is with servants or merchants. The local people see the Americans driving large cars, getting drunk in bars, and moving around their cities in timid clusters. There is virtually no intellectual or emotional involvement with the local people. The Americans tend to develop strong prejudices against the local inhabitants that are well reciprocated.

My experiences in Brazil brought this home to me very strongly. I went to Brazil in the early 1950's to study at a branch of the University of Sao Paulo and to work on my doctoral dissertation. Upon arrival, I reported to the American consulate. Members of the consulate were quite helpful and helped me find a place to stay. I soon came to know the American colony fairly well. One evening I was invited to attend the Anglo-American club by a small group of American businessmen. Most of these men had been in Brazil for many years. I asked them what they thought of Brazil. Their answers shocked me. "Brazil is a terrible country." "The government is impossible, and the people are immoral." "Brazilian employees are corrupt and untrustworthy."

As I watched and listened to these Americans with their large American cars, their luxurious homes and staffs of servants, their high salaries, and their executive positions, I reflected that they were attacking the country that made all of this possible. I firmly resolved that when my wife came to Brazil, we would move into a middle-class Brazilian apartment house, live as Brazilian middle-class people, and participate fully in the life of our neighbors and our fellow students. For almost two years our only contacts with Americans were at church.

We found the Brazilians to be a delightful people. They were very considerate and thoughtful neighbors. They were friendly and curious about the United States. They were very dependable. We came to realize that you find exactly what you are looking for in a foreign country. It is not the foreign country but the attitudes of the Americans that are most important. They determine what the reactions of the Americans toward their foreign societies will be.

History and geography have been very kind to the United States. Our mountains are intersected with passes that provide easy access to the other side. Our rivers flow the precise way that they should to permit entrance to the interior of the nation. We have large extensions of fertile land blessed with an excellent climate. Our minerals are located just where they should be in terms of cheap production of metals. We have large quantities of mineral fuel.

We have never had to concern ourselves about hostile nations on our frontiers. Canada has usually been rather friendly. Mexico has sulked within her borders aching from the American amputation of one-half of her territory, but she has never posed a military threat. Broad oceans have separated us from potential enemies. We could, therefore, relax in the exploitation of a wealthy continent. We never had to concern ourselves seriously about the activities of other nations until the twentieth century.

All of this has completely changed. Today we are engaged in a bitter and ambiguous struggle on every continent in the world against the doctrines and forces of Communism. In the past few years, our military forces have been engaged in battle in a number of different countries. The attitudes and reactions of other countries have suddenly become of great importance to us. We can no longer afford to neglect the currents of international opinion.

Isolation and Misunderstanding. Unfortunately, anti-Americanism is growing in many parts of the world. I have never seen anti-Americanism as strong in Latin America as it is today. This situation is ironic as our international intentions are highly moral. We want no increase in territory. We are not planning to attack anyone who does not attack us first. We want no special trading privileges or payment of tribute. We would like all nations to be independent and to flourish. We spend millions of dollars in foreign aid. We should like to see such ideologies as Communism that threaten individual or national liberties destroyed. Why don't other nations realize this? Why are they so suspicious of us? Why can't we translate our good intentions into words and concepts that are understood and accepted in every part of the world?

The basic reason for our failure is our own cultural and intellectual isolation. It is a failure based upon our own ignorance of the languages, histories, and cultures of other peoples. It is a failure in communication created by our apparent inability to break through our own cultural blinders and to comprehend the attitudes, values, beliefs, hopes, and aspirations of the great masses of mankind. It is a failure that stems from the basic inability to realize that not everyone wants the same things that we do, not everyone wants to be like us, and not everyone admires our culture or way of life.

Minority groups, cultural pluralists argue, could play an important role in breaking down the barriers of communication between the United States and the countries from whence the immigrants came. Members of minority groups who have preserved their native languages and cultures and yet who speak English and understand Anglo-American cultural values could serve as bridges of cultural understanding. Bilingualism and biculturalism could serve the needs of the United States to communicate with other peoples. A linguistic and cultural minority group should thus be encouraged and assisted to preserve their own language and culture. Their minorities should be regarded as a precious natural resource to be encouraged and maintained rather than warred against by our national cultural institutions.

Socialization and the School. The American school system has been the major vehicle for the Americanization of the immigrant children in the United States. Although in this discussion a severe criticism will be made of the public school system, it must be recognized in all fairness that the public schools opened the doors of opportunity for many immigrant children. It taught them English, prepared them for college, gave them at least a superficial knowledge of Anglo-American culture, and equipped many of them with tools to move upward from poverty and the urban slums into the middle class. The argument of cultural pluralists is that if the public school had made some concessions to the languages and cultures of immigrant and minority group children, it could have done all that the schools did do without inflicting serious psychological and cultural wounds upon immigrant students.

For every minority or immigrant child who made it with the help of the school, there were large numbers who failed because of the social and cultural characteristics of the school system. The majority of teachers in the public schools possess a middle-class background and are imbued with Anglo-American middle-class values. They have little knowledge of the languages or culture of their minority group students. They

are usually ignorant of the impact of hunger and of poverty upon child behavior or learning ability. They are virtually ignorant of the economic, social, and cultural backgrounds of their lower class or minority students. The school curriculum is oriented toward college or toward teaching low paid semi-skilled occupations. The teaching materials are frequently unrelated to the child's environmental world. All teaching is done in English, and school children are punished if they speak their native languages during school hours.

The impact of the present school system upon the Spanish-speaking children of the Southwest is disastrous. Drop-out rates may rise to over ninety per cent. The children caught in a linguistic trap may fall from three to four grades behind English-speaking students. The majority of the Spanish-speaking school children never acquire a basic knowledge of the English language and are prevented by the schools from developing an effective command of their own Spanish. They are functionally illiterate in two languages.

The problems of functional illiteracy could be avoided and the high drop-out rate diminished if Spanish were used as a major teaching language in the early elementary grades. The school systems of many countries with large linguistic minorities have shifted to the use of the local language in the elementary grades. Thus, in North Wales the elementary school teaches in Welch. In Mexico, the Indian languages are utilized. The Russian school systems also teach in the native languages.

There is no rational reason why Spanish-speaking and Indian children should not be taught in the lower elementary grades by specially prepared teachers in their own languages. Such a procedure would accelerate learning and prevent bilingual students from falling behind English-speaking students. During this period, English would be taught by all the most modern techniques as a second language. As the children moved up through the school systems, English would be emphasized more and more. The goal of the school system would be to turn out children who are able to speak, read, and write both Spanish and English.

The linguistic problem is a most serious one because it affects not only the learning ability of the students but also their self image, their attitudes toward their families, their own minority grouping, and toward the larger society. Many students, unable to overcome the linguistic handicap, drop out of school. In urban slum areas they are apt to become involved in anti-social behavior. In rural areas, they never acquire the basic educational skills needed to function in our complex economic system. As large numbers of these drop outs move to the larger urban centers in Arizona, Colorado, California, and Utah, the problem is not confined only to the sections where these students attend school.

Other students rebelling against the poverty, the low socio-economic level of their parents, and the difficulties they had in learning English generate considerable self and group hatred. They identify themselves with the dominant group and go to great lengths to perfect their English. They deliberately imitate Anglo-American behavior in all aspects of their lives. As their imitation is apt to be somewhat superficial, they are never quite at home in their new roles. They tend to acquire Anglo attitudes toward their own people, and to be forever concerned about the nature and quality of their acceptance by Anglo-Americans. This self and group hatred does considerable psychological damage to Spanish-speaking students and could be prevented by a school system more in adjustment to the characteristics and needs of the Spanish-speaking people.

The training and preparation of teachers is another major aspect of the school system of the Southwest that is in dire need of revision. No teacher should ever be assigned to teach Spanish-American or Indian children who has not received a thorough preparation into their cultural values, the socio-economic background of the children, the impact of poverty and hunger upon the performance of school children, the linguistic problems of bilingual children, and the nature of the acculturative process. Preferably they should have some knowledge of the native language of their students. English teachers should be trained to teach English as a second language.

The importance of the selection process of teachers is underlined by the fact that the school teachers are often the only Anglo-Americans with whom the students will ever have intimate contact. Their concepts of Anglo-American life and behavior are acquired by observing the teacher and from movies and television. Teachers who are poorly prepared, who are prejudiced, who are apathetic, or who lack the ability to establish rapport with minority group children, sow the seeds of prejudice and misconception. An emotional and cultural screening of teachers is needed as well as an intellectual and cultural training.

The question of educational materials is a serious one for Indian and for Spanish-speaking children. The readers and manuals in the early grades have no meaning for them. The principal characters in these reading materials are nice middle-class blond Anglo-American children living in the suburbs and playing with dogs and kittens. What relevance do these readers have for Indian or Spanish-speaking children living in isolated rural villages or in the urban slums? There is literally no one in most of the reading material utilized in Southwestern school systems with whom the children of either group can identify, understand, or imitate. These books and manuals indirectly foster feelings of personal and group inferiority.

The materials used to teach state and regional history in areas such as Texas are even more harmful. The official Texan and Anglo-American history texts present the Indian and the Spanish-speaking groups as inferior, blood thirsty, backward, and cruel. The Indians and the Spanish-speaking groups lost in the conflict for the Southwest. The Anglo-American winners portray the losers in very unflattering terms. How does a

Mexican-American child react to the official teaching of the events of the Alamo? What does an Indian child think about the heroic Anglo pioneers resisting cruel Indian attacks? Even in college the student of Mexican origin will read such biased materials as Webb's book on the great plains. There is a very drastic need to carefully revise all teaching materials used in the Southwestern schools to eliminate all prejudiced, discriminatory, and stereotyped materials on the major minority groups of the area.

Teachers and school administrators tend to cast the blame for the poor performance of their students on the children and their parents. One hears very often that the school ought to take minority children away from their parents at a very early age. Here there are echoes of the days when the American military kidnapped Indian children to place them in boarding schools where presumably they were civilized. Teachers and school administrators never ask themselves the question whether or not the school curriculum ought not to be radically revised to eliminate the cold war between the school and minority group languages and cultures.

The question of hunger is also acute in the Southwest. There are large numbers of Indian and Spanish-speaking children who literally do not get enough to eat. These children in the schools tend to fall asleep. Others daydream or become apathetic. Still others react by hyper-activity and become troublemakers. No one in the public school system has ever asked what a good free breakfast might do to improve the learning performance of these children. One dental survey in the town of Canutillo, Texas, just outside of El Paso, revealed that the majority of school children examined were suffering from evident signs of malnutrition.

Free Public Education. Education in the public schools of the Southwest is not free for the poor. Children are constantly coming home with notes requesting money for school supplies, yearbooks, athletic and cultural events, laboratory and library fees, and even for diplomas. Their parents are also requested to donate money to the school and to the P.T.A. activities. The amounts asked are not excessive to a middle-class family, but they are a heavy burden to a poor Spanish-speaking family perhaps living on from $500 to $2,000 annual income. I personally know many Mexican-American students from poor homes in the slums of El Paso who have dropped out of school because of their inability to pay the school fees. One boy quit school just before graduation as he could not afford to rent an academic gown or to pay for his diploma.

Many school administrators will answer that there is money available through the schools or through civic clubs to assist poor students. Unfortunately, this assistance is either given in such a manner that the identity of the recipients becomes known to all the students or in a way that is humiliating to the Spanish-speaking student. These children have a very strong sense of pride. They will leave school before they have to ask for financial assistance. The majority of school personnel have seldom learned to sense need and to give graciously and privately.

The schools also cause considerable juvenile delinquency. In El Paso many Mexican-American students are suspended from school for some reason and sent home with a note stating that the student will not be allowed to return to school until his parents come for a conference with school authorities. This is a workable procedure for middle-class families where the mother may not work or where one parent can get away for a few moments from his employment without any difficulty. In poor homes it is unworkable.

The Mexican-American student in El Paso will not usually tell his father. He is afraid of being punished for having brought shame on the family name. He knows that his father would find it difficult to take a day off from his job. Furthermore, the family can not afford to lose the day's income. The same reasons apply if his mother is working. Therefore, the boy frequently will not tell either of his parents. In the morning he leaves his home for the street.

After several weeks have gone by, the school administrators refer the matter to the juvenile court. A police officer comes to the home with a court summons. The parents, angry and indignant, then must take off a day and accompany the boy to court. There the parents and the boy may be threatened, humiliated, and fined. In some cases, the boy may be sent to the detention home or the industrial school.

Other boys drop out of school or play truant to sell newspapers or to shine shoes. They are constantly on the run from the police. Many slum children have never gone to school. They have never been registered with the school. Many immigrant children are also unregistered. The urban slums of El Paso are filled with boys and girls who should be in school and are not. These children are constantly on the run from the juvenile patrol, the police, and the school authorities.

The majority of the boys in the South El Paso tenements begin working at a very early age -- some around five or six years. They start as shoeshine boys, truant from school, running in and out of the bars and cafes of downtown El Paso, half beggars and half shoeshine boys. Their shine kits are homemade. The older boys teach them the art of shining shoes. If the young boys are molested, they return to their neighborhoods to seek the protection of the older boys. As the younger boys grow older, they graduate to selling newspapers.

Barefooted and ragged they are exposed to harassment by the police. They very early become familiar with all types of anti-social behavior. At night, escaping from overcrowded hot tenement apartments, they sleep in the alleys, or tenement roofs, or darkened doorways. The very few dollars that they earn a week will be used to buy their own food and clothing. Most of it will be given to their mothers. They are extremely loyal to their own families and to their own neighborhoods.

Now to dwell for a moment on the self-image of the Spanish-speaking children and their parents. Self-respect and pride in one's family, one's ancestry, and one's national or ethnic group are vital for the development of self-confidence. The majority of Spanish-speaking children never develop that kind of pride and confidence. The only Anglo-American that they see are the well-dressed, well-fed, and authoritarian school teachers, principals, social workers, and police officers. These Anglos tend to communicate to the children subtle feelings of individual and of group superiority. The children very seldom have any contact with poor Anglo-Americans.

These children seldom see a well-dressed Spanish-speaking person occupying a position of political, economic, or social importance. The majority of their parents and neighbors are unskilled or semi-skilled workers earning an inadequate subsistence salary. The suburban neighborhoods they may see are inhabited by Anglos. Their own neighborhoods are filled with tenements and tiny toy-like houses. They are familiar with the day to day poverty, apathy, despair, and anti-social behavior of their own neighborhoods. As far as they know, such conditions never exist among Anglo-Americans. Even when they come in contact with a well-dressed Spanish-speaking adult, he is apt to be occupying a subservient position under an Anglo-American.

The Male Role. Furthermore, what happens to the esteem or self-respect of a man who can never earn enough to properly take care of his wife or his children? If he is Spanish-speaking, he is apt to lose his self-respect because he can not live up to the traditional Mexican concept of a "macho," a man who can solve his problems, who can support his family, who can maintain his dignity and his honor. The Mexican-American or Spanish-speaking male is even harder hit than the Negro male under such conditions because there exists in his culture a strongly-defined masculine image. Unable to function as a male should in his own cultural definition of masculine behavior, the Mexican-American or Spanish-speaking male is apt to desert, to drink, to find escape in sexual affairs, or to become brutal to his wife and children.

The Spanish-speaking mother traditionally is subservient to her husband. She should be quiet, obedient, and confine her activities to her home and children. Inevitably, she is forced into the job market, if her husband cannot support his family. Knowing that her husband is failing in his duty, she begins to lose respect for him in the home and to challenge his authority. The children also find it difficult to honor, obey, or respect a father who cannot meet their financial needs.

The environmental problems of slum children are compounded among the Spanish-speaking children by culture and linguistic conflicts. The children early become aware that their parents either cannot speak English or speak it very poorly. They know that their fathers are often occupational and financial failures. They realize that their mothers feel futile and hopeless before the problems of slum existence. The result is that a serious generational and cultural conflict comes into existence.

Many children become deeply ashamed of their parents. They are bitter because their parents cannot feed, clothe, and house them adequately. They rebel against overcrowded tenements, hunger, malnutrition, and lack of spending money. They also rebel against the Anglo-American culture as expressed by the school teacher, the rent collector, the social worker, and the police officer. They know that their parents are exploited. They know that the majority of tenement owners are Anglo-American. They know that they do not receive equal justice in the courts. They develop deeply-rooted feelings of bitterness, hostility, and frustration directed both against their own minority group and against the dominant Anglo-American society.

Because these children cannot find adequate release for their tension or satisfaction for their needs, they turn from the home and the school to the street. It is useless to tell the children to keep off the streets as Anglo-American police and teachers frequently do. From Denver, Colorado, on the north, to the Cape of Good Hope at the end of South America, the street corner is the club of the poor neighborhood. Here children will congregate and play until late in the afternoon. As they leave, their place will be taken by teenagers coming together to talk endlessly, play guitars, sing, and watch life go by. To an Anglo-American, a group of teenagers on the street corner is a dangerous group usually engaged in mischief. To the Spanish-speaking people, the street corner is the natural and logical place to meet. There is probably more hostility generated by the habit that the police have of running children and teenagers away from their neighborhood street corners than by almost any other factor.

Conclusion. Returning from the Spanish-speaking people to the general theme of cultural pluralism, I would like to point out that the majority of the larger immigrant and ethnic groups in the United States have not melted nor blended into the general population. They have shown an amazing ability to persist in American life beyond the third or fourth generation. These immigrant groups such as the Italian-Americans, the German-Americans, the Polish-Americans, and the Mexican-Americans have acquired the externals of American culture. They speak English. Their children attend the public schools. They participate in American life, but they have not lost their basic cultural values. They have preserved their ethnic identities.

In summarizing this presentation on cultural pluralism, it should be pointed out that cultural pluralists argue that the acceptance of cultural pluralism by Americans would diminish the amount of racial, cultural, and linguistic conflicts among us. It would reduce personal disorganization among members of minority groups and smooth the path of their adjustment to American society. It would diminish social disorganization as reflected by alienation, family breakdown, apathy, and feelings of hopelessness and powerlessness among minority group members. The retention by immigrant and ethnic minorities of their basic cultural values

and institutions will strengthen their sense of personal and group worth. It would help minority members to maintain their personal dignity and prevent the development of devastating feelings of personal and of group inferiority and inadequacy.

Cultural pluralism would also blur and weaken the tendency of our society to stratify into a more rigid class system upon social and economic differentiation. As membership in ethnic and minority associations tend to cross class lines, these lines are thereby softened and diffused. The members of an ethnic group may tend to feel that they have more in common with each other than they do with other people in their same social class levels. Cultural pluralism thus has as a major hypothesis the idea that if the American culture were diversified by the existence of strong regional sub-cultures and the active encouragement of minority and ethnic group cultures, a far richer national culture might come into existence.

And finally cultural pluralists are working toward the development of a cultural democracy, a cosmopolitan society open to all the cultural winds that blow from any part of the world. It is our fundamental conviction that out of the adoption of cultural pluralism as a philosophy of social action, there will grow a richer and more mature America in which the basic cultural, social, and economic needs of all her inhabitants can be more fully met.

SPANISH SURNAMED PEOPLE OF THE SOUTHWEST

My second presentation will be devoted to a discussion of the basic institutions and values of the Spanish-speaking people of northern New Mexico and southern Colorado. It should be remembered that there are substantial differences in history, racial composition, dialect of Spanish, rural-urban residence, and degree of involvement with Anglo-American culture among the Spanish-speaking people of the Southwest.

What Should they Be Called? A serious problem facing students of the Spanish-speaking groups in this area is the problem of terminology. An accurate terminology acceptable both to the people described and to scholars in the field has not yet been developed. Before World War II, all Spanish-speaking people were called Mexicans and all English-speaking people Americans. Because of the unfortunate connotations that gathered around the word, Mexican, as used by the Anglo-Americans, the term became rather offensive to the Spanish-speaking people. In intimate conversations among themselves, they will use the term Mexican, but Anglos should never use it in northern New Mexico and southern Colorado as it would be regarded as insulting. Elsewhere it can be used, but only after some discrete questioning.

The term Spanish-American came into being in New Mexico and Colorado around World War I. It is acceptable to the people of this area. It can be used without fear of giving offense except among the more anglicized Spanish-Americans who bristle at any tag. Among some scholarly circles, especially in Colorado, the word Hispano may be used to define the Spanish-Americans. The term has not won any wide acceptance. Among some circles in Texas, Anglo-Americans may call the wealthier and more anglicized Spanish-speaking or Mexican-origin families Spanish-Americans to differentiate them from the masses who will be titled Mexicans.

In Los Angeles the word Mexican-American is gaining wider usage among the professional and business groupings of Spanish-speaking people. The use of this term is spreading along the border in California, Arizona, and Texas. Latin-American as a name has gained some ground in and around El Paso and the lower Rio Grande Valley. Its use is limited to the border. Probably Mexican-Americans will tend to replace other classificatory terms used in the future.

To a significant degree the widening use of the word Mexican-American reflects the growing pride of the Spanish-speaking people of Mexican origin in the enormous progress that Mexico has made since the Mexican revolution. A whole new generation of middle-class Mexicans has come into existence. This Mexican -- a lawyer, a doctor, a businessman, a government employee, an industrial manager, a rancher, or a scientist -- has an enormous pride in his Mexican nationality. This pride is beginning to spread north of the border.

A tortilla curtain isolated the United States from Mexico. This tortilla curtain is composed of American ignorance about Mexico. Most Americans associate Mexico with the curio shops, the houses of prostitution, and the bars of the Mexican border cities. They are not aware that a new dynamic Mexico has come into being. They do not know that many Mexican writers have been translated into many languages and are considered to be among the better writers of the world. They are not aware that Mexico has developed a major school of art. They fail to know that Mexican industrial products are now being shipped to many parts of the world, including the United States. They have never read that many Mexican architects and engineers are working on projects in the United States and elsewhere. Americans, indeed, are almost unprepared to deal with Mexican or Latin American realities because of their almost total ignorance of everything south of the border.

The Spanish-speaking people of northern New Mexico and southern Colorado came into the Southwest in the sixteenth or early seventeenth centuries. As population increased, they spread up and down the Rio Grande living in small rural farming villages. As time went on their villages began to dot all the mountains of northern New Mexico and southern Colorado and to spread along the streams and rivers flowing from the mountains.

The Village. The Spanish-Americans settled in rural farm villages located on land grants secured from the Spanish and Mexican governments. The average village consisted of a cluster of individually-owned adobe houses built around a central plaza. Each village, until very recently, was a small isolated self-sufficient autonomous social cell. Isolated formerly by Indian raids and, until very recently, by impassable roads, the inhabitants of a village were forced to rely upon their own cultural and economic resources.

The village economy was built around a subsistence agriculture based upon the farming of small strips of irrigated farm land and the grazing of livestock upon the communal grazing lands of the land grant. There was some trading with the Indians and barter with merchants and peddlers that moved through the area. The village people made their own tools and household furnishings. Except for iron and salt, each village was virtually self-sufficient as long as the Spanish-Americans retained their land.

The Spanish-American village economy managed to struggle along until the depression and the drought of the 1930's brought it to an end. The system was destroyed through the erosion of its land base. From the 1880's to about 1910, the Spanish-Americans lost virtually all of their grazing land to the Anglos. They were caught like flies in a spider web of Anglo-American legal and economic practices that stripped them of their land. Every method ranging from force and violence through legal entrapment to manipulation of the land

tax was used by Anglo-Americans to confiscate Spanish-American land. The loss of their grazing land, erosion, drought, archaic farming methods, and a rapidly increasing population forced more and more Spanish-Americans into the migrant labor stream.

Another destructive economic force in the Spanish-American village was the shifting of the local village economy from a subsistence agricultural, local handicrafts, and barter basis to a credit economy. Anglo-American merchants gradually opened retail and wholesale stores in the villages. They encouraged the villagers to open accounts with them. Dealing with an illiterate population and keeping the books, the merchants alone knew what the state of the accounts were. When crops and livestock were ready to market, the surplus was sold to the merchant at a price set by him. The villager knew nothing of price fluctuations, of depression, of prosperity, or of the law of supply and demand. The merchant set the retail price of the goods that he sold, the price of the agricultural products that he bought, and the interest rate of his accounts. He usually built up large landholdings by foreclosing on the lands and homes of villagers unable to pay up their accounts when they were called in at the convenience of the merchant.

The depression of the 1930's ended the demand for migrant labor. The drought destroyed crops for several years. The village populations were rescued from near starvation only by massive government aid programs. The psychological results were quite destructive. Large numbers of Spanish-Americans lost faith in their ability to meet their needs in a traditional fashion. Sinking into apathy and cultural shock, they fell back upon welfare as a way of life. Reluctantly and bitterly, thousands of others began to move from the villages toward the city.

The Village and the Family. The social structure or community organization of the village was a simple one. Each village was inhabited by a number of very large patriarchal families. The family consisted of three or four generations living in the same residence or section of the village. Some of the smaller villages were inhabited by members of a single large patriarchal family. The family was composed of the grandfather, the family patriarch, his wife, their married sons and their wives and children. The family worked and cooperated under the direction of the grandfather as a single economic, social, and cultural unit. The grandfather represented the family in its relationships with village, county, and state authorities, and with other village families. He decided how the family as a unit would vote. Every politician in New Mexico and southern Colorado was very much aware of the size of the extended Spanish-American family, the number of votes each could control, and the favors that had to be given to secure this vote. Every government official in applying the law to members of a large, powerful family had to consult with the family heads first. These powerful families were usually not interfered with unless they systematically violated the law. The importance of the family among the Spanish-Americans was enhanced by the fact that it carried on most of the functions of welfare, education, social control, religion, recreation, politics, and production and consumption of goods and services. It was the very foundation of Spanish-American life.

The compadrazgo or godfather system was used to strengthen bonds between related families and between the family heads and more powerful individuals in the village. Parents often asked relatives to sponsor their children at baptism and confirmation. Friendly neighboring families were also asked. A favorite choice would be a powerful political or economic figure. The sponsors of such religious ceremonies assumed special ceremonial obligations to the sponsored children. The compadrazgo system frequently united an entire village in a network of kinship and ceremonial obligations.

Within the family the male members had more authority than did the women and younger family members who were expected to obey the older members of the family. The wife was expected to be submissive, obedient, and long suffering. A good wife seldom left her home except in the company of her family. Her husband was free to come and go as he pleased. The wife, although subordinant, was not subjugated. Obedient and tolerant toward her husband, she was loved by her children who respected her. At times they feared their fathers, and in many Spanish-American homes the mother and children were united in a tacit conspiracy to conceal family matters from the father.

Brothers were expected to protect their sisters as long as either lived. A woman seriously oppressed by her husband could expect assistance from her brothers. Children were taught to be courteous, obedient, and respectful to all older persons and to their older brothers and sisters. Conflict between members of the family was rigorously repressed. All cousins were treated as brothers and sisters and uncles and aunts as one's own father and mother.

In terms of authority within the family, the grandfather was the absolute authority. He regulated the labor of his family members no matter how old they were. His decisions were seldom disputed by other family members. His wife had authority over the operation of the household and the rearing of the children, but was expected to consult with her husband over any major problems of family behavior or decisions. The daughters-in-law were expected to assist the grandmother and to be considerate of her desires.

The younger children were reared and disciplined by their mother. The boys upon reaching puberty were defined as men, and their care and discipline then passed into the hands of the father. The mother could

advise and counsel with her sons, but they were seldom controlled by her wishes after puberty when they began to associate and work closely with their father. The older girls remained in the home under the authority and jurisdiction of the mother. If the father were to die, the oldest son became the head of the family. Brothers were expected to cooperate closely and to assist each other any way that they could.

The structure of the Spanish-American family enshrined in tradition and religion and protected by physical and cultural isolation was seriously weakened by the destruction of the subsistence village agricultural economy. At the present time Spanish-American families are spread out along a continuum. At the one end are the more traditional Spanish-American patriarchal families found in the more isolated villages and here and there in urban slums. At the other end are found disorganized urban families marked by high rates of juvenile delinquency, husband desertion, poverty, illegitimacy, and apathy. There is no longer a single Spanish-American family system.

Although migration has scattered members of Spanish-American families throughout the West, strong efforts are still made to maintain strong and intimate kinship relations. Visits are frequently made to parents, grandparents, brothers, sisters, and even cousins, uncles, and aunts. Family members encountering unemployment and financial problems can count upon the assistance of family members. Orphaned children are still taken in and widows assisted. The family still plays an important role in social control and in meeting the needs, wherever possible, of family members.

One of the most important factors in the adjustment of lower-class Spanish-American families in cities such as Denver, Pueblo, or Colorado Springs is the employability of the husband. If he can find a job with a salary adequate for family needs, the family may well adjust to the new urban environment with a minimum of social disorganization. If he cannot, the burden of supporting the family may fall upon the wife. The impact upon the husband is shattering. He finds that he cannot function as the traditional Spanish-American husband should. He cannot support his family. He can no longer serve as the traditional head, making the basic decisions and representing the family in its relationships with the outside world. The wife inevitably will, when she becomes the major support of the family, question the husband's authority. She loses respect for him. The husband then may react by deserting his family. He may find release in alcohol, drugs, or sexual promiscuity to salvage his dwindling self-respect. The deserted wife may either seek the protection of her relatives or struggle along as best she can. The fact that in urban areas a Spanish-American wife may be able to find employment more readily than her husband has had a profoundly destructive effect upon the family.

Another important factor of the urban evolution of the Spanish-American family is the ability of the parents to satisfy their children's economic needs. If they are able to feed, house, and clothe their children adequately, the children seldom become involved in anti-social behavior. If they cannot, many children will struggle to assist their families by any way that they can, including stealing, dropping out of school to shine shoes, sell newspapers, or find any type of work they can. The loyalty of these children to their families is remarkable. Other children will become frustrated, bitter, and resentful. They may rebel both against the culture of their parents and the culture of the dominant Anglo-Americans. Unable to satisfy their needs in their homes or in public institutions such as the schools, they will turn to the street and to their peer groups for needed satisfaction. Parents who cannot provide for their children have few efficient disciplining techniques.

Spanish-American parents also regard boys who have reached puberty as young men who have their own lives to live. In the villages these boys were under the close supervision of their fathers, older brothers, and uncles. In the streets of Denver or Pueblo, they have very little contact with any adult Spanish-American male. The girls, living closer to their mothers, are more protected against anti-social behavior.

The Patron. The leadership of the Spanish-American villages was exercised by patrons. A patron was and is a prominent person, usually wealthy, and of powerful family ties, who is able to provide economic security, leadership, decision-making, and problem-solving to those who are dependent upon him. His position as a patron is not based upon his personal characteristics but rather upon his ability to perform the defined role of a patron. Two basic kinds of patron came into existence in New Mexico. One was the powerful landholder. This type developed primarily in the ranching areas of southern Colorado and northern New Mexico. The large landowning patron developed a relationship with his peons and their families that resembled in many ways a feudal system. He was responsible for the employment of his workers. He took care of them when they were sick, disabled, or aged. He maintained the orphans and widows, resolved conflicts, directed communal labor efforts, and provided military and political leadership. He was expected to be a hospitable, kind, patriarchal father to his people. In return he received absolute obedience. The relationship between the worker and the patron rested upon a set of traditionally defined roles. The worker was tied to the large estate by debt peonage until fairly late in New Mexican history.

The second and more common type of patron found in every part of New Mexico and southern Colorado was the village patron. The village patron was an individual respected by his fellow villagers for his wealth, his political influence, the size of his extended family, his ability to employ members of the village, and for his wisdom and knowledge. His position as patron rested upon the willingness of the village family heads to accept him as patron. They supported him as long as he did not interfere in personal or family affairs, use his position to abuse fellow members, violate basic village moral codes, or become unable to carry on the role of the village patron.

As patron he represented the village in its relationships with other villages and with higher political authorities. He settled disputes between village families, provided employment, assisted the poor and helpless, called out village men for communal labor, and maintained the church or school. It was expected that he would use his position to improve his economic and political influence. This was acceptable as long as village families received a share. The patron was the father figure for the village. The same obedience that sons gave their fathers was granted by the fathers to the patron, providing that the patron looked after the interests of the family. In turn, the village patron was dependent upon a regional patron who was generally the head of a powerful regional family that owned extensive lands, businesses, or held important political or financial position. The power of each patron depended upon his ability to do favors and command the support of those under him.

The regional patron was for sale. The state politician who was able to provide him with money, increase his prestige, enlarge his landholdings secured the support of the regional patron during elections. If one state politician was able to bid higher for the support of the regional patron, the patron was capable of switching political support to him just before an election and abandoning his former state patron.

Under constant Anglo-American economic and social pressure, the Spanish-American land-owning patron group rapidly weakened and then disintegrated in the second decade of the twentieth century. Stripped of their land and wealth, they vanished as an important social and economic group in New Mexico and Colorado. Their disappearance removed the entire upper class stratum of the Spanish-American class system in most rural areas. Their going removed a protecting buffer from the Spanish-American villagers and exposed them to the full force of the social and economic change.

Politics was the only area in which the Spanish-Americans were able to maintain a position of importance. Anglo-American politicians had to court the Spanish-American vote, and some patrons became "jefe politicos." The jefe politico or political boss was a political broker. He sold the votes of the people he controlled to state politicians for whatever price he could get. His power rested upon his ability to deliver substantial blocks of votes to an Anglo political clique. In return he was allowed to control all public employment in his county from school teaching to federal appointments. As sheriff he could use his power to intimidate the opposition, to arrest or release persons just before an election, to serve or not serve public summons, and to manipulate the county tax rates. County prisioners were fed frequently from a store controlled by his family. All insurance on public and even private property in his county came from insurance companies owned by trusted cousins or other relatives.

The jefe politico is seldom concerned with the more serious political, social, and economic problems of his people. Deeply involved in bread and butter politics, he is for sale to the state politician who is able to pay his price. He is still the major Spanish-American political leader -- a pale shadow of the old patron. In areas where he has disappeared, his disappearance has led to factionalism, apathy, and dependence upon government welfare social agencies. Many Anglo-Americans criticize the jefe politico for his short-sighted leadership, his corruption, his lack of a political morality or ideology, his exploitation of his people, and his willingness to sell out to the highest buyer. They have not yet faced up to the problems of developing alternative systems of leadership that will function within the cultural value system of the Spanish-Americans. The traditional patterns of decision-making, conflict solution, caring for the poor and handicapped, financing of village affairs, organization of communal labor, and maintenance of ethnic and village identity have disappeared.

Leadership and Value Systems. The patron and jefe politico systems rested upon values and attitudes of the Spanish-Americans toward political leaders, government agencies, welfare, employment, and leadership. Among these attitudes are: (1) a blind loyalty toward traditional ethnic leaders; (2) a tendency to want to enter into a secure position of dependency upon an employer or political leader; (3) a reluctance to make decisions; (4) a dislike of competition and personal initiative; (5) a preference for a stable personal relationship in which everything is well defined; (6) a distaste of the formal impersonal relationships of the Anglo world; and (7) a strong resistance to social and cultural change. These attitudes strongly handicap the adjustment of the Spanish-American to the competitive, impersonal, urbanized, industrialized life into which the Spanish-Americans are moving. Any Anglo social worker or other professional working with the Spanish-Americans must have some understanding of these basic values in order to comprehend the behavior of the people with whom he is working.

The social and economic costs of the destruction of the native Spanish-American economy and social structure have been extremely heavy in the Southwest. A large distressed region marked by poverty, functional illiteracy, unemployment, high rates of welfare payments, poor educational facilities, emigration, apathy, and ethnic bitterness has come into existence. As the Spanish-Americans have migrated into Denver and other urban centers, they have taken their problems with them, and in the urban environments these problems are more difficult to solve than they would be in the rural villages from whence they came.

Millions of dollars have been spent fruitlessly by Anglo-American planners because of their lack of understanding of the basic problems of the Spanish-Americans. The greatest obstacle to a successful solution of some of these programs is the tendency by the Anglo-American administrator to assume that his goals, values, and attitudes are shared by the Spanish-Americans and the Indians. Until program implementers are willing to develop programs within the cultural framework of the Spanish-Americans and American Indians, their programs will continue to have little impact.

The Language Barrier. One of the major cultural barriers in the rural areas of the Southwest is that of language. Many English-speaking Americans resent the fact that some American citizens of Indian and Spanish-speaking backgrounds persist in using their own languages. This is regarded as disloyalty. Spanish-Americans have been fired for speaking Spanish in an office or factory. Few attemtps are made to cross the linguistic barrier by Anglos. Government programs tend to be written in English and the agents touring the villages explain the programs in English. This is often interpreted as a deliberate insult by the Spanish-Americans and Indians. Furthermore, when programs are translated into Spanish, they are translated into the academic Castillian Spanish which may be as far removed from the oral Spanish of the local people as it is from English.

Bureaucratic Static. Anglo-American professionals seldom really talk to the Spanish-Americans. They talk above them. Educated in colleges and universities and often with considerable experience in their agencies, these professionals tend to discuss programs and cases from a rational Anglo-American point of view. If a plan can be drawn up that rationally fits all the factors involved, it should work. One but needs to sell it to the natives. However, the natives may well have their own ideas about what their problems are and how they can be solved. The Anglo-Americans seldom believe that poor semi-literate non-English-speaking villagers or urban slum residents may have ideas about their own problems and may have thought out solutions that have value.

Still another failure on the part of the Anglo-American agency personnel is their inability to know who the real leaders of the Spanish-American people are. They assume that the richest, most successful, best educated, and most literate in English are the leaders. They also assume that the anglicized Spanish-American who works for a governmental agency will be accepted as a leader. They universally fail to realize that precisely because these men have become anglicized and have risen far above the level of the masses, they will never be leaders. They fail to realize that the real leaders in the villages and slums are men who still preserve Spanish-American values and who live in the same environment that the people live. One does not know whether to cry or weep at some of the terribly funny yet tragic attempts of Anglo-Americans to discover who the Spanish-American leaders are and at the way they are conned by enterprising Spanish-Americans who persuade the Anglos that they are leaders.

Furthermore, the Anglo planner is an impatient man. He wants definite decisions and commitments. He wants public meetings with democratic discussions leading to a majority vote. He is baffled when he finds that the Spanish-American does not accept his process. The Spanish-American prefers a series of private conversations with his friends. He does not want to antagonize people by openly attacking their views or ideas. He relies on a process of slowly coming to a consensus in which all of the people concerned accept the proposals. He dislikes the idea of having to state his ideas in public.

Now to translate the problem of conflict in values into personal factors. All over Latin America the street corner is the poor teenager's club. As evening comes groups of teenagers will be found sitting and lounging on street corners in the Spanish-American sections of the Southwest. To the Anglo-American policeman and social worker, groups of teenagers on street corners spell delinquency and trouble. Therefore, the police officer will stop and search the boys. He will tell them to go home. The Spanish-American or Mexican-American boy will believe that he and his friends are being deliberately harrassed by the police.

Personalism. An important Spanish-American value is personalism. According to this value every person has an innate dignity as a human being and, therefore, should be treated as an individual rather than as an impersonal employee, client, case, or student. Every Spanish-American, no matter how poor, has his personal dignity and honor. This creates conflicts and problems. For example, an Anglo employer comes into an office in the morning and says nothing when addressed by his employees. The Anglo employee will believe that the boss has had trouble with his wife or is suffering from indigestion and thinks nothing about it. The Spanish-American employee will believe that his boss is hostile to him and does not like him. The chances are that the Spanish-American will not return to work the next day. Many Anglo-American women who employ Spanish-American maids could prevent considerable difficulty in their relationship with the maid if they were to realize that she is a human being first and a maid second.

Many social workers when a Spanish-American comes into their office will look up and invite him to sit down. They ask him what they can do for him, and hands the Spanish-American a form to fill out. As he is filling out the form, the social workers goes back to other work. This is interpreted by the Spanish-American as personal prejudice. He feels the social workers does not intend to help him at all. On the other hand, if the Spanish-American comes in and the Anglo stands up, shakes his hand, and escorts him to a chair, the Spanish-American feels that the Anglo is genuinely friendly and trying to help him. If the social worker thoroughly explains the form and helps him to fill it out, the man is very grateful and impressed. Then comes the major test. Anglo-Americans tell white lies because they dislike to hurt a person's feeling or confess that they cannot really help the individual. They say, "Go see this man," or "Come back tomorrow." But if the Anglo picks up the phone in the presence of the Spanish-American and calls an employer or a teacher and discusses the problem, the Spanish-American believes that the Anglo really wants to be of assistance to him.

The Anglo professional should always tell the truth to Spanish-Americans for they have the ability to detect hypocrisy, prejudice, and unwillingness to be of service. We should all remember that a personal intimate relationship or response is the most successful method to use in working with Spanish-American people. Unfortunately, this is difficult for a dignified, impersonal government employee to do. Remember that Spanish-Americans will almost worship their employers, social workers, or teachers if these professionals respect the honor and dignity of their employees or clients.

Spanish-Americans do not like the direct approach. They resent rather strongly a list of questions about their personal and intimate behavior. He would rather forgo employment than answer questions from people he does not know. He is very suspicious and is apt to suspect that the data may be used against him. Therefore, the best approach is to ask indirect questions, proceeding from the harmless to the more intimate. If resistance is sensed, shift to another question. It is possible to secure the data needed through such an indirect line of questioning.

Spanish-Americans and American Indians caught in a situation that is unpleasant or difficult will retreat. The maid who has been scolded does not come back. The student whose feelings are hurt will drop out of school. The employee disappears. If the individual does not retreat physically, he will do so mentally. All communication ceases. He listens woodenly and quietly, but nothing is reaching him.

The Anglo-American professional should learn the basic code of good manners as defined by the Spanish-American and Indian. A person doesn't go into a Spanish-American home without requesting permission from the husband or oldest son. He does not sit down until asked to do so. He should defer to the head of the house and permit him to guide the conversation. He must refrain from direct questioning until the conversation has moved from generalities to the object of the visit. He should not admire individual items in the home, although he may praise the home in general. In very unacculturated homes, he should never admire a child without touching him to avoid an accusation of the evil eye (mal ojo). Among American Indians it is not considered good manners to stare directly at a person. One should be very quiet, slow, deliberate, and look at some object close to the Indian. Anglos believe that anyone who does not look another person straight in the eye is shiftless, sinister, and untrustworthy. Indians define a person who stares another person directly in the eye as impolite, rude, and dangerous. Anglo-Americans in general are thought to lack manners, courteousy, and consideration by both Indians and Spanish-speaking people.

Time. Different concepts over the value of time create endless problems between Anglo-Americans and Spanish-Americans. The Anglo cuts time into definite segments -- a minute, an hour, a day, or a week. He defines times as the past, the present, or the future. To the Spanish-American time is a river. Man is in the eternal present and floats from birth to death without past or future. Why worry about tomorrow? One can't control it, so enjoy each moment of today because who can predict what will happen next.

Materialism. The Anglo-American is far more of a materialist than the Spanish-American. Money, cars, a home, well-dressed wives and children, living in a good neighborhood all have great value to Anglos. They also are valued by the Spanish-American, but he values personal relationships as much or more. One should spend money visiting relatives, having a good time with friends, and lending money to those friends who may need it. Although one is spending his financial capital, he is increasing his social capital.

With the Anglo-American the job always comes first. We are defined socially by our occupations. It comes before our obligations to our families, to our neighborhoods, or to the church. This is not true with the Spanish-Americans. With them the family always comes first. A boy may drop out of school to attend a brother's wedding in a distant city or a girl may quit her employment to visit cousins who have come to town. Spanish-Americans can work very hard. Indeed, there are probably few people who work so hard for so little, but they do not worship work or define it as a positive value in itself. Work is essential to earning a living. Man must work because of the sin of Adam, but leisure also has a positive value. Work should not become the sole function in a human life. A man is born to enjoy his relatives, relax with his friends, and be happy and gay. Life is so uncertain that one should enjoy every minute of it.

Conclusion. Spanish-Americans and Indians are an important social component in the Southwest. The states in this region cannot flourish unless these people can be brought into the economic mainstream of American life. They must share the blessings of our economic system or they will continue to be a burden upon the economic development of the area.

Anglo-American leaders have two choices before them. They can continue to control a social and cultural system that works for the complete anglicization of the Spanish-speaking people and the Indians. If this process continues, large numbers of Indians and Spanish-speaking people will become anglicized and the Southwest will lose most of its color and charm. The area will become no better or worse than many of the neighboring regions such as the Great Plains States. In essence, there will develop a homogenized, mediocre culture. Or our leaders can work for the development of a new Southwest in which the full flowering of Indian and Spanish-speaking cultures and languages will be encouraged. It can become a region of cultural and linguistic pluralism. The cross fertilization of these three important cultural traditions -- the Anglo-American, the American Indian, and the Spanish-American may create a truly creative regional culture that can be richer than the cultures of all the surrounding regions in the United States.

**Judge Ted Rubin**

Judge Rubin became Judge of the Denver Juvenile Court in January, 1965.

He is a member of the Regional Juvenile Delinquency Research Committee of the Western Interstate Commission on Higher Education, and is Director of the research project into glue-sniffing administered by the Juvenile Court under a grant from the Office of Juvenile Delinquency, U. S. Department of Health, Education and Welfare. He is a member of the National Commission on Architectural Barriers to the Physically Handicapped, and formerly served as special adviser to the President's Committee on Juvenile Delinquency and Youth Crime and as a Board Member of Denver's War on Poverty.

Prior to becoming a Juvenile Court Judge, he served as a Member of the Colorado House of Representatives from 1961 through 1964; as a State Representative he was responsible for the development of the Children's Psychiatric Hospital at the Fort Logan Mental Health Center; the State Forestry Camp at Golden Gate State Park, and other legislation related to juvenile delinquency, mental health, and mental retardation.

Judge Rubin was a lawyer in private practice in Denver for seven years before becoming a Judge, and also worked for ten years in the social welfare field as a child welfare worker, psychiatric social worker, and administrative social worker.

He obtained his Bachelor of Arts Degree from Pennsylvania State University in 1948; holds a Master's Degree in Social Service Administration from Western Reserve University at Cleveland (1950); and has a Doctor of Jurisprudence Degree from DePaul University Law School, which he obtained in 1956.

# THE JUDGE AND THE POOR

Ted Rubin

I am interested in you, in what you will be doing from here on, and maybe in some way I can contribute to the breath and depth of your experience.

I would like to give you some background on courts -- more specifically juvenile courts, some of the attitudes you will encounter, and certain attitudes that will be helpful if you can develop them in yourselves, and perhaps some ways that you might operate to increase your effectiveness with the people that you are about to serve. I think a subtitle for my talk should be, "Take Nothing for Granted." What I wish to say is that the courts are not hallowed. Nothing in our society is hallowed, and I think that this is okay. As doctors are having second looks taken at them, psychiatrists are finally being reviewed as to just how effective they are, and as many other facets of our society are undergoing critical review, the courts should be among those at which you look critically. Because all too often, under the guise of justice and protection of the public, they have helped destroy many people. I've seen this happen and, perhaps, I've destroyed a few people too. If so, I regret it.

Let's look historically at juvenile courts and why they grew up, where they have failed, and where they have succeeded. Seventy years ago or so there was a group of nice old ladies in Chicago. You must imagine Chicago shortly before the turn of the century as a haven of many immigrant groups from diverse nations. Some made it and some didn't. The neighborhoods were overcrowded and overrun. But one day the ladies began to ask what happened to the children who got into trouble. They visited the local jail -- Cook County jail. They saw many, many children sitting in the jail doing nothing except talking with adult prisoners and having their attitudes towards themselves and their futures very much influenced by these prisoners. The ladies' first thoughts were that these children weren't getting any schooling, so they began to come in and volunteer to teach them. The more they got into the jails, the more they thought that this was no place for children at all. What we're doing is just piecemeal. So they went to the legislature (the legislature is where we go when we want things done). They had a couple of lawyers draft a bill to establish the first juvenile court in the nation. There is an interesting description by a lady named Mrs. Bowen who was one of the upper-uppers of that day and who lived on the North Shore. She has written how she invited one of the key legislators to her home in suburban Chicago and said to this legislator, "I'm interested in a bill that is sitting down in Springfield, and I'd like to see you get it passed." He asked what it was -- it was the first juvenile court bill. He said, "Just a minute," and excused himself. He made a couple of telephone calls to the two most powerful people in the legislature and a few days later this bill became law. Mrs. Bowen writes that she was rather appalled that legislation could be achieved in such a careless fashion -- that with just a few telephone calls good bills could go through and poor bills could go through with the whim of a few people.

However, this was a terribly important bill and a few years later the Colorado legislature, goaded by Judge Ben Lindsay, enacted a similar law which made Denver the site of the second juvenile court in the nation. In the early years of the juvenile court movement the greatest objectives were used in setting out the purposes of the court. Instead of the traditional criminal approach to children, social scientists were sent in to help the court. Probation officers would try to understand the causes of juvenile delinquency and advise the court so it could make intelligent decisions in behalf of the child. The Dean of the Harvard School of Law made the great statement that the juvenile court movement was the greatest advance in Anglo-Saxon jurisprudence since the Magna Carta. Perhaps it has been because juvenile court concepts have gradually forced their way into the criminal court. There are probation officers in the criminal courts now. There is some understanding of the causes of crime and some attention is focused on the offender rather than just the offense.

These high sounding concepts continued until about five years ago. Then lawyers, academics, and social scientists awoke to the realization that much of what the juvenile court was getting away with was destructive. Staffs were ill-trained, judges had little knowledge, and procedures were so streamlined and informal that children could be booted into state institutions when they in fact were innocent or when they might have done something that wasn't very significent. There was rarely a lawyer in the juvenile court on delinquency matters. A recent study in New York City indicated that of some 20,000 juvenile cases in one year, only four cases were appealed to a higher court. This indicates how rarely a lawyer came into the juvenile court and when he did come in, he didn't know how to function because it was a different kind of court -- it was a protective court. But the point was that there wasn't enough protection. Probation caseloads of two or three hundred were common, and still are common at this moment. When you have this kind of overloading of staff, and ill-trained staff at that, you get a certain sterility, a lack of individualization, and a mediocrity.

In your own jobs I would urge you not to become institutionalized. Don't just fit into the system; be somewhat apart from the system. Keep your own identity as a person. Don't just see it as everybody else sees it. Those of you who have been to State Employment Services will, I think frankly, admit that this is a system that has not advanced as well as it might have. It characteristically sees things the same way year after year. And the same thing happens in the juvenile court. The probation staff sees the child and makes a feeble attempt to say to the judge, "This is Joe." The judge says, "Okay, we'll put you on probation, Joe, and you be a good boy and see your probation officer every week." Now, what does every week mean? It means about two mintues. You should sit in a juvenile court someday and see the children lined up after school hours to visit their probation officers once a week. It is sad. A kid comes in and sits down -- he might sit for a half an hour or more -- and then he's called in. In two or three minutes he's back out and another kid goes in to see the well-meaning probation officer, who lacks frequently the talent to reach out to the kids. He sees them through his own life values instead of through the values of the child. So a boy very often gets into further difficulty. He might skip school or steal a car or get into a fight. His record begins to pile up. The probation officer, who is interested primarily in obedience and conformity, becomes concerned because this youngster is not responding to the rules. He brings this juvenile before the judge and the judge at this point -- and this has happened in many courts around the country -- sends him then and there to a state institution. Now, if the state institution was any good, this might not be so bad, but increasingly, as we begin to look into our correctional institutions, we see that many of them are ineffective and, in fact, contribute negatively to a child's future.

Let me give you some Colorado statistics. Some of you know the boys' institution at Golden. From July 1, 1963 to June 30, 1964, 428 boys entered Golden for the first time; 416 boys came back. Colorado, like many states, has a system of juvenile parole. When a boy leaves the institution, he is attached to a parole officer. I trust you know the difference between a parole officer and a probation officer: The former functions post-institutionally on a state-wide level. In general, probation is a local function and parole is a state function. Since institutions are state functions, when a court commits someone to a state institution, he is later picked up by a state parole system.

Now then, the next fiscal year, from July, 1964 to June 30, 1965, there was a significant drop in that only 290 boys entered Golden for the first time. But 511 returned. Add to these numbers the figures of the state juvenile parole division -- 64 boys during that time were sent to Buena Vista, the state reformatory for older young men -- and these are really frightening statistics. I can't rationalize the way some of the corrections people do: "If we can't help them the first time, we'll pick them up again and reach them the second time or if he has to go on to Buena Vista, then he will get the insight that will help him make it in society." I contend that these statistics tell us that we are failing and, further, that many of these children would be far better off if they were never sent to a state institution.

Who comes to the courts? Statistics revel that sixty-five to seventy per cent of these children come from families earning under $5,000. Does this mean that the richer kids don't do anything wrong? No. They get into trouble, but they aren't caught as frequently. Some of you have ridden in police cars, but have you ridden in the middle class neighborhoods -- southeast or far southwest Denver? I doubt it. By and large, you ride in the inner city area. From the police standpoint this can be justified as there are only so many policemen and they have to be assigned to areas of high criminal offenses. We know that there are more crimes being committed in poor neighborhoods. But it means that the lower-class boy or girl is caught more often than the middle-class boy or girl. The police don't discriminate necessarily against the lower-income kids. This is the area where they operate. Still, to a certain extent, the lower-income children are discriminated against because I have seen that when a middle-class child is picked up, he knows how to act and what the policeman wants him to say. What does the policeman want when he arrests somebody? He wants a quiet, truthful attitude. He wants the child to say, "Yes, I took this and I'm sorry. I'm not going to do it again. I don't know what happened to me. You're right, Mr. Policeman, I regret this." I believe that you find this kind of conforming attitude more in the middle-class neighborhoods. The youngsters whose families and neighbors have been abused by the police don't have this ability to conform to what the policeman wants. They get snippy or hostile or say nothing because they don't know what to say. They are frightened. The policeman, operating emotionally, will more often book this boy than send him home.

You should understand that the police have wide discretion in whether or not they book a boy. In city after city around the country, police statistics show that fifty per cent are released on the spot after a lecture or after their parents are called down to the police station for a discussion. These children are sent home without a court filing. The other fifty per cent are filed on, so there is a discretionary dimension that operates in the police mind and, I believe, that more of the middle-class kids are sent home proportionately than lower-income kids.

Who are the probation officers in most courts? In the cities they are mostly college graduates. In Colorado we have a law that gives me as a judge of a juvenile court $2400 a year toward a probation officer's salary if he has a BA degree and a year of experience. I think that this is a good law. It sets a minimum standard for the probation officer to qualify for state aide. So we hire mostly BA people and a

few MA people, and who are these people really -- obviously, people of the middle class. To the $2400 from the State we add city money so that the beginning probation officer receives $6600 as a starting salary, which for Denver is not bad. The salary doesn't go much higher than this, but it is pretty decent for the new BA with a year of experience. Those who have been around for awhile make $7200 to $7400 a year.

In Denver, and in juvenile courts everywhere, we have to help probation officers avoid falling into the trap of the mathematical system: The first time the child is put on probation; the second time he is sentenced to the state institution (this is held in abeyance if he does a good job); and the third time he is sent up. This is done with little regard as to the seriousness or lack of seriousness of the third offense and without any real knowledge of the child being committed. Institutions are needed. No question about it. We need probation officers, a continuum of care, a variety of facilities, a variety of alternatives to best deal with the child. For some children all they need is the experience of being caught by a policeman; for other children that is needed plus the experience of going to court and getting scared about what might happen -- maybe going to a detention home. Others, because their families are so disintegrated, need a halfway house -- if you want to call it that. They need intensive probation -- not just two minutes a week, but two hours a week or two hours a day. They might need group counseling instead of one-to-one counseling and a chance to see themselves through counselors who are not just authoritarians. Other children truly need state institutions for their protection and for the protection of society.

The accepted national standard limit for institutions for children is no more than one hundred children in an institution. They feel that beyond this number quality suffers. Personalization of experience suffers. The school at Golden, which used to care for four hundred children, is now down to about two hundred-eighty. One of the reasons for this, besides the fact that a few other judges and I have sharply cut back on sending boys there, is that Colorado suddenly moved ahead by developing forestry camps for delinquent boys. This is a rather exciting concept if the camps are well run, and the camp in Colorado, thus far, is well run. It is up in the mountains about forty miles from Denver. It looks like a ski lodge and houses forty-eight boys. Most of these boys have been sent to Golden for up to three months and have been transferred to the forestry camp. This is not a new idea except for Colorado. California has been doing this for thirty years, and so have a number of other states. The state of Washington has a rather ideal set-up. It has been one of the pioneers in forestry camps. This is a good idea because it furnishes alternatives. The Colorado legislature appropriated money a year ago to build a second camp which will open next August in the southern part of the State. Some of the states into which you will be going have never heard of forestry camps, so part of your job could be to help develop the idea and to encourage legislators to visit the camps in Washington or Colorado. Let them know what a good investment it is for their children.

Now, I am going to go back to probation officers, because this is the person you will be encountering most frequently in your work in the courts. Very often they are policeman types. Also, very often they are pretty decent guys. Part of your job will be to help them gather more depth of understanding and insight into your children. Part of your job might be to help them distinguish between deviancies. For example, I fully expect that many of our kids who come from the slums will come up before me ten or fifteen times during their childhood. Some of their delinquenices are minor little things. There was a kid who stole a ten cents bag of Fritos, and hundreds of dollars were expended by the police taking the child to juvenile hall, keeping him there for a few days, assigning him a probation officer, bringing him before a judge, and even putting him on probation for a few months -- for a single ten cent bag of Fritos! These minor offenses don't bother me, but they bother many judges and they bother many probation officers, and you will have to deal with these people. Each time a child is brought in for an offense, there's a cumulative factor in the mind of the probation officer and the judge that this child is not adjusting to our rules so he must be gotten rid of. I don't worry about this, but some do. I do worry if a kid assaults and hurts somebody. I'm very worried if a child sets fire to something. I worry about sexually-connected crimes of violence. I am concerned about violence and crimes against a person. I'm not worried in general about lesser crimes against property, and yet the middle-class community from which we derive most of our values is concerned about crimes against property and they are concerned about cumulative records. So it might be helpful if you can persuade the court not to file a case. The courts have discretion as to whether a case should be filed or not.

Here's another point for you. You will have to sell something to the judge, and the best thing you will have to sell is a plan for this child. Before you see the judge, you had better talk to the probation officer. All urban courts have probation officers. Some rural areas don't, but where they do, you go to the probation officer first. In fact, it's a good idea, if you are new, to get acquainted with both the judge and the probation officer before you have to go into court with a child.

Now, in big cities like Denver there are many judges and many of your cases will not go before a juvenile court. Juvenile court in most jurisdictions serves children ten through seventeen years of age. And in many states it is up to the discretion of the courts as to whether or not sixteen or seventeen year olds will be handled in the juvenile court or remanded to the criminal court. My feeling is that a youngster should be kept out of criminal court as long as possible and even out of juvenile court as long as possible, because the goals and intentions of juvenile court have not been in general effectuated into reality. So again I urge you to visit your juvenile judge as well as the other judges, because, although the age you

will be dealing with most will be the sixteen to twenty-one year olds, some of the sixteen or seventeen year olds will fall into the juvenile court.

Question: We had a boy of fifteen who went to the state penitentiary. Is this possible?

Regretfully, it is possible -- it happened. A judge down in Pueblo by the name of Kikel did this last October. You see in large cities special juvenile courts exist wherein judges deal only with juvenile cases. But in most parts of most states juvenile cases are handled by regular judges who often don't know much about children. Often he has just had a murder case before him and then a juvenile case comes in and he just can't shift gears. Partly, it is not his fault and I can certainly sympathize with him. I can become an expert on juvenile laws because this is my only job. I can read sociology and psychology and visit clinics because this is all I deal with, but he has to be adept at all aspects of law so his experience and his viewpoint are different.

In this case you mentioned these two boys from Pueblo, fourteen and fifteen, were charged with rape. They were poor and Spanish, and I believe they pleaded guilty. Remember that most children do plead -- in my court we don't plead innocent or guilty, we admit to or deny the facts complained of in the petition and virtually every kid will admit to it. Anyway, these kids found themselves rather quickly sentenced to the Canon City Penitentiary. There's a quirk in the law that allows a judge in Colorado to handle children in criminal court.

I was at a statewide judges' meeting the next day and that judge was there. I asked him, "Do you feel better?" He said, "You should have seen those kids, they were terrible." I replied, "Okay, even assuming that they did all this, is this the best place for them or did you do this just because you were angry?" He said, "This was my decision and it is the best decision." This really made me angry so I called a friend on The Denver Post editorial staff and took him to lunch. A few days later an editorial appeared condemning this action, a few good people from a Spanish organization and a Negro who dislike injustice went up to see the Governor, the Young Democrats of Denver passed a resolution deploring the sentence, and these kids were transferred three or four weeks later to Buena Vista. This is not much better for young kids, but it is better than the pen. The penitentiary warden, who was at that same meeting with the judges, didn't like this sentence at all because what was he going to do with a fourteen-year-old kid at the State Penitentiary? This youngster can be victimized so badly by the other convicts. This is not the place for kids even when they have committed serious offenses and our job is to develop alternatives so that a judge knows where else he can send a kid. In urban areas like Denver we have more choices. In rural areas, there is simply nothing. When a kid comes in front of a judge because of a fight or because he has been truant, and the family has fallen apart, the judge hasn't anywhere else to send him but to a state institution because there are not well-developed local services.

Yet, in every county there is some kind of a welfare department which theoretically has a duty to develop foster homes for its children. However, welfare departments in many areas are weak. They see their job as saving local taxpayers' money rather than expanding services. They identify against the kid and this is the sort of thing at which I want to keep hammering. There is often subtle, or not so subtle, identification against the boy who has been in difficulty because he is poor, or because his parents are not of substance, or because there's an obvious difference between his family and the judge's, or because there's a difference between his and the probation officer's values. But these kids are not tuned into our society. They can't be unless we do something more meaningful. Often, unconsciously, a kid is victimized by the very organizations which are supposed to help him. So you have a job to do and, again, take nothing for granted.

Let me go back again to five years ago. There were a lot of people who had become concerned about the juvenile court. Kids had fewer rights than adults in the criminal court. Then came a couple of adult cases that triggered the concern for the juvenile. They were cases in which it was held that a poor person has a right to have a lawyer appointed to defend him against the crime. This was decided by the United States Supreme Court. This Court is one of the great institutions of the last five or ten years. While professors have been quiet, while legislators have been quiet, while people who should be pointing with concern have been quiet, the U.S. Supreme Court has been deciding terribly important issues. The Supreme Court said a poor person has a right to have a lawyer just as a rich person does. Don't we believe in that constitution which talks about equal protection by the laws in the Fourteenth Amendment and due process of law? We have to guarantee the poor the same right of defense as the rich and every court in this land must provide not only a lawyer but effective counseling by an experienced lawyer so that the poor person has the same rights as the rich.

Another case held that if a poor person wants to appeal to the Supreme Court of the State because he thinks he should have been found innocent in the lower court, the expense of that appeal must be paid by the trial court. How does the Supreme Court consider appeals? The witnesses don't appear again before the Court. The lower court records are typed and sent up to the Supreme Court and the lawyers write their briefs and go argue without any more testimony. The Supreme Court has said that in order to achieve equal justice under the law, the poor shall have the lower court record paid for by the court, and this costs hundreds of dollars in itself. The Court has also ruled, that not only the record, but the lawyer's fee for the original trial and for the appeal must be paid from public funds for the indigent defendant. These protections have seeped into the juvenile court and more shall follow.

In my juvenile court children are not convicted of crimes. They are found to have committed delinquent acts. The purpose of the delinquency finding instead of a felony or misdemeanor is so the record of a boy or girl will not haunt him the rest of his life when he has to fill out a form asking, "Were you ever convicted of a felony or misdemeanor?" The answer is "no" since, in juvenile court, he has been found to have committed a delinquent act. Theoretically, this sounds good. Yet I know even a delinquency record hurts a child because employers get smart and in their questionnaires they ask instead, "Have you every been arrested?" These kids have often been arrested. Or they ask, "Have you ever been judged delinquent?"

As I have said, very few lawyers come into juvenile court. When a child comes before a judge, sometimes his parents aren't even around. The judge says, "Son, did you do this?" The kid doesn't know what to say except "yes". Often he has done it, but sometimes, say, five kids are before the judge when only three of the kids were really involved. But the other two knew they had been someplace they shouldn't have been. If these two kids had a lawyer, the case would be beaten because they hadn't actually participated sufficiently to have been found delinquent. However, the kid says, "Yes, I was with my brother and we did this," so the judge puts him on probation and the next time he is in trouble -- Bingo -- he might be shipped off. Each step of the way is crucial in the life of the child I hope you will be helping.

Things have changed to a degree now. When a boy comes before me, I insist that his parents be present. And I insist, and this is new in Denver in the last six months, that a copy of the complaint be handed to the boy or to his parents. You will find in many courts that the boy never gets a copy of anything, not even a copy of the fact that he is being committed to a state institution. However, we are now beginning to give the same protections to a child that an adult gets in a criminal court, although we maintain an informality and a greater total consideration of a child's needs.

Now, let me divide the court into two phases. The first phase is the evidence phase. If a boy, or an adult, pleads not guilty or denies the complaint, there must be a hearing based on testimony under the rules of evidence that have been passed down over the centuries. No hearsay should be admissible, and this has to apply in a juvenile court as it applies in an adult court. All of the rules built up to protect the defendant in an adult court must be there in the juvenile trial. If in a trial a boy is found to have committed the act, a second phase is entered called the dispositional phase where we are not bound by the rules of evidence. We can bring in the procedure for which the juvenile court stands -- the social study, psychological tests, perhaps school reports or family background, probation counselors, and so on. In the juvenile court the judge can take any type of testimony that he feels will be helpful in understanding the child. The first phase is bound by evidence rules; in the second phase the judge can consider anything.

When a boy comes before me, I say to him and his parents, "Have you received a copy of this petition? Do you know specifically what you are charged with -- the date, place, time, and particular violations?" I believe a child is entitled to know exactly what he is charged with. Next, I go through a rather long explanation that is important to meet due process requirements. To a kid it is kind of meaningless. "Do you know you have a right to a lawyer?" These poor boys and girls and their parents have been dragged around. First, they have been dragged by the police to a detention home, then dragged down to the court, and the parents by this time are saying, "Let's get it over with." But I try to explain to them that they have a right to have a lawyer and, if they don't have the money to hire a lawyer, we will get them one. Then I say, "Do you know you have a right to have a trial? A trial means that you can come here and say, 'I didn't do this,' Then the police must put on their case and you can say, 'No, I didn't do it.' You can call your own witnesses and question their witnesses. You can even have a jury trial." I try to explain in elementary form the fifth amendment -- that a child has a right to say nothing about the offense. Only a handful of the thousand plus kids I've met with have asked for an appointed lawyer, but I feel this is important. Other judges are also trying to build protections onto the informality. A sharp criminal defense lawyer can come in and perform all of the impressive defense work in the juvenile court that he does in the criminal court. Off hand this sounds good, but sometimes it obstructs things. He can drag things out. He is very skillful with all kinds of delaying motions, some of which have substance and some of which do not, but the poor kid is stuck in an anxiety freeze for six months until the case is determined. Yet this type of defense must be available as a protection for a child if he or his parents wish it.

Another issue is developing nationally. It used to be that adult offenders were held in jail if they didn't have money for bail. They would sit there until their trial came up six months, nine months, or sometimes a year later. A small foundation in New York City got interested and raised the question, "Is it fair to the poor to let them sit in jail and wait for trial when the rich can easily get a bond?" They hired some law students in New York to research the project and to study the backgrounds of these people who were being detained in jail awaiting trial. They got the judges to agree on an experiment: to release without bond the people with apparent stability -- if their family lived here, if they had wives and children, if they had jobs. Judge Burnett, a very concerned judge, quickly seized on this approach and began the system here in Denver. During the first six months they let out of jail many guys who had been studied. They compared those let out on this basis with those let out on a commercial bond basis and they found that there was a slightly higher rate showing up for trial among those let out on a personal basis than among those let out on a commercial bond basis.

I don't think that bond should be an issue with children. Where are delinquent children kept if they aren't sent home? In Colorado there are only two juvenile detention homes -- one in Denver and one in Colorado Springs. But where else can a kid be put? Sometimes the police send them home; very often they put the kids in jail, although we have a law that says a child shall not be kept in jail except under emergency circumstances and then he shall be kept separate from the adult prisoners. Everyday in this nation children are sent to jails and kept there. Now, a jail may not be all that bad and yet it is rarely all that good. Part of your job, therefore, will be to find out where your kids will go when they are picked up -- and they will be picked up -- and how you can get them out.

Another landmark case was the Escobedo case. This was unusual because the defendant had a lawyer outside and they wouldn't let him see him. He didn't want to talk unless he could see his lawyer first, but they wouldn't let him see his lawyer. Then the United States Supreme Court said clearly one has a right to a lawyer before or during police questioning. The Court did not say that a lawyer must be kept at a local jail, but it said that the police must advise a person that he does not have to say a word and that what he does say might be used against him. The Denver police get a written statement from a person charged with a crime which states he has been informed that he doesn't have to say anything. I foresee that within ten years confessions will be outlawed because it is so easy to coerce a confession. A defendant can be kept awake overnight, go wild, and say, "Come on, I'll sign anything." Police notoriously have used tantilizing methods so it is very difficult to tell whether or not a confession is voluntary. I think a confession should go before a judge at once rather than later as a written statement, but this is still a major police practice and they would scream if they couldn't do it. The police are still screaming because of Escobedo.

In our Denver Juvenile Court probation officers explain his legal rights to a child and his parents and hand them a printed statement of this before they talk to the kid. Most children admit to a delinquency, but I go over their legal rights again in court to try to make sure that they understand everything before they admit to anything. Sometimes children tell the police one thing and they tell me another. I consider what they tell me. I am talking about changes in the juvenile court -- a re-direction from the past which was overprotective but really underprotective.

Another thing is true. More victims keep wanting to come in to see that justice is done. Parents of a child who has been assaulted or a burglarized storekeeper come down to see that I am tough on the kid who did the act. Now, firmness and toughness are often necessary, but they should be applied with the knowledge of who this child is before you. So it is my contention to you trainees that you should come to court with your kids. If the parents want to come also, fine, but you have merchandise that a judge needs. If a boy is in a training program, this is the single best thing that can be offered a judge as to why he should keep this kid in the community. A judge is concerned if there is nothing going for a boy. He is concerned about drift and that the idle brain is the "devil's workshop" and that he'll float with the wrong crowd. He is concerned about his neighborhood and his family being weak, but if he has something going for him -- you and your program -- he might be saved. Not all kids should be saved from going to state institutions, but you can gain a lot of mileage if you know the judge, if you know the probation officer, if you're in the game early, and if you have a plan for the youngster involved. You should stand up and say to the judge, "I'm counseling this young man. He has made a serious mistake and he admits to it, but I know something about this kid and what kind of a neighborhood he grew up in. . . ." You can play this understanding of background angle only so far with some judges. They want responsibility rather than just understanding. Psychological condonation is not enough. Judges don't want to understand that a child is delinquent because he has had a conflict with his mother at age three or that he was toilet trained too early. They are impressed with reponsibility -- middle-class reponsibility. They believe in conformity. They don't like deviation. But you can reach many judges if you can present the gains a boy has made: "He's been in the training program for a month and he has been there everyday. This contrasts with the public school, Your Honor, where he was skipping school a great deal when he was fourteen or fifteen, but I feel he is growing up. He needs a chance to be understood and to become a productive citizen and he has the aptitude to do it. Our government is investing a lot of money in him."

Of course, all of the boys are not going to be that strong. Some of the boys who have come before me through the employment counselors have missed some days of their welding classes. They drink at least one night a week and get into trouble when they do drink -- lots of trouble. It will look good to a judge if you can bring down the head of the training program, especially if that person knows the judge. A good idea would be to take the judges to lunch at the YOC. It's a trick of identification. You want the judge to identify with you and your program and to know that you are a responsible person. Set up an advisory board for your YOC and put a couple of judges on it or a chief probation officer. You are way ahead if you make them feel a part of your program.

I hope you will not take the traditional viewpoint toward these kids when they get into trouble. Many of your boys and girls are going to get into repeated trouble and you've got to remember that authority figures have rejected these kids so often in the past -- their parents, relatives, teachers, employers -- if <u>you</u> reject them, further alienation from society is achieved. Often these youngsters will try to see if they can get you to reject them. They will provoke you. They'll fail to show up. It's a game to see how you react.

If you let this provoke you and you say, "Look, just one more time and you're out," they will give you that one more time. Then you either have to put them out or else you will have to backtrack in order to keep enough trainees in your program. So be very careful about backing yourself into a corner. Only rarely, and after many previous attempts and failures, will I say, "Look, we know each other pretty well by now and I'm going to make it very clear to you that one more of this type of thing and you will go." When they've done it, they're gone because I must stick to my promise. Many judges do this prematurely -- on the second time in court -- and for nothing serious, but the kid has to go to uphold the judge's integrity.

The hope is in your forming a real relationship with these youngsters. The hope is that you will extend yourself, invest yourself, and help them understand why they are trying to provoke you. Let them know that you're with them come hell or high water. If they go off to a state institution, write to them and to their training counselor at the institution. Let them know that you're still with them and that you will see them when they come back. The human element in your relationship is the crucial thing. You will lose some of your boys and girls as I lose some of mine, but these kids cannot lose you. Your identification must be with them. They are not perfect and they will make mistakes. You can let them know of their mistakes and still retain your relationship.

Now, do you disagree with the things that I have said? Do you think I'm too soft?

Question: "What groups of people disagree with you?"

The most disagreement I've been getting lately is from school principals. Let me tell you about it. Six days ago I met with assistant principals of the Denver schools, two weeks before that I met with all of the teachers at a junior high school that is in an integrated neighborhood in east Denver, and a couple of weeks before that I met with some of the top school administrators. They all kept asking me to give more "jolts" to these kids who give them trouble. I took a position that I would not send kids to institutions for truancy alone. The Colorado law says that children may be filed on for truancy if they are habitually truant from school or if they are beyond the control of their parents or guardians to the extent that their welfare or the welfare of others is in danger. There are many filings from parents, especially low-income parents, who have lost communication with their kids. They don't know where else to turn for authority, so they turn to the court. This is good, but it is dangerous because the beginning of a filing can be the beginning of a sequence which can lead to premature removal from a community. Middle-class families go to psychiatrists when they have trouble with their kids; lower-income people go to juvenile court. And these are usually complex cases. Girls most frequently are runaways and a runaway status can be a violation of probation. Often the parents and daughter are out of communication and she will run away again and back into court she goes.

Colorado has a school attendance law that goes to age sixteen. This is a new law in Colorado since 1963. Before that it was a teacher's paradise. They could kick kids out at age fourteen, even earlier if the kids were giving them fits, because there are all kinds of sneaky ways of kicking kids out of school. I think it would be interesting for a poverty program legal service to file a suit against a school board who has booted out of school a child under sixteen years of age. If you set up a neighborhood law office under the poverty program, obviously the people there will have millions of legal problems. They could probably use about one hundred lawyers to help them with their loan suits, with divorce, marriage, and paternity cases, delinquencies, and all kinds of things. But I think -- and this is not original -- it would be interesting to tactically file cases that affect many people. Take a child who has been bounced out of school under the age of sixteen and sue the school board for not developing better programs for keeping this kid in school. "What right do you have to force him out. Maybe it's not so much his fault as it is that of the teachers who don't know how to help him." Or you could file a case against the public housing authority for excluding a needy but troublesome family. The systems were set up to help these people, but often they kick them out instead of trying to find ways to help them. They will deny this, but it is really true.

To get back to the assistant school principals of Denver -- they don't like the sixteen year compulsory attendance law and they would like me to do something about it. I ask them, "What can I do?" I told them that I do put kids into our detention home where we have a school program with three teachers supplied by the public schools. I willingly put kids in there for thirty days if they have been truant a lot and we try to get them back into a regular school pattern. I also told them now I can provide more intensive probation and how I schedule frequent control-type hearings. I see a kid one day and I'm worried about him, so I say, "Let's have another hearing on this in two weeks." Criminal courts don't do this, but juvenile judges have the flexibility to use the value of the control of the hearing. The theory is that the child will act up less if he knows that he has to come back before the judge in two weeks and make a report on how he is doing. I offer some beginning work in group counseling for youth on probation and sometimes assign a VISTA volunteer to the family.

I have a rather exciting program with VISTA volunteers. This is the first use of VISTA's in any juvenile court in the country. Living in the slums in public housing units of Denver are six VISTA volunteers who are doing rather great things with families of children known to the court. Juvenile courts frequently

say that we must help the family to help the child, but, by and large, juvenile courts don't work with the families in meaningful ways. I have at least eighty families who are getting intensive help, not so much from the probation officer, but through the VISTA who is assigned to the case.

This brings up a further point on communication. It is very hard for a probation officer to reach a kid and have him open up, because the probation officer carries a badge of authority. A boy is afraid to say, "I feel kind of guilty because last night I did something and I wasn't caught." He feels that the probation officer has a duty to report this to the court. He doesn't tell him because, if he does, he lands back in court for violating probation.

We are trying something new. There is a significant problem with glue sniffing among young children in Denver, in fact all around the country in urban settings. I went to Washington and came back with $85,000 to do research on this -- not just sitting in court reading case histories of these boys who are sniffing glue, but action research. We have people working in the neighborhoods with groups of glue sniffing children, and with a lot of success. One of the groups has a teacher. I went to the school administration and said, "We have some money. Could we share the cost of an extra teacher as part of our research program to work with glue sniffing boys at a junior high school?" Mr. Oberholzer said fine and our experiment began. It is a class of fifteen kids -- half are glue sniffers and the other half have other school problems. I believe this is the first example in Denver of a small class approach with kids who are not mentally retarded but who are just drifting through school. We have one boy named Eddie who missed one hundred and three days of school last year and who has not missed one day this year. He is off glue to the best of our knowledge, he's been going to school everyday, and he's getting "B's" and "C's" instead of "D's" and "F's". This is not an isolated case either. Other boys are responding to this intensive neighborhood group approach tied into a special school project wherein they get three hours a day of special instruction. They receive more flexible teaching and they are highly regarded. Also, the teacher visits their families in the afternoons, which is unusual because what school personnel ever visits a poor family except the truant officer who asks, "Why isn't your kid in school?" But this teacher says, "Do you know your child has been in school every day for the past three weeks. Not only that, but look at the work he is doing." We have seen some exciting parental attitude changes because they hear someone speaking well of their son instead of poorly; someone in authority thinks well of their boy, so they are kinder and warmer and the boy doesn't keep running away from them. The idea of research and new approaches is not very characteristic of courts and they don't do much of it, but we think we should. We are working hard with the families.

I don't know whether or not you read about the female Negro judge in Philadelphia in LIFE last summer. People thought she was hard on Negro kids, but she was really pretty hard on everybody, especially ADC mothers who had more than one child. Everyone who comes into her courtroom, according to this article, is searched. She even searched probation officers. LIFE described how many knives, guns, and brass knuckles they've taken from people before they walked into the courtroom. She had a bodyguard go with her even when she went to the bathroom. She got a call one night from a man who said, "I'm from the Black Bottoms gang and we're going to get you." The judge had all the members of the Black Bottom gang rounded up and thrown into jail. How, how can you justify from a due process of law standpoint a judge arresting ten people when only one person made the phone call? Preventively, one can argue that this is the way to break up potential violence, but in this country we still believe the one should not be in jail unless there is a reasonable basis on which to believe that one committed a crime. There is no basis in constitutional law for arresting people who have not yet done anything. The law has well-defined standards as to when a person is guilty of something. What if one planned to do something, but then changed his mind?

In Denver more kids age fifteen commit delinquent acts than any other age group. Thinking preventively we should work comprehensively with younger children in delinquency prone neighborhoods. We should work with them before they fall behind in school. It is hard to believe, but we had a child last year who missed one hundred and forty-three days of school out of one hundred and seventy. You ask how a school can let this happen? Well, there are some children who just can't get themselves to go to school. Some of our VISTA volunteers take children to school. Sometimes they walk out the back door. We had a plan with one family that worked pretty well. The VISTA took the boy two days, the mother and the VISTA took him two more days, the mother alone took him two days, and then the sister checked on him awhile. All of you here have done pretty well in your lifetimes, but there are so many children in urban settings who see themselves as failures. No matter what they do, school is difficult for them. Often teachers reenforce their failings. Going back over school records, it can be found that a child had the same kind of problems in first grade that he is having in eighth grade. We need to find ways of catching them early. Head Start is an exciting program which may help change this pattern.

Out of the slums come many people who just don't make it. We are still trying to figure out why some do make it and some don't. Many of my clientele come from the slums and by the time they reach me, it is sometimes too late. We need more services, creativity, and imagination than we have had up until now. We have an idea for a work program for thirteen and fourteen year olds. Someday we might get money to try it. It would be a program that would develop work opportunities for young boys and girls. Pay them, train them, and establish relationships between employment counselors and them. Teach them about money and success.

We have to stick success somewhere into a child's life when his opinion of himself is so low. We've got to break the cycle. I hope some of you can develop Saturday projects for younger kids. Get someone to employ them and given them an experience of success at an early age.

There is one full-time psychologist working with the boys at Golden. There are two hundred and ninety boys there and he also serves the forestry camp which has another forty-eight boys. One psychologist just isn't enough. In California they have been experimenting with caseloads of eight and they have proven that this is actually the cheapest way to do it. It saves money. There is a new law in California which is very radical and pinpoints the future. If I were in California, I would have received a great amount of money for not having sent so many kinds off to the state institutions. California's new law pays the court not to send kids to state institutions. With this money you are to intensify probation services, add halfway houses and camps, get more group counseling, add more psychologists, and instigate other new programs.

We have been pretty stingy with rehabilitation. We have built big expensive institutions, but we have not put in enough good staff to do a good job. We are trying to remedy this now. The federal government is pumping larger sums into this area and the states are becoming more concerned. Training centers are being developed for workers in these fields. You are here now, and you would not have been three years ago. Society is expressing more concern that we do a better job, a more intensive job, and they are willing to pay your way for three weeks of training and to pay staff people and lecturers to give you their thinking. We've got to do this because society is changing so quickly, we have to start catching up with what we haven't done before.

I have just returned from a meeting in Fort Worth, Texas, on the rehabilitation of the narcotic addict. This is a field which has been neglected for a long time, and the old ways of handling addicts haven't worked. Studies have shown that in six months or a year after hospital treatment, no more than five per cent have kicked the habit. In California and New York they are experimenting with ex-addicts working with present addicts, and they are getting better results. A boy could say to me, "You didn't grow up in a slum. No wonder you made it." But an ex-delinquent who had been in Golden and Buena Vista and who was now pretty solid could be more effective working with these boys. It is an exciting new direction.

Colorado has three boys' ranches which are private non-profit efforts set up to help children -- at La Junta, Manitou Springs and Divide. But these facilities cost up to $300 a month and county commissioners don't like to put out money to place delinquent children at a ranch, so, instead of going through a complicated referral system for a boy who might benefit more from a ranch placement, it is all too easy for a judge to commit a boy to Golden or Buena Vista where the state bears the total expense and where, by law, the state facility must accept each person committed. Oregon is one of the few states where the parents of a delinquent youth are charged with the cost of caring for the child in a state institution. But usually a judge, instead of using county money, will send the kid to a state institution and let the state pay the way. It is an easy thing to do. What is needed is for each state to recognize the relationship between the local and state governments as California has done. The Denver Juvenile Court committed one hundred and seven fewer people than the year before. At a cost of $3,000 per year per child at a minimum, the court saved the state at least $300,000. And I think the state should give the court some of that money to do a better job with Denver's delinquents. If this partnership could be developed, the judges would be more interested in programming for youth in or near their homes. We need state institutions for some youth, but we need also to develop more local resources. Let's tie back the youth into the home and community. Give them weekend leaves or a work release plan. Nobody works with the parents of a delinquent child when he goes to Golden. The boy is supposed to go back to the same unimproved family life and make it? There is no halfway house in this state except one for ten girls under juvenile parole. We build in failures. We are not changing neighborhoods or families. We isolate kids, then let them out, and send them back to the same unimproved conditions -- the same families, the same public schools. When he steps out of line again, the parole board swoops in and bounces him back into Golden. What I am saying is that society has failed many of these kids. I recognize that no matter what we do we're going to lose some kids, but we can do a much better job if we all pitch in. We are learning too much about people not to use new methods. It is criminal not to develop the best possible programs and I, for one, would rather spend money in this area than on wars in Viet Nam.

You wonder how to work with the families of these kids? Often the parents are very difficult to work with because they've met all kinds of welfare workers and school principals who have been chewing them out for years. You have to find a way to help them. You have to feel from your heart. We have reached families with several of our special projects. We have gotten into their homes and into their lives. My probation officers sit in a nice office scaring hell out of them and the families use the probation officer to scare the kid. These families can be reached successfully in their homes or in the neutral settings of the neighborhood.

Welfare workers can be the worst. They frequently hurt people instead of helping them. They are cold and rigid or, if they try to be warm, seem phoney. They are taught in school to listen and be friendly, but many of them have real trouble getting through. Don't get caught in this trap of identifying with the system and against the people. Welfare workers too easily find excuses not to render services and not to

give eligibility to those who need money. Too much energy of well-trained people goes into going over clients' budgeting needs. Automation will soon get these things done much more simply and quickly leaving welfare workers more time to devote to caseworking. Social work, like all these things, is beginning to undergo a change which is long overdue. We need to put the "social" back into social work. Many social workers have lost their traditional functions. Instead of being the advance guard, they have hooked on very hard to psychiatry. They have become little junior psychiatrists running around and their frame of reference is Freud, not social ills. If the profession had held up to its purpose, it would be directing the whole poverty program. I believe in social work. Its purpose is great, its methodology wonderful, if its approach can remain on the ball where it should be. I encourage people to go to graduate schools of social work. I don't think it is necessary for effective performance, but it is a decided plus.

It is said that the first ninety days are crucial in a parolee's return to the community. It is very important that there be a plan for every person who comes out of an institution. He should know exactly where he is going, what he is going to do, and who is going to be there to help him. Whether a person is leaving a prison, a delinquency institution, or a mental health facility, there must be something well laid out for him. And this is one place where your trainees might develop important roles by finding training or jobs for those leaving a state institution. Take them into your programs. Meet with them and get them lined up with something. If you can get something going for them during their first three months out of the institution, you stand a pretty good chance for effective rehabilitation.

Professor Jim R. Carrigan

Professor Carrigan received his undergraduate (Ph.B.) and law degrees (J.D.) from the University of North Dakota in 1953 and his Master of Laws from New York University in 1956.

He has practiced law in North Dakota and Colorado and has been a member of the law faculties of the University of Denver, New York University, the University of Washington and, since the fall of 1961, the University of Colorado.

In addition, Professor Carrigan has been Director of the University of Colorado Legal Aid Clinic and is presently Director of the Assigned Counsel Program, which provides legal services to indigent persons in more serious criminal matters, juvenile cases, mental health matters, and similar problems. Students in the Assigned Counsel Program appear in both the trial and appellate stages in state and federal courts. They presently have cases pending in courts ranging from the municipal court at Fort Lupton to the United States Supreme Court in matters ranging from minor misdemeanors to first degree murder cases.

Professor Carrigan has served also as the State of Colorado's Judicial Administrator.

THE LAW AND THE POOR
Jim Carrigan

I do not want to try to give you extensive technical or legal knowledge about what the law is in a particular situation because an hour is insufficient time to give you a legal education. But I do want to review some of the common legal problems that poor people run into and, perhaps, give you some thoughts on how you might be helpful to them. Then we will talk about some of the areas where you might participate yourselves as creative agents in the making of law.

I think it is pretty well known that the symbol of justice is a blindfolded goddess. The goddess is holding the scales of justice. The blindfold is based on the theory that she will render equal justice to anybody who comes before her without seeing who it is that is standing in front of her. She will weigh the evidence in the scales she holds and the person who puts out the best case will win. You and I both know that this is not necessarily true. Mr. Dooley says, "We know that justice is blind, but does she have to be deef, dumb, and have a wooden leg, too?" I think one of the problems we have to face is that the law does disfavor the poor. This is one of the things we have to overcome. The kind of work you will be doing will permit you to help balance the equity of the legal system.

You may have heard of the phrase of Anatole France, "The law in its majestic equality forbids the rich as well as the poor to sleep under bridges, to steal brea, or to beg in the streets." We have plenty of this kind of equality, but if we are to achieve real equality in the courts, we are going to have to put people like you to work on the problem.

The Adversary System and Justice. First of all, I will give you some of the theoretical background of the adversary system in our courts, so you will understand why there is such a problem with poor people. Basically, the purpose of law is to provide an objective, fair means of settling disputes. Without courts, how would we settle disputes -- in the back alley with clubs or by ladies with sharp finger nails or the pulling of hair? The only substitute for this kind of settlement of disputes is through the courts.

A long, long time ago parties in a dispute would hire knights as champions and the side whose knight was victorious won the legal settlement. Today, instead of hiring a knight (which is too expensive), we hire a lawyer. A lawyer may not have as good a standing among the people as a knight, but he is much more available. We don't base the legal system on trail by combat, but we base it on a theory which is pretty close to trail by combat. We call it the adversary system. The theory is that if each side presents its case in the best possible light, giving its arguments on the law and its position on the facts and all of its evidence, before an effective arbiter called a judge or jury that the better side will emerge victorious. It will be obvious to the finder of fact how to decide the case in a fair way. It is rather like Milton's theory about free speech: the best way to decide which idea is the right idea is to let all compete equally and the best one will prove itself to be right. The theory of the adversary system is that the truth will best be found in a court of law where each contending party must compete against the other through the clashing of their respective attorneys. The system really does work pretty darn well if the adversaries are fairly matched and if each side has a competent attorney. But when one side doesn't have money to hire a lawyer or to pay the expenses of a law suit, investigation, gathering of evidence, and depositions, then the adversary system is like matching a heavyweight boxer against a lightweight. There cannot be a fair battle or a fair trial under these circumstances.

What has happened in America for many centuries is that the law has pretty much become the tool of the entrenched establishment. We have to face the fact that, by and large, lawyers are available for people who have money to pay them. There is a new development, however -- a sudden awareness fostered by the government, I think, through the Office of Economic Opportunity -- that the poor people are lawless. Not that they are violators of the law, but that they are without law. They have no legal service. In fact, they have no awareness of when they need legal service, what legal services are, what they cost, or what they can do for them. The poor are just without any law at all. Fifty years ago when a poor man had a terrible belly ache, he died of it; the rich man had an appendectomy. And that is about where we are now with poor people and the law. In fact, it is even worse than that as law, more or less, has even become the enemy of the poor because it is used by people who have dealings with the poor -- lending institutions, finance companies, welfare agencies, etc. People sell them things on unfair contracts and then use legal processes to collect. Who was it who said, "Laws are always useful to those who possess and vexatious to those who have nothing." And this is the problem for which we have to find answers in our generation.

Lawyers and Tradition. One of the problems I think we have to be aware of is that lawyers traditionally look backward. They are taught in law school on the basis of studying past cases -- cases that were decided one hundred years ago. The law is based on precedent, and in the three or four years of law school there is a shaping not only of attorney's knowledge but of their attitudes. They constantly look backward and it is really a bad situation. They do not develop a scientific, inquiring mind. When a patient with a disease appears on the scene, a doctor looks around to see what is available in new drugs and new ways of approaching this illness. But lawyers, by and large, don't approach their problems this way, and this is where I think you people can be most useful -- re-educate lawyers a bit.

Domestic Relations. Before these problems can be approached though, I think we should develop an awareness of what they are, and I'd like to review with you some of the areas where the law seems to have more

contact with poor people. One of these areas which is constantly recurring is the domestic relations area. Family problems such as divorce are common. It costs only two dollars to get married and just about anybody can raise two dollars. So the poor can get married as well and unwisely as the rest of us can. A bad marriage is no luxury in this country; anybody can have one. But getting out of bad marriages is a little more difficult. Generally, divorce will cost at least $200 for just the attorney's fees -- and that is the bare minimum. Add $25 to $30 for filing costs in most places. The poor don't have this much cash available. In a situation where divorce is indicated, you should know that there are agencies available to people who don't have much money. One of them is the Legal Aid Service, which I will talk about more later. Almost every large city now has a legal aid service of some kind and almost every good law school in the country has some form of legal aid available in which senior law students help poor people, as interns aid residents in the medical profession.

One of the problems in the family area that you are going to run into probably is the pressure of some social agencies to force people to get divorces when they don't really want them. Very commonly, families that have children and are on ADC run into a situation where the social worker finds out that the father is living in the home. He may be unemployed for a very good reason. He may have been injured or he may not have the skills needed to get a job. Technically under the law in many states, the children are not eligible for ADC while an adult male is living in the home. But many caseworkers will give you the opinion that a family is better off with a father figure even though the father isn't the most desirable one. It is felt that children ought to have a father present who, even though he may be lazy and even drunk a lot, still gives love to his children. However, we have developed a new version of the Midnight Ride of Paul Revere in this country: it is called the Midnight Raid of the ADC. The caseworkers have taken it upon themselves to go around at night and search people's homes and bedrooms to see if there is a man there. If they find a man in the house, they cut off the ADC to the family. You should know that this is an unconstitutional proceeding. There is no authority to conduct such raids and you can have them stopped. Get the Legal Aid in your city to start some action.

Marriage counseling is available to people who can pay, but it is not to people who can't pay. Very often a court, which has a lot of domestic cases, will have a marriage counselor available. Frequently, a good marriage counselor can save a marriage. From our experience in the Legal Aid Clinic in Boulder where we have handled hundreds of divorce cases for poor people, I would say that most of the people who get out of a bad marriage go right into one just as bad or worse. The children in these situations add parents and a new problem dimension. If marriage problems can be caught early by counseling, it can save a lot of heartbreak. Instead of the high cost of divorce I mentioned, a Legal Aid Society will handle these matters for a fee of $1.00 to $5.00. If the case does go to court, normally there will be a filing fee which runs, as I said, about $25.00. Actually, in our state it is $21.00. We find that when people have to pay something, it is easier to work with them. They have more respect for what they are getting, and retain some self-respect and dignity. In my experience the worst thing you can run into in poverty is the loss of self-respect and dignity. If people don't care anymore about themselves, you really have a rebuilding job to do.

Another domestic problem that is run into frequently is wife beating. This seems to be a traditional sport or weekend diversion in some cultural classes, especially in drinking husbands. There are several obvious remedies that can be applied here. One is judo lessons for the wife. But there are some legal remedies that can be helpful, too. A restraining order can be obtained from a court. Most Legal Aid Clinics will go to court on a wife's testimony and get a restraining order that will be served on the husband by the sheriff so that he realizes that it is a serious matter. If he causes further trouble, he can be held in contempt of court and jailed, but most of the time the men take the restraining order quite seriously. One thing to note is that the husband can't be prosecuted for assault and battery in a case like this. The court can force the husband to post a peace bond, which means that he has to put up $100 or so to guarantee that he won't beat his wife again. If he does, he loses the $100 as well as then being liable for prosecution. The court can restrain the husband from making phone calls, even keep him from conversing with his wife at all, and keep him entirely away from the premises. Since the restraining order is served by the sheriff's office, most persons respect this official document. A man realizes it will be more serious when he punches his wife in the nose the next time and that if he does, he will violate not only her integrity but also the court's orders.

Another problem that is run into frequently is the desertion problem, popularly known in the press as the "fade-away father." It is important that you know that about 200,000 fathers a year desert their families. If they can be found, they can be made to support their families. There is a criminal action known as the Reciprocal Nonsupport Act which most states have. This is the way it works: Mr. George Begotton leaves his wife here in Colorado and takes off. She discovers he has gone to San Fernando, California, so she goes to the District Attorney in Colorado and starts a criminal non-support action here in Colorado which will be forwarded to California and prosecuted against him there. This can be done without hiring a lawyer because it is a criminal action. With this non-support action hanging over his head, the chances are that the husband will start supporting his kids. The real problem is finding these fellows and then catching up to them again if they skip. But eventually they get tired of moving around. Another way to find them is through relatives whom they usually contact.

Occasionally, there are cases in which the wife is the Christine Keeler and the husband is on the right side. Then we hear his story instead of hers and decide he may have been justified in leaving the nagging old bitty.

There are cases where the man needs legal assistance, too, and this is where the legal aid societies have a terrific problem. The Legal Aid Society cannot represent both sides. If the wife comes in first and later the husband shows up just as poor as she and just as in need of a lawyer, there is a conflict of interests and other legal council must be found. Very often a young lawyer with a Don Quixote complex can be found (and most of us have one or we wouldn't be doing this sort of thing) and talked into taking the case as a charity case. This can be done more often than you think. Also, in a city of any size, there is a bar association. Now, by and large, bar associations are just as bad as medical societies, but they do have what is called a lawyer referral service. People who don't have money to pay legal fees can get at least some advice and counsel and legal assistance at less than the usual minimum fees from lawyers who sign up indicating that they are willing to do this kind of work. It is about half charity. For example, a divorce that would cost a minimum of $250 would cost $75 or $100 instead.

Let's take an example of a case. A young lady, we'll call her Prudence Poorman, came into our legal aid office last year and started a divorce action against her husband. She sought custody and support for her only child. He came into our office and showed us some letters she had written just after the child was delivered. In the letters she stated that he was not the father. The name of the father, she indicated, was Joe Snow. This is a pretty common story that can usually be taken with a grain of salt because a man often tries to get out of supporting his child. But in this case we were convinced, because either the conception had occurred by air mail or she was pregnant for fifteen months, as her husband had been in Germany during the critical period when access was necssary. We couldn't advise him, however, as his wife was our client, but we were able to get him some legal help. His lawyer had a blood test taken. A blood test can prove conclusively through blood groupings that a particular person was not the father of a child (although it can't prove that he was). In this situation, the blood test did prove that the husband was not the father of the child.

One increasing problem is illegitimate children. The rate of illegitimate children has increased about 200 per cent in the last two decades, primarily among the lower-income groups. There seems to be a self-destructiveness on the subconscious level in many of the young girls who get themselves into this problem. These girls need help, understanding, advice, and professional counseling on the problems of placement -- if they want to be placed. In many cases the alternatives are deep depression, with a high rate of suicide among these girls, or the desperate seeking of an ill-qualified abortionist. It is important that a girl in this situation know the legal handicaps that face her if she keeps the baby and the handicaps that the baby itself will face. She should be advised by an attorney. I often wonder -- not meaning to be sacrilegious -- if Christ technically was not born illegitimately within the framework of our law. Clearly under our law he would not have been entitled to inherit from Joseph and he could not have received social security benefits from Joseph's account nor would he have been entitled to have Joseph support him. Put in this context, maybe illegitimacy doesn't seem so bad to these people. But there are a lot of problems connected with it, so when girls come to you in this situation, get them to a legal aid clinic or a referral service of some kind.

Too commonly there are situations in which a public agency has brought neglect proceedings against parents in an attempt to take the children away from their parents. They claim they are unfit parents. As an example, a young lady was divorced and had two young children -- one eight months and one two years old. Her husband had deserted her after the second one was born and she had divorced him. She was living on ADC. She was young, twenty-two, and hoped to remarry so she was going out. One night she went out without leaving anyone with the kids from 9:00pm to 4:00am. The children got to fussing, the neighbors heard them, came over, and called the police. The mother was found having some beers with a group of people in a bar. By the time she came to see us, she was very remorseful about her behavior and realized it was not the way to treat her children. But they are trying to take her children away from her on charges of neglect. In these cases the parents charged almost never have an attorney or the benefit of legal counsel because they are poor. Yet, this hearing may sever permanently the only meaningful family relationship the children will ever know. Isn't having some home better than having no home at all? To these kind of people, a law suit is a very complicated proceeding. If they weren't poor and ignorant, they would have lawyers. Maybe they are poor because they are ignorant and they are as ignorant of their legal rights as they are of everything else. In these cases the defense needs to produce medical records by subpoena, question witnesses, cross-examine the social workers and other professional people, and demonstrate proof of the type of home environment that is available these kids. If taken away, the child will be institutionalized. If he is an older child, he probably never will be adopted.

Juvenile Matters. You have had a session on juvenile procedings with Judge Rubin, I believe. You should be aware that Judge Rubin is an exceptionally well-qualified, well-trained, and sensitive juvenile judge. Until recently in this state, juvenile matters simply were handled in county courts. Most of the judges were not lawyers; they were retired sheriffs or, in effect, J.P.'s. Many of them were very old people and had little to do with young people and their problems. This is still a fairly common pattern around the country. So you have got to provide some leadership in dealing with people who have no understanding of children's problems.

It is not the people of Colorado versus John Jones, but the people of Colorado in the interest of John Jones. In this area Spanish-named kids are sent to reform school when they get into trouble; Anglo kids aren't. This is a fairly common occurrence mainly because there is nobody to battle for the rights of the Spanish-American kids. The tendency in a juvenile court is to assume that the kid did what the police charge

he did. The usual court rules of evidence are not enforced. In other words, hearsay runs rampant through the courtroom. If a juvenile is put on the stand, he may incriminate himself through his own mouth. This is something we wouldn't consider doing at the trial of the most hardened criminal with a thirty year record of every kind of crime and violence. Once a child is named as delinquent, there is a stigma that will obviously effect this child for a long time. It is ironic to me that the adult criminal, no matter how experienced he is in court proceedings and no matter how well he knows the ropes, is entitled by the United States Constitution to counsel. He should be, but it seems to me a child should also be able to have counsel. I am convinced that the Supreme Court will soon hold this to be so.

If you are working with kids who are in trouble, be sure to advise them to ask the court to appoint a lawyer for them. This should be done at public expense; it shouldn't cost them anything. Make the record. Make sure in open court, while the court reporter is working his little gadget, that the child stands up and says like Clarence Gideon said, "I want a lawyer and I think the United States Constitution entitles me to have a lawyer." If it is not a court of record, as some of these courts are not, then write them a letter. Have his parents or somebody write the judge asking him to appoint a lawyer so there is some kind of record on the case. Many courts, when put on this spot, will appoint a lawyer for a juvenile.

I would guess that you all probably know somebody with problems of expulsion -- a "dropout" by people who don't want to take any responsibility in a situation which is actually a "force out." Expulsion is another area where a child should have some equal rights before he is thrown out of school. An education is his only bridge to a decent life afterwards.

One thing that I think you might work on is something that bothers me a good deal -- the excessive costs and charges imposed in our "free public schools." I'm talking about charges for textbooks, which are very common, about charges for gymnasium fees, about laboratory charges, etc. True, in many areas as in Colorado, a child doesn't have to pay these fees if the parents will take a pauper's oath. Many kids, to avoid the embarrassment of this situation, will just throw up their hands and drop out. But the whole theory of the public school system is that it is supposed to be a free system. However, this is just touching the obvious costs when we talk about textbook fees, gym fees, and lab fees. There are a lot of other costs involved in fully participating in a public school that we, as a society, can damn well afford to pay. We can afford all the bridges and highways that we need. Why can't we afford a few textbooks? It seems to me that whenever anybody makes an issue of this, the officials back down in most cases. One of these days we will get the right law suit and take the case to the Supreme Court.

Question: Why doesn't the juvenile judge automatically get a lawyer for the kids who don't have one?

Well, it's a good question. Juvenile judges, by and large, are impressed with this theory that they are trying to help the child. God help us to survive all the ravages from all of the people who are trying to help us. There are two ways to look at the question. Maybe the juvenile didn't feel he was the one who threw the rock at the window, but the policeman says he did and the judge assumes the policeman is right. There is no constitutional right yet established in this country -- no right of counsel for a juvenile in a juvenile case. In fact, the only cases that have counsel go the other way. There are no United States Supreme Court decisions on this point, as I said before, and I think that if the problem is ever properly raised, the Supreme Court will hold for counsel. The other theory, if course, is that "we are only trying to help this youngster" and most judges do perform their task in good faith and help the youngster. But certainly, if there is any kind of a serious charge, there ought to be an attorney representing a child in juvenile matters. The youth should not be made to incriminate himself any more than anybody else should. There ought to be real evidence against him before he is judicated. He should automatically receive a lawyer. When put on a spot, the judge will enforce this, but how many juveniles know enough to ask for an attorney. This is the problem and this is where you can be of help. You can see that the youngster's family knows that he ought to ask for an attorney and keep at it until he gets one. And it should not cost him money.

If we really had institutions where they made a serious effort to get at the kids' problems, if we really had centers where we were treating these kids, everything would be fine. But a "loving parent" doesn't want to throw a kid in with others who have had a lot more experience with crime. (Some of them may be homosexuals, many of whom will give this kid a postgraduate education in crime.) At least I don't know of any parent who sends in application forms wondering how to get their child in an institution. I think this "loving parent" -- and that's the court's role -- should act more like a loving parent. But we can't blame anybody but ourselves because, after all, we <u>are</u> the state and as taxpayers don't vote for decent support for good mental health programs and good institutional programs and, perhaps, that is why we have so much crime.

When a child is forced out of school, he certainly has a right to a hearing. Due process of law entails, among other things, the fundamental proposition that no right of value, whether life, liberty, or property, can be taken away without notice and a hearing. A notice must be given describing the charges against one and one has to be given a hearing in which to present his side of the case to an objective body of some kind. One also has the right of appeal. One can go to court and contest the validity of that expulsion. For instance, I had a case last year in which a young boy of Spanish extraction complained he was being discriminated against by the school system's refusal to let him transfer to another school. He wanted to get more manual training than his school provided and another school within the same district had

better courses and equipment. He felt that he was being discriminated against because of his ethnic background in being denied that transfer. We took the case to the school authorities -- to the superintendent of the schools of that district -- and as soon as it became apparent that we were going to get the State Anti-discrimination League to investigate and make it a public matter, we got results. The glare of publicity is sometimes all one needs to solve these matters.

If an attorney, somebody representing the youth, goes and just talks to the school officials, it is often enough to get things worked out. They can be made to see frequently that they aren't treating a boy fairly in an expulsion case, and they will give him a second chance. When officials deal with a lawyer, they know there's a shotgun behind the door and that they aren't going to be able to sweep problems under the carpet. Going to court is a last resort when everything else has failed.

Institutional Commitment. Frequently, we run into the problem of mental health in dealing with poor people. It is a circular thing: poor mental health has caused poverty and mental health is then worsened by poverty. These people live in a depressing, hopeless situation without beauty, challenge, ideals, ambitions, or goals. Very frequently, they are subject to being tucked away in institutions where they are more or less stored away for life at a low cost. Many mental institutions are just human storage vaults. We have a due process problem in Colorado in the mental health area. In this state the letter of one doctor, who may not even have examined the person, can be the basis of what is called "the hold and treat order." This means hold the person for ninety days and treat him for his mental health. There should be a better showing than that to take away a person's liberty. The people have to be told about their rights.

Sales Contracts. A real problem today is the poor as debtors. Poor people are notoriously unsophisticated buyers and, thus, easy prey for high pressure door to door salesmen. Often these salesmen deal in inferior goods, excessively priced and easily available through extended credit. In Colorado the interest rates are especially heavy and they are special traps for poor people. For example, take the maximum interest rates on cars. The lowest limits are on the newest cars. As the cars get older, the allowable interest rate that can be charged in selling them is higher. The effective interest rate that can be lawfully charged on a car three years old is thirty-four per cent. And that's low. In many states it is three hundred per cent, and the people who buy these old cars are, by and large, poor people. When I buy a car, I go to the bank, sign a ninety-day note, and pay a flat five and one half per cent or whatever the going rate is. I may renew the note for another ninety days and make a payment to reduce the note. Other people go through GMAC or a similar system, paying approximately nine and one half per cent by the time they are finally finished, and even that isn't too bad. But poor people go to finance companies or deal directly with the used car lot, and they end up paying the highest interest. It is important to know that when people get into these situations, collection agencies to whom these contracts are almost always assigned, will usually settle for a lot less than the face amount owed. If a person is being hounded for a $100 debt, it is very rare that it couldn't be settled for $25 or $50. Poor people don't know this. Often the car or appliance they purchased is repossessed, but the poor person still must go on paying for it.

Then there is the good old open end chattel mortgage. For example, a person buys a refrigerator with a general mortgage on it. Everytime this person buys something else, it is kept on the same paper as the first mortgage. There may be a refrigerator that is three years old, a TV set that is two years old, and two or three other appliances all on that chattel mortgage. The items that have been paid for are not taken off the list, so if the person buys a new toaster and is not able to pay for that, everything can be repossessed.

Partly, this is a cultural problem. A lot of these people are not consciously afraid, but are unused to going out of their local area to do their shopping. They deal with someone in the block whom they have known for years and who is always affable, friendly, and lovable. As a consequence, they pay sometimes twice what they would have to pay if they drove a few miles to a discount house. They don't try discount houses because they don't buy for cash as a discount house requires, but I think a lot of this can be remedied by education.

There are cases where some of these contracts are being tested. There was one in the District of Columbia in which a contract was broken as "unconscionable" contract. The courts are finally waking up to what is going on, but for years and years these kinds of cases never got into court because these people didn't have lawyers. In larger cities the Office of Economic Opportunity has started neighborhood law offices where people can drop in after working hours. They know they needn't worry about large fees. They can obtain legal services and find out what their rights are. Many of these unconscionable contracts are going to be broken, because the bright young law students in the neighborhood law clinics will spend a lot more time on a case and work harder on it than any lawyer could possibly afford. A lawyer's office overhead costs about $15 an hour just to keep the door open by the time he pays his rent, his help, and for his machines, etc. He has to produce about $30 an hour to make out, so he can't put as many hours into a case involving a $200 refrigerator as may be desired. But to these law students, these cases are their whole career. They love to win them.

Landlord and Tenant Problems. For generations law has favored the landlord. One of the real problems is eviction. This will happen often to the people with whom you will be working, particularly if they complain to their landlord during the winter that the temperature inside the house is down to fifty degrees or that the sewers have been plugged up for a week or that their baby is being pushed out of the crib by the rats. In eviction some kind of notice is required. In the slum areas of big cities the traditional method of serving the process of eviction notice is called "sewer service." Instead of handing the summons to the tenant or tacking it on his door, it is jammed down the sewer. The tenant never hears about the eviction at all, never goes to court and presents his side of it, and the next thing he knows the sheriff is taking his furniture out into the street. He doesn't have money to hire a lawyer. So tough! The tenant was a troublemaker because he wanted some rights.

Complaints are seldom taken seriously by landlords. However, I think with the legal services being made available through the OEO, this sort of problem can be taken care of. The tenants can band together and let the landlord know that until the building is brought up to the standards of the building code, the sanitation code, the health code -- no more rent! No one is going to throw them all out. Publicity in this kind of situation is very helpful. Newspapers can make it a crusade against the landlord, and the same can be done with the bad sales contracts.

Police Relations. Let's talk a minute now about the problems the poor have with the police. It is obvious that we all tend to react to people according to their appearance and the police, being human, sometimes tend to treat poor people just a little differently. It is not a conscious anti-feeling toward minority groups. They just treat these people with less deference and respect. If you don't believe it, cruise around some night in a big city around midnight or spend two or three hours in an area like the one outside of this classroom. Follow an officer up the street or follow a police car that stops an old rundown beat-up car. Then go a few blocks up toward the Denver Country Club and watch the police patrol stop a Cadillac -- or ignore it. It is a different kind of attitude entirely. Many police officers are not too well educated themselves and they resent people who cause them problems. They don't have much insight and aren't socially oriented enough. We cannot expect, with what we pay them, to get very well-qualified men. We are lucky to get what we do.

Police do react differently and faster in the poor areas. For example, in answering a call from a Spanish-American club here in Denver, a lot of violence occurred that I'm sure would not have occurred in the Cherry Hills Country club. In fact, there wouldn't have been a call probably because that kind of conduct isn't unlawful if you are doing it in the right place. Maybe it isn't unreasonable that the police react differently. If any of you women drive through a slum area at night, you probably roll up the windows and lock the doors, don't you? If you come to a red light, you are a little edgy if there is a group of men on the street corner.

A case I have pending right now in the federal district court is that of a young Spanish kid from Fort Collins who went out looking for work. His older brother was doing the same and they stopped in a small town in that area to drink a beer. At the tavern they ran into four young men from New Mexico who also were looking for work. The boys from New Mexico left first with the boys from Colorado following about five minutes later. As the Colorado boys were leaving town, they noticed that the New Mexcio kids' car had been stopped by the local town marshal. They stopped to see why the marshal had stopped the other car and as they questioned him, the marshal became rather obstreperous. He is a gigantic man who weighs about two hundred-forty pounds or so. My client is a young man of nineteen who weighs about one hundred-five or one hundred-ten pounds. My client was standing in front of the license plate of the New Mexcio car when the officer wanted to write down the license number. In the confusion, the officer apparently asked the boy to move, but the boy didn't hear him. The officer thought he was being smart so he pulled out his gun. He claimed he shot near the boy to scare him, but instead he shot him through the leg. The officer claimed the boy jumped in front of the bullet. We are suing.

I can't believe for one minute that if I had been out on that road, dressed the way I am in my car, standing in front of that license plate, that that cop would have shot anywhere near my leg to try to get me out of the way. First of all, he could have picked me up and put me anywhere he wanted to, including the car trunk, so I don't think there was any need for the gun at all. It was a difference in attitude. Very often these incidents start out of minor matters such as a car stopped by an officer. The policeman becomes disrespectful simply because of the skin color or ethnic origin, and the person who is stopped quite rightfully is offended by this, becomes angry, an argument begins, and soon they come to blows. If the police would treat everybody with respect, they would surely save a lot of broken noses -- in their own departments. Federal treasury agents who work narcotic cases don't use force because they have more finesse. They do what they have to do, but they are the last people in the world to be offensive to their contacts. They call a person "Mister" and treat him with great respect. They are wary because they are doing dangerous work. If the police department worked in this way, we would have a lot more success.

There is a great deal of police harassment. The poor are frisked by the police to see if they have any narcotics or guns or anything on them. Very often this happens to colored people out walking at night in white neighborhoods. It happens here in Denver. I have a friend who is a colored lawyer and he has been stopped and frisked many times in his own block. I've asked him why he doesn't do something about it and he replied, "I would rather not personally do it, but I would back up someone else who started it."

It is not legal to make an arrest unless there is a warrant for the arrest signed before a magistrate on a sworn complaint or unless the officer actually sees a misdemeanor or a felony committed in his presence. Otherwise, he cannot make an arrest.

Vagrancy is defined in about fifty different ways, one of them being a person of poor reputation in town without a visable means of support. Vagrancy is a status, and it is very doubtful whether the Supreme Court is going to uphold a crime which is merely a status. Basically, vagrancy is the status of being poor. To take an example, if a person is unemployed and walking around at night, but he is drawing unemployment compensation, he is not subject to being a vagrant. When his unemployment compensation runs out and he no longer has a source of income, he is subject to being arrested for vagrancy.

One area where we have made some progress is drug addiction. In this country we have a very punitive agency called the Federal Bureau of Narcotics. They insist on the theory that the way to solve the drug traffic problem is to put the maximum penalty on everybody who is convicted as a drug user or pusher. This has prevented any real effort being made toward getting at the causes of addiction and treating the addict. We do have a case now in which it was held that the mere status of drug addiction cannot be made a crime. The State of California made it a crime to be a drug addict and, incidentally, it is still a crime in Colorado. But the United States Supreme Court said that the mere status of drug addiction is a disease not a crime. Therefore, it can't be made a crime and somebody punished without violating the punishment provisions of the Eighth Amendment. That applies to the due process laws of the Fourteenth Amendment and there are several cases pending now applying the same provisions to alcoholism.

One judge in Chicago is quoted as saying that he handles about one hundred-fifty drunkenness cases a day. This is just one judge and there are over a hundred judges in Chicago. It is admitted that there is no treatment available for these people, so they are thrown in jail and let out the next morning. They are the "revolving door drunks." Some of these people are arrested as many as six hundred times for drunkenness. I think that the cost to society is so great that it would be much more economical to face the problem and try to do something about it instead of just running these people in and out of jails all the time. I believe that within the next year or two we will have a decision on this problem of drunkenness from the Supreme Court as to whether or not it is a crime.

It is clear from what has been said here earlier that everyone understands that if a person is charged with a felony, he is entitled to have counsel paid by the court and state. That is true both in state and federal courts. It is a constitutional right. In most states a felony is a charge for which a person can be sent to the state penitentary -- robbery, assault, murder, or any form of manslaughter. Minor crimes, such as petty larceny, are called misdemeanors, and the maximum penalty here is up to a year of imprisonment in the county jail. There is not yet a Supreme Court decision with respect to counsel for misdemeanors, but many courts are providing attorneys for misdemeanor charges. The person who gets into this kind of scrape, therefore, ought to be advised that he needs counsel. Generally speaking, he is a person who has had less exposure to the law and probably knows less about his own rights. He needs counsel.

Legal Assistance. I have mentioned in passing some of the legal sources available for the poor, particularly Legal Aid Clinics. These are agencies generally available in any populated area or city. They will serve only indigent persons. When the person goes in for his first interview, he must meet certain indigent standards as to his income before he can be accepted. Also, as I have said before, most good law schools have some form of legal aid. Most of them will take almost all kinds of cases, although some will not accept domestic relations cases nor bankruptcies. Bankruptcy is a federal proceeding and, unless the law students are practicing in a federal court, they won't take such cases. We don't.

Most legal agencies are financed by charitable agencies. They have limited staffs and far too many cases. For the person who has a little money, but not enough to hire a lawyer, he can go to the bar association and ask for a lawyer referral service. He will be provided with a lower cost service than the usual minimal fee. For example, in Denver the agreement of lawyers who take these cases is that they will charge no more than five dollars for the first half hour of consultation. Often a legal problem can be solved just by advice. This has got to be made known because many poor people live in horror of the prospect of seeing a lawyer. This is probably because the only lawyers they have known are prosecuters and collection lawyers and the poor people always come out on the wrong side with these birds. Also, they've heard that Aunt Susie went to a lawyer's office and had to pay a fee of $500. So, if they are told that they can consult with a lawyer for $5, they are more likely to go and find out what their rights are and decide for themselves if they want to pursue them or not.

In small towns, as I have said, you can find a local lawyer who often can be prevailed upon in the true professional spirit to help in a case like this, especially if he feels an injustice is being done. He will mount his white horse and ride off into the sunset. In a personal injury case, a workman's compsensation case, an automobile case, or a case where a man is hurt on the job, lawyers will take these cases on a contingent fee basis. The person doesn't have to pay anything if he doesn't win the case. If a man breaks his leg or is hit by a truck and receives a low back injury so that he can't work any longer, he is entitled to workman's compensation -- probably a sizable amount. But he is not going to get the full amount unless he has an attorney who knows the ropes and can argue points. These are the kinds of cases the attorneys

will accept on a contingency basis. Certainly, injured persons should have some legal advice before they settle claims with an insurance adjuster. Obviously, the adjuster's job is to settle the claim for as little money as possible. The lawyer's job is the opposite. His job is to get as much money as possible from the insurance company. The fees run about twenty-five per cent of the recovery if the case is settled without going to court and about one third if it is settled after going to court.

There are other organizations who are really doing superb work in the area of providing legal services. The American Civil Liberties Union, for example, will take on any kind of civil rights or liberties case and it doesn't cost anything. In Colorado they have an Itinerant Panel that serves minority groups in the areas outside of the urban centers. They travel around the state. Many unions provide some form of counseling, especially on unemployment claims, workmen's compensation, social security, etc. They can tell you when you need a lawyer and when you don't. The Legal Defense Fund and CORE have been doing very good work whenever there is a civil rights flavor to the case and sometimes just when they feel there is an injustice involved. More recently, the Lawyer's Constitutional Defense Committee has been established to work in the South. This is a cooperative group of NAACP and CORE and other legal groups concerned primarily in civil rights cases. State and federal agencies, of course, are available. The neighborhood law offices which the OEO is in the process of setting up in every major city seem to provide great promise because they are not looking to provide a salve or ointment to cover a particular case, but in working on the cause of it. I think they will be doing a great deal of creative litigation in breaking many of the barriers.

In closing, let me say that, as you become interested and aware of the legal problems of the poor, you will discover legal resources of your own -- acquaintances who are lawyers or friends of your friends. Your role in educating them about the legal problems of the poor is as important as educating the poor about their legal rights. As you and others like you take on this task, the inequities of the law which now press upon the ignorant and poverty stricken will be corrected, for the law is self-correcting when the people care.

## PROGRAM ANALYSIS AND EVALUATION

The evaluation of the University of Colorado Employment Security Institute II is divided into two sections. In the first section we have followed the same general procedure for obtaining and analyzing information from participants regarding the impact of the training program that was established during the first training program. On the first day of the training, participants were asked to complete a series of questionnaire instruments; on the final day of the program, the same instruments were again administered. Three instruments, Schedules C, D, and E, which were developed for the initial training program were used to assess the impact of this program. As will be seen in the following pages, the response to these instruments is essentially the same as was encountered during the October, 1964, program. (See Chapter VII, The Colorado Story, page 87.)

In the second section the research staff has sought to obtain information to answer questions which arose following the evaluation of the initial training program: What are the characteristics of a youth counselor who is considered effective in his role of assisting high school dropout youth? What are the characteristics of the counselor who is considered ineffective with this population? Are there some dropouts that the counselor feels he can be more effective in aiding? Are there some youth that can be identified as extremely difficult to help? How are they different from those that can be assisted with ease? Are there some new kinds of rewards associated with working in a Youth Opportunity Center? Are there any particular characteristics of a counselor which make him enjoy the YOC more than the more traditional Employment Service positions?

These are questions which go far beyond the evaluation of the Employment Security Institute training. However, the answers to these questions have important implications for the design and content of future programs. Instruments A, B, F, G, and H were designed with the purpose in mind of obtaining hints or cues about the answers to these questions. We say hints or cues rather than answers because the thirty six participants in the training program may or may not have been representative of the kinds of persons who work in Youth Opportunity Centers. Moreover, thirty-six persons is much too small a sample to use for statistical purposes. However, the participants in the training program could provide us with ideas about how to seek answers to the major questions. And this they did. The instruments which we developed asked participants to indicate their opinions about the youth they serve, their fellow counselors, their ideas about the difficulty of changing certain personal traits in the youth with whom they work, and their reasons for working in a Youth Opportunity Center. The results of these questionnaires are summarized in the second part of this program evaluation section. Two of the instruments were analyzed by cluster analysis, a relatively sophisticated process which was accomplished under the supervision of Dr. Jules Wanderer, a member of the University of Colorado's Department of Sociology. The other instruments were subjected to content analysis, a particularly demanding task, by John Quicker and Earl Schwartz who are candidates for the Ph.D. degree in Sociology.

In addition to the questionnaire schedules which were administered to the training program participants, each participant completed a daily log of his impressions of the training program. This procedure was used during the first training program and served two purposes. First, since the logs were completed each evening and handed in the morning of the following day, each participant was caused to reflect on the meaning of each day's activities. Second, day to day feedback from the logs was used by the staff to keep in touch with the way in which the program was being received and interpreted.

SECTION I

SCHEDULE C

This instrument was designed to determine initial and final attitudes about behavioral science content presented during the three week training program. Since it is described in considerable detail in The Colorado Story (see pages 111-129), only the modifications in the instrument and the results are reported below. This instrument originally consisted of ten statements which the respondents were asked to check "agree" or "disagree" and give their reasons for selection of the response. The response from the Colorado I participants suggested that the instrument could be improved by permitting the respondent to indicate the degree of his agreement or disagreement -- "strongly agree," "agree," "undecided," "disagree," or "strongly disagree." The questions and results are reported below.

| Strongly Agree | Agree | Undecided | Disagree | Strongly Disagree |
|---|---|---|---|---|
| (1) | (2) | (3) | (4) | (5) |

1. Our present federal, state, and local government systems are sufficiently flexible that the economic problems confronting us day by day can be solved within the existing framework.

| Mean Response Before | Mean Response After |
|---|---|
| 3.00 | 2.80 |

2. Primary group relationships (family, close friends) are exceedingly influential in determining an individual's aspirations and ultimate success in finding and keeping a job; such relationships are more important than other objective conditions in the community (employment market, economic conditions, etc.).

| Mean Response Before | Mean Response After |
|---|---|
| 1.97 | 2.36 |

3. In order to understand the behavior of unemployed high school dropouts, one should stress the importance of gang influences over the influences of home and family environment.

| Mean Response Before | Mean Response After |
|---|---|
| 2.89 | 3.20 |

4. The limits restricting the teaching of new job skills are based more upon our understanding and retraining than upon the retrainee's innate limitations.

| Mean Response Before | Mean Response After |
|---|---|
| 2.50 | 2.61 |

5. While inherited or innate characteristics establish limits to what a man can do, his environment is the final arbiter in the determination of just what he can accomplish within these limits.

| Mean Response Before | Mean Response After |
|---|---|
| 2.28 | 2.19 |

6. The problem of chronic unemployment and poverty in this country is largely the fault of our culture's way of causing and handling it (i.e., the fault of the "system" as a whole) rather than the fault of individuals. A substantial solution to the problem can be accomplished with appropriate changes in the system.

| Mean Response Before | Mean Response After |
|---|---|
| 2.56 | 2.13 |

7. One thing holding back the progress of minority groups is their lack of adequate role models; that is to say, the few Negroes or Spanish-Americans that make it soon reject their ethnic identification and assimilate into the majority culture.

| Mean Response Before | Mean Response After |
|---|---|
| 2.56 | 2.50 |

8. Once a way of handling a problem (such as chronic unemployment in a city) has been established in organization structures, there is a strong tendency for procedures to become stable and then, in time, become sterile and out of touch with the basic problem. Such "organizational inertia" is more often the basis for the lack of needed change than is the absence of creative reformers, who would sweep away the old in exchange for some new plan.

| Mean Response Before | Mean Response After |
|---|---|
| 2.08 | 2.00 |

9. The main reason that our poverty problems have not been effectively dealt with in the United States is that the dominant middle class is unaware of, or does not understand, the causes and extent of poverty.

| Mean Response Before | Mean Response After |
|---|---|
| 1.97 | 1.75 |

10. The counselor should be careful <u>not</u> to involve the dropout in a training program that too quickly separates him from his cultural heritage.

| Mean Response Before | Mean Response After |
|---|---|
| 2.83 | 2.44 |

<u>Interpretation</u>. None of the changes are considered statistically significant, although the direction of the changes tend to reflect, in the opinion of the staff, the content that was presented during the training program. The general orientation of the training program participants regarding these statements was relatively sophisticated prior to the training program. The average score of the group, of course, masks changes which occurred in the orientation of several participants whose reported orientation changed more extensively in a favorable direction.

SCHEDULE D

This instrument was originally developed on the basis of a content analysis of an essay on the nature and causes of poverty written by participants in the first training program. Participants in Colorado II also prepared such an essay, but the essays reflected so much the same content as the previous descriptions that it was decided to leave the content of this instrument the same. (For the original form of this instrument, see The Colorado Story, pages 104-5).

Interpretation and Comment. The results of Schedule D responses are similar to those obtained during Colorado I (See The Colorado Story, pages 104-110). In order to explain our interpretation of the results, some explanation of training program content must be given. Considerable emphasis was placed on the recognition that poverty in 1966 is different from the mass poverty of the 1930's. In the thirties many highly skilled workers were unemployed as a consequence of the breakdown of our economic system. Today our economic system is strong, but technology has caused the educational requirements essential to obtaining jobs to rise.

Poverty, although it affects single individuals and their families, is not predominantly a psychological problem. Persons do fail to express initiative and ambition, but we believe this lack of ambition is more a consequence of being raised in poverty and never being exposed to the full possibilities for upward social advance than the cause of poverty. Poverty is a social problem which can be solved. Social and behavioral science has considerable knowledge which, if applied, could make large inroads on poverty. The knowledge has not been effectively applied to date. The War on Poverty now provides us with funds and new agency structures which will permit the application of our knowledge of poverty and related problems.

This brief outline of some of the content presented in the training program will suffice to show why we interpret the changes shown on Schedule D to reflect favorably on the program.

Under Part 2 of the instrument -- "poverty is mainly due to:" -- "lack of individual ambition to succeed" drops to ninth position from a rank of seventh indicating to us that participants accepted the idea that social structure and environment are influential in poverty. "Lack of job opportunities" changes from a rank of third to second, "lack of resources" changes from eighth to seventh, and "poor welfare and employment laws" changes from ninth to eighth. Each of these changes is supportive of the interpretation that participants heard and accepted the staff's orientation.

Similar changes may be noted in Section 4 -- "the most important obstacle to the solution of the problem of poverty is:". "Lack of money to support projects designed to reduce poverty" changes from fourth rank to eighth. This implies that participants became informed about available funds and procedures for obtaining them. Although the rank of "lack of expert knowledge" does not change, the mean score does change. Since the change is statistically significant, this indicates increased agreement among participants and decreased variance.

Item I, "obsolete or backward government agency structures," shifts from ninth place to sixth as an obstacle to the poverty problem solution. This change probably resulted from the continuing contact program participants had with basic instructors and other indigenous poverty persons who continually experience the failure of welfare departments and the Employment Service to provide them with adequate service.

Ranking of Opinion Statements Before and After (N=36)

1. In most urban communities in the United States poverty is:

| | Mean Before | Mean After | Rank Before | Rank After | Rank Change |
|---|---|---|---|---|---|
| a. primarily confined to ethnic minority groups. | 2.61 | 2.47 | 1 | 1 | 0 |
| b. confined to people who lack an achievement orientation. | 3.31 | 8.28 | 2 | 3 | -1 |
| c. mainly a matter of definition -- hardly any person is really suffering in the U.S. | 8.14 | 8.28 | 9 | 9 | 0 |
| d. a way of life generally acceptable to those who lead it. | 6.08 | 6.69 | 7 | 8 | -1 |
| e. confined to sub-standard slums. | 3.61 | 3.06 | 3 | 2 | +1 |
| f. more a problem in the east than in the West | 4.44 | 5.30 | 4 | 5 | -1 |
| g. confined to people receiving welfare aid. | 4.78 | 4.86 | 5 | 4 | +1 |
| h. a normal condition that can never be eliminated. | 5.58 | 6.03 | 6 | 7 | -1 |
| i. a problem of individual cases rather than a community problem. | 6.44 | 5.31 | 8 | 6 | +2[a] |

2. In most urban communities in the U.S. poverty is mainly due to:

| | | | | | |
|---|---|---|---|---|---|
| a. lack of individual ambition to succeed. | 5.67 | 7.14 | 7 | 9 | -2[b] |
| b. lack of skills and education | 2.08 | 1.56 | 1 | 1 | 0[c] |
| c. lack of job opportunities. | 4.19 | 3.58 | 3 | 2 | +1[d] |
| d. discrimination against minority group members. | 4.03 | 3.86 | 2 | 3 | -1 |
| e. lack of knowledge of other possible styles of life. | 5.39 | 5.89 | 6 | 6 | 0 |
| f. the economic structure of the community (e.g., lack of industries which employ unskilled labor.) | 4.28 | 4.78 | 4 | 4 | 0 |
| g. long-term family disorder and circumstances (e.g., husband has deserted the family). | 4.94 | 4.92 | 5 | 5 | 0 |
| h. lack of resources in a particular area, such as communication and transportation to hear about or get to a job. | 7.17 | 6.33 | 8 | 7 | +1[e] |
| i. poor welfare and employment laws which encourage dependency. | 7.22 | 6.75 | 9 | 8 | +1 |

[a] T = 2.22; D.F. = 72; Significant at .05 level.
[b] T = 2.52; D.F. = 72; Significant at .02 level.
[c] T = 1.96; D.F. = 71; Significant at .10 level.
[d] T = 1.19; D.F. = 63; Significant at .10 level.
[e] T = 1.95; D.F. = 72; Significant at .10 level.

SCHEDULE D

Ranking of Opinion Statements Before and After (N=36)

3. In most urban communities in the U.S. poverty can best be solved by:

| | Mean Before | Mean After | Rank Before | Rank After | Rank Change |
|---|---|---|---|---|---|
| a. developing better education for deprived children in our school system. | 2.42 | 2.58 | 2 | 2 | 0 |
| b. providing vocational or specialized training for the unemployed. | 2.31 | 1.97 | 1 | 1 | 0 |
| c. denying welfare support to able-bodied breadwinners. | 7.42 | 8.31 | 9 | 9 | 0[a] |
| d. reducing racial prejudice among employers. | 4.50 | 4.33 | 4 | 4 | 0 |
| e. expanding the job market through new private industry in the community. | 3.56 | 4.50 | 3 | 5 | -2[b] |
| f. relocating people to areas of high demand for workers. | 6.28 | 7.08 | 7 | 8 | -1[c] |
| g. exposing youth to successful models from their own group and area. | 5.14 | 5.25 | 5 | 3 | +2 |
| h. expanding the job market through government projects. | 6.28 | 4.67 | 6 | 6 | 0[d] |
| i. reorganizing government agency structures which should handle the problem. | 7.17 | 6.31 | 8 | 7 | +1[e] |

4. In most urban communities in the U.S. the most important obstacle to the solution of the problem of poverty is:

| | | | | | |
|---|---|---|---|---|---|
| a. community apathy -- e.g., it is not a concern of community leadership. | 2.50 | 2.44 | 2 | 2 | 0 |
| b. the lack of understanding -- most people do not realize the extent or nature of poverty in the community. | 2.19 | 1.86 | 1 | 1 | 0 |
| c. the lack of money to support projects designed to reduce poverty. | 5.22 | 6.69 | 4 | 8 | -4[f] |
| d. the lack of expert knowledge about how to change established patterns of behavior, especially for particular ethnic groups. | 3.94 | 4.92 | 3 | 3 | 0[g] |
| e. resistance to change by those satisfied to stay the way they are now. | 5.69 | 6.14 | 6 | 7 | -1 |
| f. the continual movement of poorly prepared rural people to cities with no job market. | 5.39 | 5.00 | 5 | 4 | +1 |
| g. the need of welfare agencies to concentrate efforts on old and disabled persons when real change could come from concentration on youth programs. | 7.06 | 6.81 | 8 | 9 | -1 |
| h. the expectation that people can succeed regardless of their present circumstances. | 5.72 | 5.14 | 7 | 5 | +2 |
| i. obsolete or backward government agency structures. | 7.17 | 6.00 | 9 | 6 | +3[h] |

[a] T = 2.10; D.F. = 51; Significant at .05 level.
[b] T = 1.94; D.F. = 71; Significant at .10 level.
[c] T = 2.21; D.F. = 72; Significant at .05 level.
[d] T = 3.21; D.F. = 66; Significant at .01 level.
[e] T = 1.78; D.F. = 72; Significant at .10 level.
[f] T = 2.76; D.F. = 72; Significant at .01 level.
[g] T = 2.06; D.F. = 66; Significant at .05 level.
[h] T = 2.51; D.F. = 71; Significant at .02 level.

SCHEDULE E

1. <u>What do you feel were the main objectives of the Institute?</u>

The thirty-six participants gave sixty-eight responses to this question. These were broken down into five categories:

(a) The objective is to explore and establish the concept and operations of a Youth Opportunity Center. (11)

. . ."The main objective was to give a broad, general base of knowledge that pertains to probable problems that will come up in Youth Opportunity Center operations."

. . ."The objective was to establish a concept of the Youth Opportunity Centers now in operation; how it is being originated, what type of people work there; what type of youth are being worked with."

(b) The objective was to understand the culture of poverty and the various institutions that may be utilized in the fight against poverty. (28)

. . ."The objective was to make us aware of the problems in poverty and of ways and methods which may be used in solving these problems."

. . ."I feel the main objectives of the Institute were to enable us to understand our clients, to help us discover the new ways of getting things done, and to experience some of the problems of our clients."

. . ."The objective was to develop a different frame of reference in which to view the problems of the disadvantaged youth and to provide information that we may need in dealing with these problems."

(c) The objective was to understand and improve the system within which Employment Service and Youth Opportunity Center personnel operate. Furthermore, we were to understand our role and status in the anti-poverty programs. (21)

. . ."The objective was to create an awareness of our responsibilities and roles."

. . ."The objectives were to establish a clear concept of our own status and what part in fighting poverty we should play, to help us understand the system in which we work, its inadequacies, its structures, and what we can do to improve it to facilitate our cause."

. . ."Although many of us are not managers, it was intended to point out faults in the 'system' and measures available to correct it -- at least to make the system better serve our purposes and goals rather than letting the system dictate what we shall do and how we shall do it."

(d) The objective was to motivate Employment Service and Youth Opportunity Center personnel to perform in a professional manner and to be more creative and goal-oriented. (7)

. . ."The objective was to encourage us to accept our responsibilities and perhaps become professionals."

. . ."The objective was to retrain present and past Employment Service people to become more creative and more concerned with results than records."

(e) "One objective was to gain information for future use in research by the University of Colorado -- to glean from Employment Service personnel their opinions in a protected atmosphere." (1)

2. <u>Were these objectives achieved or not?</u> Yes: 36 No: 0

Three respondents gave no explanation, the remaining thirty-three gave forty-one responses.

(a) Yes, we gained insight into disadvantaged youth and the culture of poverty and, thereby, into means of accomplishing our task. (26)

. . ."Along with most other members of the Institute, I feel I am now better equipped to deal with poverty groups in a more effective and understanding way and will, within the well-known limits, attempt to break out of the system with fresh approaches to help solve current problems."

. . ."The knowledge gained of the 'other America' will provide a basis for providing more meaningful opportunities for those who exist in poverty."

. . ."I feel that I have gained a great deal of insight into the whole operation involved in eliminating poverty and that I have gained ideas and knowledge to assist me in making decisions and establishing a plan of action for accomplishing our task."

. . ."I believe I have gained the material to do a much better job in the Employment Service."

(b) The Institute provided challenges and stimulation to try new techniques and realize our goals in the Employment Service and Youth Opportunity Centers. (5)

. . ."I had not realized to what extent I had become bureau-oriented. I have been inspired to introduce new ideas into our poverty programs."

. . ."The Institute has afforded me many challenges -- some soul searching -- and most of all a new enthusiasm to go home and try out new techniques and ideas in the training of people in our Employment Service and Youth Opportunity Center offices."

. . ."When I came here, I was not sure I wanted to have anything to do with that crazy bunch in the Youth Opportunity Center office. Now I wish to go over there and tell them how to get going."

(c) Yes, but results obtained while on the job will be the ultimate criterion. (2)

. . ."However, the real achievement will come when we put what we have learned into action in our own offices."

. . ."The objectives were probably achieved, but what actually happens will be a much better criterion."

(d) Miscellaneous responses. (8)

. . ."I feel the caliber and wide scope of instructors and field observations served very well in creating an awareness of the various aspects of Youth Opportunity Center management and operation."

. . ."Yes, although I would have liked to have had more time in the development of specific skills such as socio-drama techniques and counselling. Also, some smaller group work might have been quite helpful."

3. <u>Do you feel that your own commitment to work in Youth Opportunity Programs has increased, decreased, or remained unchanged?</u>

Increased: 34 Unchanged: 2 Decreased: 0

(a) Now that I understand the background of disadvantaged youth, I want to contribute to the solution of the problems. Further exposure to new ideas and techniques will aid me in my endeavor. (22)

. . ."I now understand the background and want to try to make my small dent in improving youth."

. . ."I now have a much broader understanding of the problems and people involved, and I realize that the Youth Opportunity Center can do a tremendous job for these people provided we are committed to a total effort."

. . ."The program gave me a chance to see what is being done in other areas and it brought up the many things that need to be done."

(b) Although I do not work directly in a Youth Opportunity Center, I do feel more committed to the youth I work with in the schools. (4)

. . ."I am not in a Youth Opportunity Center, but I feel in my program involving youth and others thrust into poverty that my commitment has definitely increased."

. . ."Although I do not work in a Youth Opportunity Center, I feel more responsibility to the youth I do work with in the schools and I would like to see a more effective program enacted there."

(c) Other explanations from respondents whose commitment increased:

. . ."I feel that the Youth Opportunity Center should be the central organization for all programs designed to assist youth. The idea of crash-type programs has not succeeded because there is no plan of action designed to follow up on these youth after the crash programs have ended." (2)

. . ."The offices I supervise will get a push to provide better youth services. I am going to call a managers' meeting and give them the word." (2)

. . ."To see what other people are doing was indeed an incentive to try to do as well or better. The enthusiasm of many of these people showed that they really feel strongly about their work." (2)

(d) Respondents whose commitment remained unchanged: (2)

. . ."Remained unchanged. I have always felt that our responsibility was to everyone. A greater amount of energy must be focused on the greatest need."

. . ."Remained unchanged since I have not been ordered to work in a Youth Opportunity Center. Although I do not believe a Youth Opportunity Center operation to be efficient, I am confident that I could make a success of one if I had to."

4. I liked the food. Yes: 22 No: 14

5. Announcements and directions were clear and easy to follow. Yes: 36 No: 0

6. There should have been more time for recreation. Yes: 23 No: 12 No Answer: 1

7. When you first came to the Institute, did you have well-formulated learning objectives?

Yes: 10 No: 26

Three respondents who gave negative answers claimed insufficient notice of the Institute and its purposes. The ten respondents who gave affirmative answers listed the following learning objectives:

. . .To organize the function of counselors under this program.

. . .Management techniques

. . .To learn more about the culture of poverty.

. . .To learn as many new thoughts and techniques relevant to my work as possible during a three-week program. (3)

. . .Programs and activities of other Youth Opportunity Centers

. . .Awareness of the feelings of impoverished people

. . .Graduate-level study in sociology

. . .To resist being brainwashed toward the destruction of our way of life.

. . .I thought I had, but now I see the need for speed-reading and the use of a tape recorder.

8. I could have participated more actively. Yes: 28 No: 8

9. Having senior administrators present was a great assistance. Yes: 25 No: 9 Indifferent: 2

10. I would like to have had more time spent in:

| | |
|---|---|
| management (5) | sociology and psychology of poverty (2) |
| field observations (5) | job development (1) |
| relaxation (4) | MDTA and Job Corps (1) |
| YOC operation (3) | economics (1) |
| participating with welfare and community agencies (3) | program evaluation (1) |
| socio-drama (3) | group discussions (1) |
| counseling (2) | individual activities (1) |
| | no answer (3) |

11. In the total picture, I think everyone accepted everyone else and made them feel comfortable.

Yes: 36 No: 0

12. There was too much time pressure. Yes: 12 No: 23 No Answer: 1

13. Most people in the group changed their attitudes and behavior and became more knowledgeable during the Institute.

Yes: 35 No: 1

14. I learned many things which will be helpful in my work relationships with disadvantaged youth.

Yes: 36 No: 0

Also fellow employees. Yes: 35 No: 0 No Answer: 1

15. My most significant learning occurred during, or as a result of:

(a) lecture sessions (24)
(b) evening discussion sessions (3)
(c) informal discussions with other participants (12)
(d) field observations (23)
(e) demonstrations with basic instructors (10)
(f) others (2)
. . ."the total program"
. . ."investigation of Larimer and Curtis Streets on my own time"

16. Discussion with other participants outside the formal groups was beneficial to me. Yes: 36 No: 0

17. There should have been more planned recreation. Yes: 13 No: 23

18. The Institute faculty was well chosen for the job. Yes: 34 No: 2

Twenty-three respondents commented on this question as follows:

. . .The faculty did an excellent job.(8)
. . .The faculty, generally, was good, although a couple of the speakers were inadequate and/or redundant. (5)
. . .Too much time was devoted to certain areas and/or speakers; there could have been greater variety in the program. (2)
. . .The staff did an excellent job. (2)
. . .I think we received a well-rounded program. (1)
. . .Yes, but they were a little too authoritarian. (1)
. . .Yes, but it was noticeably loaded with socialist-like people. (1)
. . .Generally, the second presentation given by a speaker was not as good as the first. (1)
. . .No, only for observation purposes. (1)
. . .No, I don't see the justification for the location as the only contact with the area was through two field trips. (1)

19. Too much time was spent in:

role playing (6)
basic instructors (5)
repetitious or irrelevant lectures (4)
classroom activities (3)
night sessions (2)
bureaucratic static (1)
problems of the Denver area (1)
minority group leaders as speakers (1)
preparation of ditto material (1)
court appearance (1)
lectures (1)
defensive behavior (1)
drinking (1)
no answer (10)

20. The pressure of time was conducive to the learning situation. Yes: 18 No: 16 No Answer: 2

21. People improved their awareness of the problems of disadvantaged youth. Yes: 35 No: 1

22. There was enough time to discuss with others outside of formal groups. Yes: 33 No: 3

23. I think I gained knowledge but without much change in my attitude or behavior. Yes: 9 No: 27

24. Most of my learning resulted from:

lectures (20)
field work and trips (16)
discussion groups (12)
basic instructors (9)
films (1)
listening (1)
direct experience and factual information (1)
understanding the culture of poverty (1)
cognitive processes of the intellect (1)
the cumulative effect of the program (1)
no answer (1)

25. Inadequate use was made of:

the intelligence and experience of the participants (3)
the better lecturers such as Hollander, Sanfilippo, Zubrow, and Higman (3)
visual aids, movies, and slides (3)

free time, e.g., to review and assimilate material (2)
reference books and handouts (1)
relevant social agencies (1)
time -- there was too much repetition on some subjects (1)
the YOC -- I would have preferred more time to investigate it (2)
the ventilation and tables in the classroom could have been improved upon (1)
Schwartz and Quicker as instructors (1)
no answer (18)

26. The Institute started a change in my attitude toward others. Yes: 30 No: 6

27. If I were to plan another such Institute, I would give more time to:

(a) lecture sessions (10)
(b) evening discussion sessions (3)
(c) informal discussion (12)
(d) field observations (20)
(e) demonstrations with basic instructors (8)
(f) other (6)
. . .the good lecturers (1)
. . .field trips to the Employment Service and the YOC (2)
. . .free time, especially during the evening (2)
. . .films for the evening sessions (1)

28. Were the physical facilities satisfactory? If no, why not? Yes: 21 No: 15

Six respondents who answered "yes" added qualifying comments. Several participants gave multiple responses. Thus, there are twenty-five explanatory responses:

. . .The classroom ventilation was inadequate. (12)
. . .More vehicles were needed for field trip transportation. (2)
. . .The classroom chairs were uncomfortable and the arrangement of them was not conducive to group interaction. (2)
. . .Often the classroom was not well cleaned. (2)
. . .A larger classroom was needed. (2)
. . .The hotel accommodations were inadequate. (2)
. . .The location was not necessary to the instruction. I feel we would have done better at the University of Colorado campus, coming into Denver for field trips. (2)
. . .The classroom should have a raised lecture platform. (1)

29. I participated in all activities as well as I could have. Yes: 20 No: 16

30. I felt more "take home" material could have been given in the Institute. Yes: 9 No: 27

31. The various parts of the Institute seemed related to each other. Yes: 34 No: 2

32. I would like to attend a more advanced Institute of this type. Yes: 29 No: 6 Undecided: 1

33. To improve future Institutes I would suggest:

. . .More free time -- weekends or evenings would be preferred. Possibly the Institute could be lengthened, thereby allowing for strictly daytime programming. Free time could be used for recreation, relaxation, or study. (13)
. . .The classroom could be more spacious and better ventilated. (5)
. . .The food could be improved upon. (5)
. . .More time should be spent on aspects of management and theories of counseling. Possibly this could be done by dividing the participants into two homogeneous groups: managers and counselors. (3)
. . .The living accommodations could be better. (2)
. . .I would suggest more programs involving agency personnel like the one spent with the welfare workers. (2)
. . .Additional use of films and other visual aids would be helpful. (2)
. . .Relevant books and articles should be sent to the participants prior to the Institute. (1)
. . .More managers of agencies should attend the Institute. (1)
. . .More time should be spent on job development for youth. (1)
. . .Basic instructors should be utilized in less structured situations. (1)
. . .There should be more hand-out material, field visits, demonstrations, and role-playing. (1)

34. I think the most helpful thing for me to continue my training would be:

. . .Most useful to me will be the chance to implement what I have learned through continuing field experience in programs designed for disadvantaged youth. (10)

. . .My training will be continued best by pursuing an advanced degree or graduate course in sociology, psychology, or economics. (9)

. . .To receive and study relevant literature on management, disadvantaged youth, and Youth Opportunity Centers would be of help in continuing my training. (8)

. . .It would be helpful for the same students and staff to meet several months hence to receive more recent information and exchange relevant experiences. (5)

. . .Further training in counseling skills would be most helpful. (4)

. . .Continued participation in courses and institutes such as this one would be most beneficial. (2)

. . .Assistance in working with members of the community would be most helpful. (1)

. . .An interchange of ideas and information with others sharing my problems would be very helpful. (1)

## SECTION II

## DIFFERENTIAL EFFECTS OF THE COLORADO SCHOOL

Human beings respond in different ways to the information they receive through their senses, and the Employment Service Personnel who participated in the Colorado school were no exception. Lectures, demonstrations, and field observations that were greeted with enthusiasm and appreciation by some were found to be boring and, in some cases, infuriating by others. Each participant in the program was a unique person with a set of unique experiences in the world in which he lives. Yet, each also shared certain general characteristics with others. For the purposes of the training program staff, differential responses which can be associated with shared characteristics are particularly important. Such responses provide cues for the analysis and evaluation of training content and methods which can be used to improve and refine the educational impact of short-term intensive training.

The research staff used the brief biographical sketches supplied by the participants to establish a number of different categories into which the group could be divided, such as age, sex, length of employment with the Employment Service, educational background, and so on. The categories which were formulated and the way in which the group was distributed in these categories are shown below:

Group Characteristics (N = 36)

Age

| 20-29 | 30-39 | 40-49 | 50 + |
|---|---|---|---|
| 7 | 10 | 12 | 7 |

Sex

| Male | Female |
|---|---|
| 30 | 6 |

Position with Employment Service

| Counselor, Aide, or Trainee | Specialist, Manager, or Supervisor |
|---|---|
| 18 | 18 |

Length of Time with the Employment Service

| Less than 1 yr | 1-4 yrs | 5-9 yrs | 10-19 yrs | 20 yrs or more |
|---|---|---|---|---|
| 4 | 11 | 9 | 9 | 3 |

Size of City where employed

| Less than 50,000 | More than 50,000 |
|---|---|
| 15 | 21 |

Participants by state

| Colorado | Montana | Oregon | Utah | Washington | Wyoming |
|---|---|---|---|---|---|
| 12 | 2 | 3 | 6 | 4 | 9 |

Kind of work with Employment Service

| Now Assigned in a Youth Opportunity Center | Not Now Assigned in a Youth Opportunity Center |
|---|---|
| 16 | 20 |

Supervisory Responsibility

| Have no Subordinates | Two or more Subordinates |
|---|---|
| 22 | 14 |

Educational Background

| High School and Some College | College Graduate | Some Graduate Work | Graduate Degree |
|---|---|---|---|
| 13 | 8 | 11 | 4 |

Previous Work History Kind of Employment Dominant

| No Previous Work History | Educational Fields | Business, Sales Services |
|---|---|---|
| 3 | 10 | 23 |

Previous Work History Economic Sector Dominant Employment

| No Previous Work History | Public Sector (state, federal, etc) | Private Sector (business) |
|---|---|---|
| 3 | 17 | 16 |

Previous Work History Managerial Experience

| No Previous Work History | No Managerial Experience | Managerial Experience |
|---|---|---|
| 3 | 14 | 19 |

Type of education

| Hard | Soft | Unclassified |
|---|---|---|
| 20 | 10 | 6 |

Type of education

| Cosmopolitan | Non-Cosmopolitan | Unclassified |
|---|---|---|
| 11 | 19 | 6 |

With the exception of "hard" and "soft" education and the "cosmopolitan" (cosmo) and "non-cosmopolitan" education categories, each of the above participant population breakdowns is self-explanatory. "Hard" and "soft" refer to the course content that the participant studied in college or post high school education. If the participant indicated that his major course content was in business, engineering, or the physical sciences, he was placed in the "hard" education category. If his curriculum was in education, art, English literature, social science, or related fields, he was designated in the "soft" education classification. "Cosmo" and "non-cosmo" refer to the size of the post high school educational institution attended and the composition of the student body. If the participant attended a large school with a diverse student population, he was listed in the "cosmo" category. If he attended a small school, he was shown in the other category.

As is obvious to the reader, although the population breakdown shown above is systematic, it is also arbitrary. Any number of different categories could have been utilized. The purpose of separating the participants into different discrete groups based on their background characteristics was simply to see if any of these characteristics were related to the way in which participants responded to the training program. The use of the breakdown is demonstrated in the analysis of participant response to questionnaire schedules F and H which appear on pages 94 through 95.

SCHEDULES F and H

In order to evaluate the impact of training programs upon trainees, it is helpful to distinguish them by what they say about their reasons for working in the Youth Opportunity Center Program. It is assumed that persons participating in the Program for different reasons would as a matter of course seek and respond to different aspects of a training program. Moreover, it is of value to have an understanding of those motivational factors that lead to occupational choices.

In this section we attempt to arrive at an understanding of the trainees in terms of two variables: motivation and attitudes toward personality change.[1] Each variable is treated separately; each, however, is subjected to the same analytic procedure.

Schedule H was designed to measure motivation. Trainees were asked to check each of a series of twenty-one items that were constructed as "reasons for an Employment Service person to work in the Youth Opportunity Center Program." More than one such reason could be checked.

To facilitate our analysis of the trainees' responses to this instrument, we developed a series of analytic categories called clusters.[2] Cluster analysis serves to simplify the analytical task since it enables us to organize many items into a few categories. Many items, apparently disparate, may tap the same dimension and consequently fall into the same cluster. The resulting clusters are motivational clusters, or reasons for working in the YOC, that appear to be related to each other. The relations among items are measured by a coefficient of correlation. Briefly, a cluster is composed of items that show a high interrelationship to one another. Each item is more highly associated with items within the cluster than with items outside the cluster.[3]

After developing clusters, we can examine them with respect to the relevant background characteristics of trainees whose responses indicate that they belong to one or another of the cluster. The aim here is to uncover the specific areas of appeal that the YOC makes for each of the specifically motiviated groups.

The analysis of the motivational instrument generated six motivational clusters.[4] Each cluster in turn is labelled in terms of the content of the items that compose it. The respondents are then categorized in terms of their membership in the cluster.[5] Finally, the demographic characteristics of cluster members are described.

Table I shows the details of the cluster analysis. The encircled items belong to the same cluster. Within each circle the average measure of correlation between each item and the cluster appears. Continuing across the table horizontally we next see the average measures of correlation of each item with the remaining cluster. For example, item two: its average relationship to items within its own cluster (Cluster A) is .8276, while its average relationship to Clusters B, C, D, E, F, is respectively .1257, .0334, .0616, .2486, .1204. Cluster analysis stipulates that an item should show its highest relationship within its own cluster. As the discussion of item two shows, this is the case. An inspection of the table for every other item is done by reading across the rows. In such fashion we are able to ascertain whether or not each item shows a higher correlation within its assigned cluster than to any other cluster. Each cluster may also be examined. By reading down the columns, the correlation of each item to that cluster is found. We would expect no relationship outside of the encircled items to be higher than the relationship within the cluster.[6]

Next we examine the content of each cluster for a clue to its meaning.

<u>Cluster A -- "Adventure"</u>

9. chance to do something different
18. chance to get away from dull routine
8. chance to meet different kinds of people
16. opportunity to meet persons with similar interests.

---

[1]See Schedule H and Schedule F on pages 95 and 94.

[2]Robert C. Tryon, <u>Cluster Analysis</u>, Ann Arbor, Michigan: Edwards Bros., 1939.

[3]Technical details and correlation charts appear below.

[4]The computer program used was the BC Try System (developed by Robt. Tryon, Dept. of Psyc.,U. of Calif,Berkeley,1964)

[5]The criterion for membership in a cluster is satisfied by the respondent's checking "yes" to a majority of items in that cluster.

[6]There are some exceptions; for example, items that appear in more than one cluster.

TABLE I

| | Items | A | B | C | D | E | F |
|---|---|---|---|---|---|---|---|
| I | | | | | | | |
| Adventure | 9 | .8276 | .1257 | .0334 | .0616 | .2486 | .1204 |

| Career | | .0525 | .0732 | .0673 | .4465 | .1822 | .5953 |
| Factor | 18 | .7934 | .0542 | .1503 | .0578 | .2082 | .1857 |
| | 8 | .6589 | .0057 | .1442 | .1528 | .1053 | .3563 |
| | 4 | .0673 | .0127 | .0342 | .6273 | .0998 | .3952 |
| | | .5111 | .5555 | .2316 | .3509 | .2429 | .1468 |

Cluster A composed of four items was labelled "Adventure." The items in Cluster A emphasize the new and the different with respect to persons and activities.

Cluster B -- "Organization Man"

11. work for an organization that has a good reputation
15. working conditions are good

Cluster B was labelled "Organization Man." While only two items compose Cluster B, the theme is clear: a focus upon the characteristics of the organization. While Cluster A stresses the opportunities provided by the organizational structure for action, Cluster B centers upon what may be known about the reputation of the organization.

Cluster C -- "Organization Man II"

11. work for an organization that has a good reputation
15. working conditions are good
19. less red tape
13. the morale is good

Items eleven and fifteen placed in two clusters, both of which stress characteristics of the organization. Cluster C, however, incorporates two additional items: "good morale" and the lack of "red tape." Because of the similarity, Cluster C was labelled "Organization Man II."

Cluster D -- "Public Interest"

2. help less fortunate persons
7. find solutions to contemporary problems
5. opportunity to take part in social experiment
4. opportunity to contribute to the community

Cluster D, composed of four items, was labelled "Public Interest." The items stress social welfare and the perceived opportunity to accomplish good deeds. While previous clusters stressed the attributes of the organization itself and the opportunities the organization provides for adventure, Cluster D clearly

focuses upon the organization as a vehicle facilitating contributions to public welfare.

Cluster E -- "Compatability"

17. opportunity to work with persons of similar interests
16. opportunity to meet persons with similar interests
18. chance to get away from dull routine

In so far as the property of the operations performed on the data in a cluster analysis provide us with the strongest cluster of items first and subsequently a less highly-intercorrelated cluster as the items are re-manipulated, it may be expected that the later clusters generated by the analysis are less internally consistent than earlier ones. Consequently, the interpretation of Cluster E is less than perfectly clear.

Two of the items (item 16 and item 17) reflect the theme of compatability. The organization is seen providing both the opportunities to work and meet persons with similar interests. Interpreting item 18 in this thematic context seems to indicate that the "dull routine" might be made so by the lack of compatible co-workers. Leaving the "dull routine for the possibility of developing a more compatible environment is taken as the theme expressed in item 18. Consequently, Cluster E was labelled "compatability."

Cluster F -- "Career"

6. good salary
18. chance to get away from dull routine
8. chance to meet different kinds of people
4. opportunity to contribute to the community

The final cluster, Cluster F, composed of four items containing a variety of themes, was labelled "Career." Cluster F contains items reflecting practical considerations such as pay, doing good works, and adventure.

The analysis generated six clusters each of which has been analyzed for its unique theme expressed by the items that compose it. The content of each cluster demonstrates a certain consistency and each cluster rests upon a solid statistical base.

We may now examine each cluster for its membership and compare those respondents who belong to the cluster with those who do not. Membership in a cluster is based upon the proportion of items in the cluster to which a respondent replied positively. For example, those respondents who checked any three of the four items in Cluster A are defined as members of the cluster. A profile of each cluster will be presented. This profile is expressed in terms of relevant socio-economic factors of the members of the cluster. In those cases where membership or nonmembership in the cluster is undistinguished by the socio-economic characteristics of the respondents, a discussion of that particular socio-economic factor is omitted.[7]

"Adventure." There is a slight inverse relationship between age and membership in "adventure." While .59 of persons under forty years fall within the cluster, .63 of persons over forty fall outside of the cluster. Males and females are equally represented as are persons categorized by occupation. Partialling the sample by number of years employed in the Employment Service shows that persons employed for less than four years are about evenly distributed in and out of the cluster. For persons in the Service for over four years, however, there appears a slight tendency for them to be underrepresented in this cluster (.42). Examining the origin state of the sample, we find Colorado and Montana each evenly divided between membership and nonmembership, Utah respondents disproportionally (.83) belonging to the cluster, while Washington and Wyoming disproportionally outside of the cluster (.75 and .66 respectively). Working in YOC is unrelated to membership. Persons with a college education or better are evenly divided between membership and nonmembership. Persons with only a high school education are slightly underrepresented in the cluster (.38). While only .40 of the sample reporting "hard education" belong to the cluster, .70 of those reporting "soft education" belong. Utilizing the classification "cosmo," we discover .59 of the "cosmos" in the cluster but only .36 of the "non-cosmos." Previous work history in education or business did not distinguish membership in the cluster.

"Public Interest." Persons under forty years old are slightly better represented (.59) than persons over forty (.45). Sex appears to be associated with membership in "Public Interest" as .67 of the males and .50 of the females belong. Neither reported city size nor time in the Employment Service appear to be related to membership. Working in the YOC, however, does differentiate among trainees and membership in the cluster, .81 and .50 reporting yes and no respectively. There is a slight difference in persons reporting no subordinates (.60) and those who do report subordinates (.69). Education is related to "Public Interest" with .53 persons reporting less than a college degree composing membership and .69 of the persons reporting a college degree or better belonging to it. While only .50 of those reporting "soft" education in the cluster, .70 of those reporting "hard" education belong. We note that .36 of the "cosmos" and .69 of the "non-cosmos" fall into the cluster. There is a slight tendency for persons reporting business background to be better represented in the cluster than reporting an education background, .69 and 60 respectively.

---

[7]In the following descriptions of the background of members of clusters, the demographic materials used may be found on pages 87 and 88.

Cluster B

11. self-confidence
6. loyalty
8. creativeness

Cluster B was composed of three items. It should be noted that this cluster is based not upon checks by the respondents as "easy to change," but as difficult to change. Only two persons checked these items as "easy" items. Consequently, the correlation is based upon the fact that the majority of respondents did not check the items. The items cluster nonetheless in terms of perceived difficulty.

Cluster C

17. cleanliness
2. punctuality

Cluster C was composed of two characteristics the respondents felt easily changed. Both items reflect middle-class standards and are obviously directed toward getting along in the world.

Cluster D

12. aggressiveness
13. mode of dress

The two items composing Cluster D were inversely related. While mode of dress is perceived as "easy to change," aggressiveness is difficult. The fact of their clustering together, albeit inversely, suggests that the respondents tie them together in a systematic fashion.

Cluster E

7. respectfulness
16. intelligence quotient

As in Cluster D, the two items composing Cluster E were inversely related. Just as respectfulness is seen as "easy to change," so is IQ seen as "difficult to change."

Cluster F

5. courtesy
14. motivation
6. loyalty

Three items composed Cluster F. As Table II shows the relationship among the items is weak. It was noted above that the weakest relationships occur in the later clusters.

In so far as so many inverse relationships turned up in the anlysis of the characteristics instrument making it difficult to assign membership to these clusters, only in two cases were demographic background factors run against cluster membership.

"Cluster B". Persons over forty years old are slightly better represented in this cluster than persons under forty, .59 and .79 respectively. Approximately two-thirds of both male and female respondents fall into this cluster. Time in the Employment Service seems to make a difference: .76 of the respondents in the Service for four years or more belong to the cluster, while .60 of those with less than four years' service belong. Both the group working in the YOC and those not working in the YOC are approximately equally represented in the cluster. Having subordinates does not appear to be related to membership. Education, however, appears to be negatively associated with membership with .85 of those with less than a college degree falling into the cluster and only .61 with a degree or more belonging. Utilizing the classification "cosmo" we find that .69 of the "cosmos" are in the cluster compared with .57 of the "non-cosmos."

"Cluster E." Age does not distinguish membership in Cluster E. Males appear to be underrepresented .23 to .50 for females. Time in the Employment Service is related to membership in the cluster. There is a slight tendency for persons with less than four years service to be better represented than those with more than four years' service, .33 and .24 respectively. Persons presently working in the YOC are disproportionally represented in the cluster, .44 compared to .15 for those not so occupied. Having subordinates appears to be inversely related to membership. We note that .40 of those reporting no subordinates are members of the cluster, while .12 of those reporting subordinates belong. We find that .70 of those respondents reporting a "hard" education belong to the cluster and only .10 of those reporting a "soft" education. Finally, previous work history is associated with membership in the cluster: .60 of those respondents reporting education background compared with .13 of those reporting a business background in the cluster.

"Compatability." Age is related to membership with .35 of persons under forty and .21 over forty falling into the cluster. Males are slightly overrepresented with .30 compared with .17 of the females. While .22 of the trainee-counselors form the cluster, .33 of the specialists do so. City size seems to be related to membership: .19 of those from cities less than 50,000 from the cluster compared with .33 from cities over 50,000. Persons with less than four years in the Employment Service are slightly better represented (.40) than those with more than four years (.19). Working in YOC appears to be related to membership: .37 reporting working in the YOC are members compared to .20 not working in the YOC. Persons with a college degree or better are slightly better represented than those with less than a college degree, .43 and .23 respectively. "Hard" or "soft" education is not related to membership in this cluster. While .36 of the "cosmos" fall into the cluster, only .25 of the "non-cosmos" belong. Previous work history is related to membership: .17 reporting business experience compared to .50 reporting educational background.

"Career." There is a slight tendency for persons under forty to be better represented than persons over forty, .35 and .21 respectively. Sex is apparently related to membership with .82 of the males in the cluster and only .20 of the females. City size is associated with membership as .33 of the respondents from cities less than 50,000 and .24 from cities over 50,000 are in the cluster. Time in the Employment Service bears the same relationship: persons with less than four years service are slightly better represented (.33) than those with more than four years service (.24). While .12 of those working in the YOC compose the cluster, .40 not working for the YOC belong. Persons having subordinates are slightly better represented in the cluster than those reporting no subordinates, .25 and .20 respectively. Persons with a college degree or better are more likely to belong to this cluster than those with less than a college degree, .39 and .08 respectively. While .40 reporting "soft" education compose the cluster, only .30 of those reporting a "hard" education belong. "Cosmos"(.38) are slightly better represented than "non-cosmos" (.29). Persons with an education work history are slightly better represented in the cluster (.30) than persons reporting a business background (.21).

In addition to analyzing what respondents say about their reasons for working in the Youth Opportunity Center program, it is of interest to investigate what characteristics of persons they think are most easily changed. Schedule F was designed to illicit this information. Respondents were presented with a checklist composed of eighteen items listed as characteristics of high school dropouts. They were instructed as follows: "Some (characteristics) are easy to change, some are difficult to change. Please place a check in front of those characteristics which you believe are easiest to change."

Once again the results were analyzed for clustering. In this case, clusters of personality characteristics of high school dropouts were used. Table II shows the cluster analysis data.

TABLE II

| | A | B | C | D | E |
|---|---|---|---|---|---|
| 11 | .7832 | .0333 | .0681 | .0896 | .0089 |
| 6 | .5178 | .1027 | .2708 | .0178 | .2413 |
| 8 | .7832 | .1360 | .2889 | .0718 | .2502 |
| 17 | .1273 | .6473 | .0346 | .3339 | .1618 |
| 2 | .1120 | .6417 | .0346 | .3339 | .1618 |
| 12 | .0162 | .0424 | .6117 | .1209 | .0910 |
| 13 | .2284 | .0969 | .4730 | .1209 | .0910 |
| 7 | .0045 | .3671 | .0113 | .6139 | .0175 |

| 5 | .1483 | .1488 | .0435 | .2559 | .5116 |
| 14 | .2047 | .0608 | .0432 | .3356 | .3834 |
| 6 | .5178 | .1027 | .2208 | .0178 | .2413 |
| | 14827 | .4153 | .2941 | .3408 | .1435 |

Name _____ Schedule F

UNIVERSITY OF COLORADO
EMPLOYMENT SECURITY INSTITUTE
ON THE MANAGEMENT AND OPERATION OF YOUTH OPPORTUNITY CENTERS

1. The following are characteristics of high school dropouts. Some are easy to change, some are difficult to change. Please place a check ( ) in front of those characteristics which you believe are easiest to change.

1. _____ reliability
2. _____ punctuality
3. _____ honesty
4. _____ perserverence
5. _____ courtesy
6. _____ loyality
7. _____ respectfulness
8. _____ creativeness
9. _____ cooperativeness
10. _____ conformity
11. _____ self-confidence
12. _____ aggressiveness
13. _____ mode of dress
14. _____ motivation
15. _____ competence
16. _____ intelligence quotient (IQ)
17. _____ cleanliness
18. _____ willingness

Name _____ Schedule H

UNIVERSITY OF COLORADO
EMPLOYMENT SECURITY INSTITUTE
ON THE MANAGEMENT AND OPERATION OF YOUTH OPPORTUNITY CENTERS

1. Which of the following do you think important as reasons for an Employment Service person to work in the Youth Opportunity Center program. Check as many reasons as you think applicable.

_____ 1. gain insight into self and others.

_____ 2. help less fortunate persons.

_____ 3. a continuous learning situation.

_____ 4. opportunity to contribute to the community.

_____ 5. opportunity to take part in social experiments.

_____ 6. good salary.

_____ 7. find solutions to contemporary problems.

_____ 8. chance to meet different kinds of people.

_____ 9. chance to do something different.

_____ 10. security.

_____ 11. work for an organization that has a good reputation.

_____ 12. the opportunity to accept greater responsibility.

_____ 13. the morale is good.

_____ 14. chance to express personal ideals.

_____ 15. working conditions are good.

_____ 16. opportunity to meet persons with similar interests.

_____ 17. opportunity to work with persons with similar interests.

_____ 18. chance to get away from dull routine.

_____ 19. less red tape.

_____ 20. opportunities for promotion.

_____ 21. Other. Please specify: _____

2. Are you currently employed in a Youth Opportunity Center? Yes _____ No _____

Both Schedules A and B were designed to obtain opinion information from participants in the University of Colorado Employment Security Institute II. The instruments were not considered finished products, but rather were tentative or explorational. We wished to see if any patterns concerning successful and unsuccessful counselees and effective and ineffective counselors could be found.

The two questions which comprised Schedule A were:

(1) Thinking in terms of all high school dropouts you have known, will you please describe the typical dropout with whom the Youth Opportunity Center has the best chance for success; please describe this person in detail.

(2) Please describe the typical dropout with whom the Youth Opportunity Center has the worst chance for success.

The answers to these questions were subjected to content analysis. Two members of the research staff read the response of each participant to the questions taking one question at a time. The unit of analysis was each major idea expressed by the participant. Some ideas required only a phrase or sentence fragment; other ideas required several sentences for their expression. The ideas of all participants composed a list from which it was possible to segregate related kinds of ideas into categories. The two researchers developed the categories independently and then compared their results. When there were differences between the two, they were discussed until agreement was reached.

In the case of Schedule A six major categories were derived from the participants' responses. Each category was labelled on the basis of what the research staff considered common sense descriptions implied by the responses within the category. The categories and sample responses are listed below:

I. Maturity and Experience
- a certain amount of formal high school training
- realizes limitations
- can relate self to present and future
- older in age
- some idea of what it is he wants from life
- some work experience
- being married is a maturation device
- some knowledge of "world of work" is helpful
- should be realistic
- some training in various trades necessary

II. Socio-environmental
- should respect community mores
- have had no trouble with police
- have one or more interested parents or authority figures
- have had no disciplinary problems in school
- left school for financial reasons
- has need for support from "significant others"
- greatest proportion of family income is from labor
- has good home environment
- is a bilingual person
- is not a member of a minority group
- comes from a middle-class family
- must have someone to identify with

III. "Boy Scout virtues"
- is sincere
- has good moral standards
- has pride in earning own money
- is alert
- is ambitious
- is motivated
- has belief in God and the Ten Commandments
- has neat appearance
- has self-confidence
- has had military training
- enjoys working
- is trustworthy
- is responsible
- is responsive

IV. Affirmative Psychological Attributes
- self-respect can be developed
- has aptitude and potential for developing skills
- has better than average intelligence
- has no mental handicaps
- has no extreme (disturbed) behavior
- has emotional stability
- has interests (hobbies, sports, etc.) which can be developed
- has well integrated personality
- has self-confidence
- has ability to keep up with peers

V. Success Orientation
- has a desire to learn
- is willing to work
- has a desire to better one's self
- is able to see practical aspects of education
- realizes importance of training
- is able to see that present life is not conducive to success
- has ability to acquire skills
- is willing to take advantage of opportunity
- does not feel world owes him a living

VI. "Middle Classness"
- is socially well adjusted
- is able to respond to guidance, counseling, and training
- appreciates assistance of others
- voluntarily approached YOC
- has a satisfactory school record
- is able to communicate (read, write, verbalize)
- has been out of school long enough to realize harmful implications
- has the ability to adjust
- has not rejected all authority figures
- has initiative, drive, and definite goals

Following this classification, each questionnaire was read again and each major idea was classified according to the category it best fit. Then the responses for each category were tabulated and percentages were calculated. The results of this effort for Schedule A are shown in Tables III and IV.

Table III

Typical Dropout Youth with whom
YOC has Best Chance for Success

| Category Name (Presence of Attributes) | Before Response | After Response |
|---|---|---|
| Maturity and Experience | 16.4% | 13.4% |
| Socio-Environmental | 27.4% | 24.7% |
| "Boy Scout Virtues" | 10.2% | 6.9% |
| Affirmative Psychological Attributes | 15.0% | 15.6% |
| Success Orientation | 11.5% | 10.8% |
| "Middle Classness" | 20.4% | 28.5% |
| Total Number of Responses | 226 | 186 |

Table IV

Typical Dropout Youth with whom
YOC has Worst Chance for Success

| Category Name (Absence of Attributes) | Before Response | After Response |
|---|---|---|
| Maturity and Experience | 10.5% | 7.4% |
| Socio-Environmental | 40.2% | 42.6% |
| "Boy Scout Virtues" | 3.3% | 4.7% |
| Affirmative Psychological Attributes | 18.8% | 19.5% |
| Success Orientation | 8.4% | 6.3% |
| "Middle Classness" | 18.8% | 19.5% |
| Total Number of Responses | 239 | 180 |

Interpretation. Based on the response of the participants, we may make a generalization. The dropout youth with whom we will have the best chance of success will be (I) older with some work experience, which gives him an idea of how tough the world is; (II) will have a general respect for the law, come from a home with a good mother figure and a good father figure, will be white and Anglo Saxon, and will have no police record; (III) will be sincere, honest, respectful, responsible, ambitious, punctual, and neat; (IV) will have normal or higher than normal intelligence, will be emotionally stable, and have a healthy self-image and self-confidence; (V) will be strongly motivated to better himself with hard work and additional education; and (VI) will relate well with the Employment Service counselor who serves him.

The youth with the worst chance for success will have characteristics which are the opposite of all those listed above.

The percentages change very little on the before and after responses which supports the notion that the ideas are relatively firm. We believe that the reader will agree that the enumerated attributes do describe the ideal youth for whom the YOC can be sure of success. In fact, the only strike such a youth has against him is that he has failed to complete school. Such a youth is not likely to appear at the Youth Opportunity Center. Should he appear, if he doesn't receive a job in two days, he will probably obtain a placement on his own initiative.

On the other hand, one of the major (if not the major) populations to be served by the YOC has, on the basis of the described attributes, the worst chance for success.

It is probable that most of the characteristics described tell us as much about YOC counselors as they do about youth they serve. The counselor with his middle-class background will feel more comfortable and secure in serving a middle-class youth than those from a completely different background.

This schedule and its results will require more analysis and thought before its full meaning can be determined. However, the classification indicates clearly the areas that must be covered in any training program designed to prepare Employment Service Counselors to work with poverty youth.

Schedule B also consisted of two open-ended questions:

(1) Thinking of the best youth counselor you have known, please describe the characteristics which you believe have made him successful in helping high school dropout youth.

(2) Thinking of the worst youth counselor you have known, please describe the characteristics which you believe hindered him most in helping high school dropout youth.

The same content analysis procedure was used to obtain categories and tabulate results as was used for Schedule A. The categories and sample items derived from this schedule are:

I. "Boy Scout Virtues"
- has a sincere interest in the youth
- is neat in appearance
- is patient with clients
- is dedicated and loyal
- is always courteous
- is a well-adjusted, emotionally stable person
- has an interest in his job and shows enthusiasm for it
- is intelligent and mature
- shows tolerance and is not snobbish

II. Communications
- has empathy, sympathy, and understanding
- has the ability to communicate
- does not talk down to clients
- is willing to relate personally with the youth
- is sensitive and has ability to listen
- can instill goals in youth
- can make youth feel comfortable

III. Experience
- has good technical knowledge and skills
- has been well trained in counseling and guidance
- has good knowledge of community facilities
- has experience
- is realistic and practical
- ability to interpret test results

IV. Client Orientation
- has respect for youth's dignity
- is flexible
- does not force his own values on youth
- is non-authoritarian and non-punitive
- obtains good knowledge of youth's background
- tries to improve youth's self-image
- has a belief in youth's worth
- does not stereotype youth

V. New Professionalism
- has willingness to go to youth
- is not an 8:00 to 5:00 man
- is always available
- is willing to take risks
- is responsible
- is creative
- is willing to put forth extra effort

Table V

Best Youth Counselor

| Category (Presence of Attributes) | Before Response | After Response |
|---|---|---|
| "Boy Scout Virtues" | 31.6% | 33.7% |
| Communication Ability | 26.1% | 25.7% |
| Practical Experience | 21.7% | 18.8% |
| Client Orientation | 11.9% | 7.4% |
| New Professionalism (non-bureaucratic) | 8.7% | 14.4% |
| Total Number of Responses | 253 | 202 |

Table VI

Worst Youth Counselor

| Categories (Absence of Attributes) | Before Response | After Response |
|---|---|---|
| "Boy Scout Virtues" | 29.2% | 27.5% |
| Communication Ability | 18.3% | 21.0% |
| Practical Experience | 19.3% | 16.2% |
| Client Orientation | 22.8% | 21.0% |
| New Professionalism (non-bureaucratic) | 10.4% | 14.4% |
| Total Number of Responses | 202 | 167 |

Interpretation. As was the case with Schedule A the percentages in each category remain relatively consistent between the before and after responses. The exceptions to this statement are Categories IV and V. Client orientation is mentioned fewer times on the after response and the new professionalism is mentioned more often. Our interpretation of this result is that the two categories are probably related. The ideas associated with Category V are "risk taking," "willingness to go to the youth," "extra effort," etc. are all related to overcoming bureaucratic lethargy and serving the high school dropout youth. The ideas in Category V are concrete and the operational side of the more abstract client orientation. This interpretation fits when the clinical and emperical nature of the Employment Security Institute is taken into consideration.

SCHEDULE G

1. Please rank the following in order of their importance in the operation of a successful Youth Opportunity Center. Let "1" stand for the most important.

| | Before | After |
|---|---|---|
| Efficiency | (2) 2.83 | (2) 2.26 |
| Good community relations | (1) 1.94 | (1) 2.06 |
| Individual freedom of operation | (3) 3.22 | (3) 2.33[a] |
| Clear cut lines of authority | (7) 5.94 | (8) 7.00[b] |
| Adequate secretarial help | (8) 7.06 | (7) 6.28[c] |
| Strict rules | (9) 8.36 | (9) 8.56 |
| Knowing what the other guy is doing | (4) 4.75 | (4) 4.72 |
| Good physical accomodations | (5) 5.28 | (5) 5.00 |
| Well-motivated counselees | (6) 5.61 | (6) 6.00 |

[a]T = 2.098; D.F. = 70; Significant at .05 level.
[b]T = 3.168; D.F. = 69; Significant at .01 level.
[c]T = 2.573; D.F. = 72; Significant at .02 level.

Schedule G was designed to obtain an idea about how Youth Opportunity Center personnel rated the relative importance of the items listed to the operation of a YOC. This information should be of interest to YOC administrators. Of particular import is the rating of "individual freedom of operation," "clear cut lines of authority," "adequate secretarial help," and "strict rules." We believe that these rankings suggest probable areas of conflict between traditional employment administration with clear rules and regulations which maintain a stable and efficient system for dealing with routine problems and the innovative, change-inducing direction of a new program which seeks to find creative solutions to problems left unsolved by the stable system. The apparent conflict between "knowing what the other guy is doing" (rank four) and "clear cut lines of authority" (rank eight) is perhaps best explained if we recognize that the former relates to horizontal or colleague relationships while the latter probably is interpreted by participants as subordinate-superior relationships. Participants, we believe, want freedom to move rapidly without interference from above, but they wish to have coordination and cooperation with persons at their own level to avoid duplication and interference.

**EXTRACT FROM THE EVALUATION CONFERENCE OF THE EMPLOYMENT SECURITY INSTITUTE I June 11-13, 1965**

"The University of Colorado and the Oxford Hotel Extension of the University welcome you back to Denver. We're glad you are here at this meeting. As we indicated when we wrote letters to you telling you about this meeting, by and large it is not our intent to impart information at this three-day session, but rather to obtain it from you. We are looking forward to hearing this morning, and during the remainder of the day, how you are making out, what specifically is going on in your programs, and what are some of the problems that you are facing. We want this to be a free for all. We want the whole program to be wide open."

". . . I am not very well organized in what I should present or what I should say. Perhaps it would be best to start off by telling you what we have going. Our Youth Opportunity Center is processing Job Corps applicants. We have several Neighborhood Youth Corps programs in progress. We also have a MDTA multi-occupational program which is a basic education and skill-training program for approximately 155 young people. Most of the students are high school drop outs. Some are high school graduates, but generally they score from the fourth to the ninth grade in their reading level. About half of them have come from rural areas of our state.

". . . Actually, our YOC handles a large territory. We are located in the largest city of our state and serve wide areas of the state. In order to do this we have gone out into various communities and talked to such organizations as the welfare departments and police departments. Organizations and agencies have held meetings and called in community leaders. We have made speeches to these groups, and then periodically we go back out into these areas and make contacts.

". . . One of our biggest programs, from my point of view, is our multi-occupational program. The participants come from rural as well as urban areas. They are placed in a new situation the likes of which they've never experienced before, and of course they expect failure -- they have already dropped out once. One of the first things we have had to do is to arrange housing for all these people. Normally, landlords require rent in advance. Our students didn't have money for this, so we had to take charge. It meant that somebody had to stick his neck out. We didn't say, 'We'll pay if they don't.' But we had to make them believe they were going to get paid. Generally this was handled by working with the YWCA Young Adult's Committee, the YMCA director, etc. Initially all of the students were housed in the YWCA, the YMCA, and in one particular rooming house. We had to borrow beds from the air base.

"Someone in the Agency came up with a parental consent form which required the trainees to bring enough money to Albuquerque to last three weeks. This was a big joke -- at least half of these

people were on welfare, and we tell them they have to bring enough money to last three weeks! We actually got trainees who didn't have any money at all. Five of them arrived with $15.00 each, and they were considered rich. So, one of the first things we had to do was arrange to have these people paid as soon as possible. In our organization this is a little bit tough because we have certain days that they process and certain days that they pay. We finally got them paid. They threw me out of the tab section, but we got them paid.

"Also, because of YWCA policy, we had to arrange blood tests and tuberculin skin tests for all of the girls. This was something I objected to for various reasons, but we had to do it anyway. I knew if we ran skin tests on these girls from rural areas, we were going to get some reaction. We did. And the YWCA didn't know what to do about it. They just kept the girls anyway.

"Another thing we ran into right off the bat was that these were people who had never been to a doctor before. They don't go to a doctor unless they are dying or to find out why somebody else has died. However, the school requires that if one doesn't show up for school, he must have a doctor's certificate. We had people who were sick for all kinds of reasons, and we had to get them medical treatment. This meant calling doctors until we found one that would take a patient on the condition that he might get paid. We also had to do the same thing with dental treatment. And we had to arrange some way of getting prescriptions for people who needed them.

"Another one of the first things we had to do -- because of the type of people we were dealing with -- was to try to get them out of jail. We had to do this because anytime that you bring seventy sixteen to twenty-one year olds into town who are not employed and without parental supervision, the first time they come into contact with the law they wind up in jail. They run a stop light; they don't have a job; their parents aren't there; they are put in jail. Usually, all it takes to get one of them out of jail is to get in touch with the probation department and sign for them. The court will release people with minor offenses to any adult that will sign for them. And, if you have a boy from a town one hundred miles away, there is nobody there to sign for him unless you are willing to do it.

"One of the first things we did was arrange a free picnic for the trainees, teachers, and staff. This didn't have anything to do with MDTA really unless you looked at it as I did -- the trainees had to have a chance to see that the teachers and staff were interested in them. So we went out and played baseball together. We also arranged a dance for the students shortly after they got started in the program. It was a pretty wild dance! In fact, the adult chaperones who were there were shocked by the students' behavior. I got a lot of complaints about it. I was a little shocked myself. There were some kids that got more loving on the dance floor than I get in a month. However, the only answer I could give the people who criticized us for having the dance in the YWCA was that at least the kids weren't out on their own. There were sixty some bottles the next night at a party they held on their own.

"One of the things that I insisted on after we got started -- and I think that this is probably the answer to most problems of this kind -- was a student advisory group. I don't mean a group to give lip service, but a group to work out student problems. The students elected three persons from each training unit to represent them in their dealings with the school and with the Youth Opportunity Center. This was done, after they had been there two to four weeks, on a questionnaire to determine their reactions to the training and to get some criticisms that they might have at that time. (And they certainly have made some very constructive criticisms.) In all cases, the persons elected were the most mature in the group -- the ones they thought would be best able to deal with us.

"One of the things we have done with this advisory group is set up a credit union. They did it at my suggestion, but they did it themselves to handle such things as doctor bills, prescriptions, eye glasses, and things like this. We can talk about community resources from now until doom's day, but generally speaking I have been almost unable to work with them. We had to find some other way of getting things -- not six weeks from now -- but right now. The students started collecting a quarter each week from each person. It doesn't sound like much, but after four weeks of collecting, they had $155 in their pot. As I said, they use this money to pay for prescriptions, glasses, etc. And we were able to arrange for them to get glasses for $15 -- $5 for the examination and $10 for the glasses. These youths couldn't finance anything through regular channels because they aren't twenty-one years old. With this credit union they can borrow cash, pay for the glasses, and pay back the money into the fund at $2 a week.

"We also had to arrange for students to charge meals. You can talk about budgeting and all these things, but these were kids who had been given the first money they had ever had. Many of them spent it all on the first day. We had to arrange for them to charge meals not only before they received their first money, but for each week between checks. We also had to check the charge accounts to see that they didn't get too high. We had to encourage them to pay. We found that if we told a student, 'You owe twenty bucks down at the Union Cafe; you'd better get hot and pay it,' he could think of forty reasons why he couldn't pay it. But we found that if we went to the student advisory group and asked them to collect it from him, it would be paid.

"We arranged for special rates for certain things. Our mechanics had to have coveralls. Sears gave them a special rate. We had to arrange for them to cash their checks. We paid them alright, but they couldn't cash the checks. So we arranged for identification cards and for a store downtown -- in this case Sears -- to cash their checks.

"We have had a problem with absenteeism. I think that is a problem you are going to have with any MDTA program. The school calls in a list of absentees for the day and we start checking places where we think the kids might be. We don't know where everybody is, and this is a real problem because this is one thing that the school has handled like a school! The school administration says six tardies count as one absence; two unauthorized absences and the student must come before the board which decides whether or not he should be retained in the program. Now, I don't care what you do you are going to have a certain amount of absentees. And the trainees are going to have good reasons for being absent from their point of view, but very bad reasons from the teacher's point of view. They are not going to get the doctor's certificates that the teachers require, and so they are going to be charged with unauthorized absences.

"One of the problems connected with these programs -- and it will be a problem for anyone who works with programs of this nature -- is that we think of these MDTA training programs as our training programs when in actuality we have no control over the program once the contract is actually let. The only things we control are terminations and transfers from one type of training to another within the program. Other than that, it is under the supervision of the State Department. The school is supposed to consult with us regarding terminations, but they don't always do it. They feel like it is their problem and they will take care of it. Until the program nears completion and they start worrying about getting another contract, they look down on you just a little bit. When it nears completion, they come back and court you."

Question from another participant: "What types of vocational classes do you have?"

Answer: "Clerical, sales, auto mechanics, machine trades, hospital nurses' aides and orderlies, and a small group of groundskeepers and nurses. Actually, this program is called a total learning experience and it is. It has basic education - reading, writing, and arithmetic. It has skill training -- typing, shorthand, and what have you. But probably more important than any of these things is the group counseling that goes on during the training, and the fact that they are learning how to live on their own and stand on their own two feet. A great many of the kids we have in the program have never had any meaningful relationship with any adult. They are unable to cope with an adult world. They can't exist in it. Left as they are, they are going to be unable to get along in society, so the counseling and the many experiences they have are probably even more important than the skill training.

"I have spent a lot of time going over the questionnaires that we have gotten in training. Of course, we get some answers one would expect, but at the same time we find that they have more insight into their problems than we do. They realize what is going on. When we ask, 'What are you learning,' and get an answer, 'I am learning cooperation, responsibility, and how to get along with others,' we know we're on the right track."

Question: "Do I understand that you don't have basic education first and then vocational training?"

Answer: "The students are involved in vocational training right from the start."

Question: "Have you had any problems with this system?"

Answer: "No. In fact, I would go the other way."

Question: "Is this all done in one location?"

Answer: "No. We have two locations. The auto mechanics' and machine trades' section is separate from the others merely because of the type of facilities they need."

Question: "You said that they have had very little communication with adults. Do you think they want to?"

Answer: "Yes, they do. It is one of the things they ask for when they get a chance -- more meetings, more teacher-student relationships, things like this. The teachers were selected with the hope that they would be types who could relate to students -- who could have empathy with them. So far, at least, it has worked out pretty well, but one teacher can louse up the whole program. We have had this experience in one of our auto machine trade classes. We have a teacher who takes

absences personally. He isn't any good in dealing with young people. He threatens them. Hell! They've been threatened all their lives, and they react to this threat. This teacher has more absentees in his section than the whole rest of the school has. He has lost eight people already from his section and the rest of the school hasn't lost anybody."

Question: "How much voice did you have in the selection of these instructors?"

Answer: "None whatever. In fact, the only voice I have now is that I keep tormenting them until sometimes they give in."

Question: "I would like to have you elaborate on this problem of the teachers. Do you have anything to say about whether they continue to teach or not?"

Answer: "Only because they may respect me. There is nothing in the rules that says I do. But I started participating with the teachers when they first were orientated. I have had lots of contact with them. A lot of the teachers were involved in the dance and the picnic. So because of our relationship, I am allowed to do a lot of things that if they go back and check the book they aren't going to let me do."

Question: "Are you feeding back information?"

Answer: "It is not set up that way, but I have a lot of contact with the students. I don't see them everyday, but they come by my house to see me and I've had parties for them at my home. And I do feed information back to the school. However, I don't think it does a lot of good. If you have a teacher who is a task master -- drives the students a little too hard -- I don't think you are going to change him just by talking to him."

Question: "Could you talk a little bit more about how you create your own resources?"

Answer: "I don't really know how to explain it. One thing is to let the students do everything that they can -- not just what you think they can do -- but everything they can do. You can only help them to a point. They are going to have all kinds of problems. They are going to want you to call for utilities for an apartment. Tell them what to say and let them do the phoning. They can handle almost any of their own problems that you will let them handle. Give them a chance to discover that you are their friend, but let them do things for themselves."

Question: "Are you doing small group counseling with these kids?"

Answer: "Yes. The school is doing counseling and in addition our counselors are holding group sessions with the students. We have sixty students involved in six weekly sessions. The distinction between the school counseling and ours is that the school's is topic oriented. They have four sessions dealing with looking for a job. Their sessions are supposed to be more like ours, but the school has only two counselors, one of whom spends most of his time record-keeping, handling functions, teachers, etc., and the other counselor is a very directive sort of person with whom the students won't consult."

Question: "Could you tell us about your own experiences in group counseling?"

Answer: "We have six weekly unstructured sessions. We let them talk on whatever subject they wish. Most of our sessions so far have dealt with this one teacher and how to get rid of him. These students do interact and the learning experiences have been good. Our counseling is still in it's infancy though, and we have a lot of experimenting to do yet.

"I have eight students in my group and, as I said, the sessions are unstructured. I don't tell the students what to discuss nor offer any opinions. The only time we could arrange to do the counseling is during the students' study periods.

"We look for these group counseling sessions to be solutions to some of our problems. Frankly, we have problems that we don't know how to work with at all. I will give you a couple of examples of problems that have me stymied.

"We have at least ten unwed mothers in our group of students, and heaven only knows how many we will have when we are through the program. Most of our girls have one big thing in common -- insecurity. They cling to people. They will do anything for a friend -- anything in the world. This is something I hope they will be able to work with in group sessions.

"Another problem we have had is fighting. There are thirty-four boys in the machine trades who were here about four weeks before the rest of the students arrived. They are in a separate location. When the girls arrived, these boys began going to the other location where the girls are, and the boys in that area didn't like this. The result was some rather serious fighting. We had two boys who were worked over with a beer can opener. One ended up with a broken wrist."

Question: "Are these fights between your boys and the local boys?"

Answer: "There's been fighting every which way. We've had fighting between groups of our own boys and between our boys and the local boys. We are making some progress, however, against this problem. Now when someone starts raising hell, some of the boys will call the police. This is a step in the right direction. In one incident when some boys threw firecrackers in one of our boy's car, instead of stopping and stomping hell out of those boys, our boys called the police to come pick them up.

"I talked to the boys in the machine trades and told them that the school was about to start kicking boys out if the fighting didn't stop. The boys said that they would take care of the problem. They said that if any more fighting did occur, they would choose the boys to be kicked out of the program. The fighting has completely stopped. But it could start up again."

Question: "In your group sessions do you talk about fighting?"

Answer: "Oh, yes. And illegitimacy."

Question: "Do you think that this is having any affect?"

Answer: "Yes I do."

Question: "What is the source of your applicants? You apparently are drawing from all over the state."

Answer: "Yes we are. We get applicants from the welfare departments, from the vocational rehabilitation center, from counselors in schools, from parole officers, from priests, from sheriffs. Others came from the files of a Manpower Study that was conducted sometime before. The selection was done in the various local employment offices."

Question: "Did you have any reservations about accepting a sixteen-year-old kid coming from two hundred miles away?"

Answer: "No. The selection was up to the counselors. We did the interviewing and gave them tests. Then we sat down with the counselors and went over the results of the tests of each person before the counseling began.

"Most of the applicants scored from the sixth to ninth grade level, but we had a few who scored at fourth grade level. We had a boy who had lost an arm, and it bothered him a great deal in his association with people. Even though he scored at a fourth grade level, they permitted us to take him into the program because we felt his exposure to people would benefit him greatly. This is the way I feel about our training, though the schools don't always agree with me. I feel if these kids learn responsibility, dependability -- the characteristics of an employable person -- even if they don't learn extensive skills, they still have made an awful lot of progress."

Question: "Have you had many dealings with the police in connection with your students?"

Answer: "We have quite a number of trainees on probation and we've had dealings with the police on the average of once or twice a week. I advocate going with the trainee to see his parole officer because, although most of parole officers are pretty good, occasionally one is going to cause you trouble. We had a kid picked up for having another boy's ID card. He was seventeen; the card was for an eighteen year old. He was tossed in jail and when he went before his probation officer, he received a stern lecture on how he should not be in the city and how he should not have left his parents. I was irritated about this because in many cases -- and the kids will tell you this themselves -- their parents couldn't care less where they are. In general, however, the probation officers are helping rather than hurting us.

"We've had cases where I am afraid the kids would have been returned to correctional institutions if we hadn't been there. One girl was picked up for promiscuity and, if we hadn't sent someone along with her for her interview with the probation officer, she would have been locked up."

Question: "Who goes with them?"

Answer: "I send as an important a person as I can find. In the case of girls, a woman who is the wife of a vice president of the University has helped us as a volunteer. In the case of boys, I go myself or get the district supervisor to go.

"It is amazing what these kids will do. It's a tragedy. One kid was at a party and got pretty polluted. He went out to see an accident that occurred on the street. He doesn't like police officers and he started mouthing off. The officers took him by the arm back to the apartment. He wouldn't stay there. He went back out and called one officer a "rookie." They handcuffed him and put him in the squad car. It turns out that this boy is an epileptic. He had a seizure in the front seat of the squad car and kicked out the windshield. The police took him to jail. Of course, he had barbituates with him to take to help control his seizures. They charged him with possession of narcotics, being drunk, and for destruction of public property! They couldn't prove it, but he went into court and pleaded guilty. The district supervisor had already talked to the judge and the judge had to shut the boy up!"

Question: "Is there a difference in absenteeism between the local youth who participate in the program and the out-of-town youth?"

Answer: "We have less trouble overall with the out-of-town people."

Question: "Do you attribute this to being housed in one place?"

Answer: "I attribute this to their being in a different environment. We wanted the girls to live at the YWCA until they became oriented and learned to be on their own and until they accumulated a few things for an apartment. I felt that if they were with us a month or two and then went back to the sheepherders' ranches, we had lost. Even if they complete training and then go back to the same area where there is no employment to be found, we have lost everything. So we wanted them to learn to be on their own, to become self-sufficient. But a number of the girls are still living in the YWCA because we can't get them other housing.

"For example, one of the hotels called us when the publicity about the program appeared. They said they would like to have some girls and would give them special rates. We went out and talked to the manager several times because we had had experience with do-gooders which has made it rough on us. Sure enough, she took eight girls and things were great until she saw the girls. Here are these sixteen, seventeen, eighteen year old girls who are a little brazen-looking. As soon as she saw them, she began to worry. To make a long story short, three days later -- without any notice -- she kicked them out. She admitted that they didn't do anything wrong. But they worried her. We were just lucky enough to be able to get them back into the YWCA, and there they have stayed because they were so frustrated in their first attempt to move out on their own.

"We've had another problem, too. Let's face it. These kids are going to party. We expect them to, but a lot of people don't. Some persons seem to expect these students to act like they are forty-five years old, fed up with sex, and everything else. They are not. So the first time they start making noise or the cops show up, the landlord tells them they have to move. We've had a big problem with one group of about eight people who have had to move about five times. The rest of the kids have learned from one move."

Question: "What do you think the chances are for employing these people in your area upon their completion of the training course? Are you having any success in meeting their needs for part-time work?"

Answer: "This is very hard to answer because our operations are changing so fast. Three weeks ago I would have said that the employment picture was rotten, but it has improved so much that I would say our chances are very good of placing them when they are finished with the course. I don't know whether you know it or not, but placement of MDTA graduates is running from seventy to ninety per cent anyway. The government looks at it this way: If even twenty per cent of these people complete the program and develop the skills for which they have been trained, the government actually will make money on the project. The kids are certainly going to be more employable than if we didn't bring them into training in the first place."

Question: "What is causing the employment picture in your area to change?"

Answer: "The public didn't know we were even there for a while, but now as we have more and more contact with the public, we get more job orders."

Question: "How are you getting this visibility?"

Answer: "Continuous contact. We've had newspaper coverage and television coverage constantly flooding the community."

Question: "You said earlier that you knew what your trainees' problems were. What is the basis for this statement? Did the trainees check off answers on a questionnaire or did they state their problems in their own language?"

Answer: "We prepared a questionnaire with open end questions. The trainees did not have to identify themselves. To the question, 'Why did you enroll in this training program?', I will give you some of the answers they gave:

'These drop outs count me in. I won't even have a chance to work in ditches, and that's something I don't want to do.'

'I wasn't getting anywhere in the world without any skills at all. I just wasn't smart enough to get a worthwhile job.'

'Jobs seem almost impossible to get without some training.'

'I need something to substitute for the diploma I didn't get in high school.'

'I wanted to further my education and couldn't do it anywhere else because of financial difficulties. I also needed someone to back me to enable me to get a respectable job.'

"Here's one we got time after time after time:

'Because this is my last chance to do something with my life, something useful except existing without purpose.'

"Reactions to the question, 'What are you learning?' also gave us the feeling that these kids recognize their problems. Of course, many of them gave answers like, 'I'm learning to be a salesman' or 'I'm learning to type,' but many said, 'I'm learning responsibility and cooperation.' 'I'm learning how to get along with others.' 'I'm learning to deal with the public.' These answers show they know they need these things. Also, I think it is evident from the group counseling sessions that they recognize their problems. In group sessions these students will say things like, 'I recognize my problem. I like to drink.' Or the girls say, 'I like to play around with the boys and I would like to change this.' 'I want to change my attitude and outlook.' Naturally, it is a long, drawn out process, but I do believe that these kids know what their basic problems are. It is a matter of drawing them out. They are quite withdrawn. They come to a counselor thinking he is akin to the probation or law officer. This feeling has to be broken down and it takes three or four sessions to establish some rapport.

"In this same connection -- and this is a problem I think you will have in many places -- we are making arrangements now to start group therapy. There are a large number of our people that are emotionally unstable, that have psychological problems, and need help. A number of the students recognize this and come to us saying, 'I need help.' So we are working out a way to give them therapy, and it must be free because they can't afford $20 an hour."

Question: "How are you working this out?"

Answer: "We have a psychiatrist who has volunteered his services."

Question: "Did you give the questionnaire to the trainees when they first arrived?"

Answer: "No, they had been there anywhere from two to six weeks, depending on which group they were in."

Question: "Have you had anyone join the program just for the money?"

Answer: "No. We had one that said, 'I wasn't doing anything and my parents got mad at me and sent me down here.' But no, I'd say we didn't have any join just for the money. Initially that might have been part of the reason, but there were other things too.

"One of the things that we asked in our survey was, 'Do you think you are in the right path of training now?' We had five 'no' answers. In one case we know we goofed; in a couple of cases the trainees had changed their minds; and in another case what was wanted wasn't available."

Question: "Do you have any married people in the program?"

Answer: "Yes, but not very many. Out of one hundred and fifty people, we probably have about fifteen that are married."

Question: "Could you give us a brief description of these people -- their racial background and things like that?"

Answer: "We have about every racial background represented. As far as their educational background, we have quite a number of high school graduates -- about forty. Of course, these high school graduates score anywhere from the sixth to the ninth grade level. This isn't too surprising as they come from places with segregated schools like Mississippi. They come from missions and small towns. One of their main problems is a low verbal ability. And they have a very poor reading ability. Interestingly enough, there have been tremendous changes in their appearances and attitudes. In fact, you wouldn't associate them now with the low income groups at all."

Question: "What tests did you use in selection?"

Answer: "We used the GATB, the Stanford Achievement test, and in some cases the Interest-Check test."

Question: "With their low verbal and reading abilities, don't you send them through basic literacy training?"

Answer: "We don't have basic literacy training. Essentially we have basic education training starting at the fourth-grade level in math and reading which uses teaching machines. We have kids tell us that they have learned more math in four weeks than they ever learned in high school."

Question: "Were there any problems connected with recruiting for MDTA?"

Answer: "One thing that has nearly caused me to tear my hair out is that when you begin recruiting for MDTA, you'd better be damned sure what the trainees are going to be paid before you tell them an amount. Some were told the length of training would be one thing and it was another. Some were told they would receive $35 a week subsistence. Actually, it is $5 a day, and you'd better make him understand that it is $5 a day and not $35 a week. Another problem is that the requirements for the youth allowance are that the trainee either be a high school graduate or out of school for a year. However, there is an exception to that requirement which drives people into frenzy. The exception is that if a statement is obtained from a counselor saying that the person is receiving counseling, or special services, or special education courses, the period he is enrolled in this counseling or special services counts toward the one year out of school. Documenting this is the problem. We had a lot of people that thought they would receive $55 a week and they received nothing at all. It has caused severe hardship for some. The office thought that the trainees could get by on the subsistence without the youth allowance, and he can't. It takes a very frugal person to get by on $35. Maybe we could, but they can't."

Question: "Going back to the counseling situtation, you mentioned that you have one hundred and fifty people in this training program. How many counselors serve them on an individual basis? Are they assigned to counsellors or what?"

Answer: "The school has two counselors and will have a third one next week. They all have individual sessions. We recognized that the school has one counseling function and that the YOC has an on-going commitment with the follow-up placement. We are going to out-station a counselor in the school to do individual counseling as well as having it in the YOC.

"We talked before about limiting ourselves as to what we can and can't do. A beautiful example of this was when the schools helped draft the proposal with the Employment Service. They proposed a counselor and a half because that is what they thought the Bureau would approve. They probably need fifteen counselors, and they found out later that if the Bureau had thought they needed fifteen counselors, they probably would have approved them. A good ratio is about one counselor to every twenty or twenty-five students."

Question: "What is the image that you think the YOC has in the community? Is it beginning to identify you as working with the disadvantaged only?"

Answer: "No, not yet, but we are worried. Right now people have a 'wait and see' type attitude about us. I think this will reconcile itself. We have so many outlets now -- Neighborhood Youth Corps, Job Corps, etc. These are going to take approximately seven hundred kids off the labor market and they are not competing against the high school graduate either. We video taped some interviews with high school graduates which were on television. The response was good."

Question: "But the big play is toward the disadvantaged?"

Answer: "Yes, and it's a problem. I feel we should have a program to offer middle-class kids too, but we don't."

Question: "How many of your staff are working with the disadvantaged youth?"

Answer: "Most of them are spending all of their time working with the disadvantaged kids. We ought to be able to work with both."

Question: "You don't have counselors that work with the high school graduates?"

Answer: "We were set up to work with the disadvantaged and with those who weren't ready for employment."

Question: "Don't you think we should do both jobs? It is my conception from the information we get from the Bureau that we have recently become the employment office for all youth."

Answer: "It is the Youth Opportunity Center, but we are identifying with the persons with the greatest needs and concentrating on them. We also do the regular work of employment services in the matching of jobs."

Question: "Should we build an image of a Youth Opportunity Center, not a Disadvantaged Youth Opportunity Center?"

Answer: "In some centers we want the image that we work with only the disadvantaged. If the disadvantaged youth get the idea we are working with the middle class too, they will quit coming."

Editor's Note: At this point other members of the group join the discussion.

"We have two offices: one works with the disadvantaged and the other works with middle-class youths."

"One of our problems has been how to determine who is disadvantaged, and which office should serve the youth. He gets shuffled back and forth. So I believe that the best way we can work is as a Youth Opportunity Center and work with all youth as best we can."

"A big complaint that I have heard all over -- from principals, administrators, counselors -- is that the YOC is getting a lot of publicity about working with the disadvantaged, but what are we going to do with all the high school graduates. It is quite a problem. Mothers complain because their children come in and we have nothing for them. One man raised the roof because his kid had put in quite an effort to stay in school and get the skills and the diploma. Yet we had nothing for him."

"I hold that any youth that is unemployed is disadvantaged."

"Here. Here."

"I feel that the regular employment office gets a great many job orders that our kids could fill. We had an agreement with them that any order that could be filled by our youth would be sent to us, but it didn't work. We either didn't get the order at all or it was four or five days late in coming or they had already made two or three referrals on it before they sent it to us. So for the first two or three months of our operation, we had no job orders. All the job openings were phoned to the regular employment service, but we are overcoming this now because more people know we exist and all of the federal agencies call us at the stimulation of President Johnson."

Question: "Who are you getting to fill the federal orders?"

Answer: "It depends upon the agency. In some cases the applicants had to be disadvantaged.

In other cases they said, 'Let's balance it out. We'll take about half that are disadvantaged and half that are not.' In other cases we just did the best we could. We are catching hell from all angles. We have parents, teachers, counselors, people from all walks of life calling for help."

"I plug for the high school graduate. I think they deserve something after they have gone that far. Last week the television station cooperated with us and I took three girls up and made fifty second tapes with each girl. As a result employers called and two of the girls were referred. Next week we are going to take six more girls."

"One thing to remember is that the high school graduate is going to have fewer youth competing with him on the job market, because we are taking those in need of education in order to become employable out of the labor market."

"I don't know. I think you're still going to have an awful amount of competition for jobs whether you have MDTA programs, Job Corps, YOC's or not. I recall that there were some three thousand graduates in your city a few months ago, and that's a lot of competition."

"One thing I want to comment on is that you should never overlook other agencies as far as helping you is concerned. You may not get any help, but then again you may get a lot more than you expect. This has been particularly true in our dealings with outlying areas -- the probation officers, the welfare departments, the county sheriffs have been of immeasurable help."

Question: "This is interesting. Why do you get cooperation from the rural counties and not from the urban areas?"

Answer: "I don't know. I was damn lucky to get in the city welfare office. They said they knew everything I had to say. I said that I had some materials for them and they replied that they had boxes of that kind of stuff down in the basement. To this day they don't even know I was there. I went to a small town welfare office and the first thing they did was call a staff conference. We had a two-hour meeting right then. Later we had a conference with some of the community people. I went to another small town and they did exactly the same thing. They suggested a half dozen community leaders that I could see while I was there. I had meetings with bankers and with newspaper editors. Many ran rather long articles in the papers. As a result of one article, a sheriff brought six boys over to join the Job Corps all on his own. He was there all day with them. I got referrals to the MDTA training program from welfare departments and from probation officers. This was the kind of cooperation I got from the rural areas."

Question: "Do you think part of the reason for this is because in rural areas the agencies know their people?"

Answer: "That's my feeling. They know their clients. The standard caseload in a major city for a probation officer, for instance, is one hundred. Try to get additional effort on his part."

"One thing that bothers me is that individual welfare workers have repeatedly called us wanting information, but the administrative people we originally contacted gave us no help at all. The caseworkers and other welfare offices in the state hadn't receive any information on the Job Corps or MDTA although the main office had been informed of these programs."

Question: "You have been in operation about five months now. You have the Job Corps, NYC, regular placement, and the MDTA multi-occupational courses. What is your experience in your area with kids coming in? Are they still coming in or do you have to go out for them?"

Answer: "I would bet you that today if it is not raining, the kids are lined up for a block. Probably the main complaint that we've had from the depressed communities is that, 'I sent Johnnie down there three months ago and nothing has happened.'"

Question: "You haven't had to out reach then?"

Answer: "Oh, yes. I have contacted practically every community center or shelter house in the city myself. We are getting referrals from them. I've contacted community leaders and we are getting referrals from them."

Question: "Do you have someone assigned to work specifically in out reach all of the time?"

Answer: "Yes, four people. And they are out of the office at all times. I feel that there is too much dealing with other agencies at arm's length. I try to get my people out as much as possible. Rather than mail forms to them, we carry them over so we can have conversations with them and build up our relationships."

"I think the Youth Opportunity Centers are suffering in comparison with the other poverty programs. The Job Corps has had a lot of national publicity. The YOC isn't mentioned. The Neighborhood Youth Corps get big spreads, but not the YOC's. I think we are more important than that. It hasn't been easy to create a good public image in our area of the YOC's. The fact that Youth Opportunity Centers are a part of the War on Poverty has tinted the political attitudes of the community. If a center is located in the midst of a democratic area, it is accepted with open arms. If it is located in a republican area, it is met with opposition.

"Another problem I feel exists is that there is a certain amount of professional jealousy from heads of certain offices. We are getting lip service from the head of the welfare department in our city, but it isn't reflected in the number of referrals we are getting from them."

## "IF I HAD MY DRUTHERS"

"I suppose an agenda should never dominate any given situation, but it is intended for you to instruct us on how to run a training school for a new group of counselors. This session is called: "If I had My Druthers or Never Do That Again." I would like to get from you what we should not do that we did do and what we should do that we did not do; what we should be sure to do and what we should be sure not to do. From listening to you, it seems that the curriculum should include a lot more about jails. But we would like to have you tell us how you think a training school could be run better. One thing we don't want to hear, if I may impose a limit -- and I believe in certain limitations because I read a book about child rearing in which it said if you don't have any limits at all, there is no sense of permissiveness -- is your suggesting a total change in personnel."

"How about a total change in personnel policy for intake?"

"Yes, we would be interested in hearing about that."

"The State Employment Service programs don't take into consideration the attitudes of the person that is going to go into the training program. I was the only person from my state who came because I demanded to come."

"Does that have any implications about the way recruitment for the training program should be done next time or anything the University might be able to do about the problem?"

"From the conversations I have had with the other trainees, I gather participating in the training program was an assignment made to the personnel. There was no counseling involved in the selection of the personnel who attended the Institute. Nobody knew what was going to be involved. It was like asking a student if he would like to be a welder. He hasn't seen a welder; knows nothing about the job, but he says, 'Yep, I think I'd like that.' It would have been pretty hard at the time for anyone to have told us what we would be doing in terms of job description. However, I think there should have been an effort to determine the attitudes of the persons that were being brought into the program to see whether or not these persons were trainable."

"I thought that, too. But next time the Employment Services will know what is involved in the training program and there will be better selection of personnel."

"Do you have any ideas on curriculum?"

"I think that in all of the material presented to us and all of the speakers we had, there might have been a Negro speak to the group. It might have made the Negro feel more a part of this movement of <u>all</u> youth instead of being excluded at the very beginning in the training program."

"How many Negroes are working in our agencies around the Rocky Mountain region? I was at the University of South Carolina a couple of weeks ago for their training program, and they had a higher percentage of Negroes in the class there than they do here. I thought it strange that there was more participation by Negroes in a conservative state than there is in the Rocky Mountain area."

"Maybe the lack of Negro participation in The Colorado School and in our offices has resulted in a lack of Negro participation in our programs. The emphasis in the last meeting was primarily on Spanish-American problems. I will admit that it is a great problem; they are less organized and in much greater need of help than the Negroes, but we have not had the proportionate response from the Negroes. Possibly this indicates that the Negro is not so well organized or not as informed."

"Perhaps this arises from the fact that one of the big motivating factors of the whole Negro civil right's movement has been the value placed on a formal education."

"This may be true, but having worked in a Negro community for three years, I happen to know that their dropout rate is one of the highest in the area."

"We have a good many southern Negroes coming into our area and we have worked pretty hard with the Negro community, but we haven't come up with too much response. I don't think there is anything that we are doing that is causing the Negro community to object to our services. I think they are not interested in our services. Obviously, we should not exclude the Negro, but I think our services should be pointed toward the Spanish-American community primarily."

"I am not worried about the fact that if ten per cent of the population is Negro, that there should be ten per cent Negro participation in the program. I don't think that's important. What I am trying to say is that I don't think we are communicating with the Negro deprived as well as we are with the Spanish-American underprivileged. The Negroes are entitled to the knowledge; if they don't use it, that is something different. But why aren't the Negroes accepting our program? To date we have yet to have a Negro Job Corps applicant in our YOC. I would like to know why they are not responding."

"What about physical arrangements; for instance, in the classroom? We have heard from some people that the chairs were too hard."

"I personally do not feel that the classroom arrangements or the site of the classroom was nearly as vital as the atmosphere that you created -- the method in which you presented your material. I do know that the site and methods of dress were quite impressive, but actually it was the people to whom we were exposed that made the change in us. It was the tremendous content, the vitality, the message of the people who talked to us that affected us."

"I go along with that. I don't think that the location was terribly important, but it created quite an impact initially."

"It had an impact on basic instructors, though, that a different site would have changed."

"How about moving the classroom around -- the Glenarm YMCA for a few days, then a community center, and so on."

"I think the classroom should have been on 32nd and Curtis. This location is too bourgeoisie."

"Some of the teachers presented their lectures in too academic a manner. We had some of our staff go to another location for some training, and one of their criticisms was that it was all too traditional. I think that the setting you had here shook us up. Made us think. It was good."

"I concur. It had quite an impact on me. It gave a person some food for thought. It was like taking a look in the box to see what the hell is in it."

"Then we go back and sit in our new offices -- fresh paint, new furniture. . . "

"But it still had an effect on our thinking."

"And what you might not have considered is that the surroundings might have had an effect on the professors, too."

"How about bringing in a few people from volunteer agencies, especially well-known people within the community. These volunteers can be extremely helpful in the YOC program. We could hear their story and let them hear ours."

"One of the main points in the talk we had last night seemed to me to be that we need to learn to cooperate not only with the volunteers but with the welfare departments and other agencies. The welfare people have been condemned here, there, and everywhere. I would like to see in the next session a welfare director from some other locality come in and speak to us. These agency people from big towns talk too big."

"The problems are the same in both rural and urban areas, but the techniques are different. It is a bit different to try to convince the three hundred people in Glenrock that there is a need of jobs for three, five, or ten people than it is to convince people in an area of 100,000. The job is easier when these 100,000 people can pick up a newspaper and read daily about all the kinds of trouble."

"It would be money well spent if we could invite three or four people from outside of our own agency to join us. If we could get a director of an MDTA project, for instance, to join us, I think we would all benefit. It seems to me that we have been very critical of them, and they, in turn, have been critical of us."

"Do you have any other specific groups in mind to invite?"

"Vocational Rehabilitation."

"Turn it into an OEO conference."

"I wonder if this wouldn't be just the thing to do. We've talked about inter-agency cooperation and this sort of thing. It would limit the number of Employment Security people, but it might be very worthwhile to bring the welfare directors here, judges from juvenile courts, and so on."

"I think it would be important to get people like the county commissioners who are opposed to our programs. Let us hear their side. I don't think it would be difficult to get one or two of the conservative ranchers to come and give us their opinions. Also, let us hear from persons in Detroit, for instance, where they have had lots of problems. We need to hear about things that were not successful because we can learn as much from failure as we can from success."

"How about setting up a project to give formal public school teachers an informal education. It is not directly connected with our plans, but certainly pertinent."

"I have the feeling that you ought to take the trainees to a small community because an awful lot of people aren't going to be working in urban centers. We have 350,000 people in our whole state, not just in one town. It is a different kind of operation entirely. It is fine to talk about all of these agencies, but in a small town people are served on a transient basis. In a lot of cases they are not served at all. For instance, there are only three county health stations in our whole state. That's all."

"Another problem is that this training program was primarily for people that are doing the face-to-face work. Yet, to accomplish what you want to accomplish in some situations, you must have administrative people with the understanding of poverty to run interference with the red tape from above, so that the counselors aren't frustrated to death."

"I think it might be good to involve the trainees in such things as following up on getting a parental consent form filled out for the Job Corps."

"You've hit the nail right on the head. I think that there has to be more practical experience. I would like to have the opportunity to sit down at the table with the basic instructors and Tom Adams, not just watch them. And, also, it might be good to have one basic instructor as obnoxious as possible."

"You did right well having us ride with the police, but couldn't you also arrange to have one or two home visits with a social worker and some visits with parole officers?"

"I was taken on a tour the other day by a community worker that would be extremely helpful to the YOC trainees. I was taken to the homes of several boys and girls, driven down alleys, taken to a bar where prostitutes hang out, to another bar where parents of students hang out, to another one where dope is pushed, and all the time we were talking, talking, talking about the problems. It was very good."

"Except for the few things that have been mentioned, it will be pretty hard for you to come up with a more helpful program than the one you had. Many of the things that apply here apply differently somewhere else to different people. But, if what you were trying to accomplish in that first three-week session was a change in attitudes and ideas, your program was pretty darn good the way it was."

*YOUTH OPPORTUNITY CENTERS

The Colorado Department of Employment requested that the Extension Division of the University of Colorado propose and conduct a special training program for employees of Youth Opportunity Centers in Montana, New Mexico, Wyoming, and Colorado. The resulting proposal, funded by the United States Department of Labor and included in this report, outlines an experimental 3-week intensive training course which included such non-traditional approaches to education as (1) placing the educational setting in a poverty area, (2) requiring participants to involve themselves completely in the setting, (3) encouraging participants to seek part-time employment in the area, and (4) involving indigent personnel along with professional educators in the process of teaching the participants. The program itself had as a major objective to help Youth Opportunity Center counselors to acquire an awareness of the nature of the problems facing youth. The entire content of the Institute is outlined, parts of the proceedings are presented, and evaluations of its impact on counselors are included. A report of the second Institute, held in 1966, is VT 005 051. (ET)

## Acknowledgments

We wish to express recognition for the cooperation of many persons which enabled us to carry out the Employment Security Institute on the Management and Operation of Youth Opportunity Programs:

. . . first, to Mr. Carl Haberl, Special Services Supervisor of the Colorado Department of Employment, who brought the Government and the University together;

. . . to the staff of the Regional Office of the Department of Labor, Bureau of Employment Security, who gave help and showed warm interest in the Institute and its progress;

. . . to Mr. John Meehan, Chief, Branch of State Training and Executive Development, Bureau of Employment Security, U.S. Department of Labor in Washington, who represented Colorado to Washington and Washington to Colorado;

. . . to Dean Mack Easton of the University of Colorado Extension Division and staff members of his office; Assistant Dean Avon Bristow, Mr. William Grelle, Mrs. Patricia Orton and her secretarial staff who worked beyond the call of duty;

. . . to Lois Badger, Director of the Bureau of Correspondence Study of the University of Colorado Extension Division in whose eye the Institute was a gleam;

. . . to John Eastlick and the Denver Library for their cooperation;

. . . to Daniel Hoffman, the Manager of Safety of the City and County of Denver and to Chief Harold Dill and the members of his Denver Police Department, who were exceedingly cooperative and helpful, and who provided services which enriched the experiences of the participants;

. . . to the good citizens of Denver who came to the hurriedly-called Symposium on the Culture of Poverty and who provided by their voluntary expression of opinion the necessary view of the overall picture which enabled us to move with some sort of speed;

. . . to the management of the Oxford Hotel who were able to meet extraordinary exigencies for our unusual program and who provided both facilities and hospitality;

. . . to the Rocky Mountain News, the Denver Post, and KOA Television, who showed sympathetic understanding of what the Institute was trying to do;

. . . to the students in the Graduate School of the Department of Sociology, who worked tirelessly during the Institute and who subsequently helped to prepare this report;

. . . to the Bureau of Sociological Research of the Institute of Behavioral Science who gave quick and ready assistance in the preparation of the evaluation instruments;

. . . to the Western Interstate Commission for Higher Education and to the Department of Sociology of the University of Colorado for their support;

. . . and, finally, to all the faculty who responded to the request to participate on short notice, and who wholeheartedly threw themselves into this venture.

. . . To these persons, and still more, we wish to express our debt.

## Preface

When the President declared his "war on poverty," there was less than an enthusiastic response from the universities and the institutions of opinion in the United States.

Some persons have taken the view that "the poor are always with us." Older persons remember in the height of the depression when various programs attacking the problem of poverty were begun. Whether or not these programs might have resulted in the development of a professionalized body of technology, knowledge, and staff trained and able to work in this field will not be known. Almost at the time of their inception these programs were interrupted by the appearance of World War II.

Among other things, the war produced an apparent economic prosperity which gave rise to the slogan, the "economy of abundance," and an unprecedented preoccupation with world affairs. Perhaps the most obvious change in the role of the university in postwar America has been in education and research in the problems of international relations, disarmament, foreign aid, and war and peace.

In the 1930's, among the very few courses in Sociology at the University of Colorado, there were Criminology, Penology, Dependency, and the Sociology of Poverty. An examination of the University curricula in the 1950's and 1960's reveals a disappearance of the subject of poverty as a social problem.

During the period of national hysteria in the early 1950's, sometimes referred to as "the McCarthy era," the educational institutions were under heavy attack. Many scholars took protection from public criticism by describing their efforts in neutral terms, writing politically sterile studies defended invariably by numbers replicable in computing machines.

The problem of poverty in a world threatened by international disorder and thermo-nuclear devastation was almost invisible. Magnificent new buildings were erected in areas of urban deterioration as evidence of America's material progress, but one block away from New York's Lincoln Center Americans are still living in conditions at the subsistence level. Progress has been made. In the 1930's one third of the nation was ill-housed, ill-clothed, and ill-fed. We know now that one fifth of the nation remains in this condition.

The magnificence of the Marshall Plan began a program for the economic development of devastated foreign nations. However ambivalent may have been our feelings about it, Americans have become accustomed to tithing regularly for foreign aid for the disadvantaged people of Asia, Africa, and Latin America. The same arguments that persuaded us that economically viable foreign economies are necessary to our own economic well being are true for the long-run dependence of the quality of life of the advantaged American upon the quality of the twenty per cent of Americans living without opportunity.

The meagerness of the designs for urban renewal to date have taught us that merely tearing down the slums where these people live and replacing them with high rise apartment houses and insurance buildings may affect the landscape but not the problem (for the inhabitants merely must move elsewhere.) Studies on the potential impact of automation on industries and the rapidly rising awareness of the disappearance of the need for the unskilled worker project for us the fact that left alone the problem will, far from solving itself, become an increasingly intolerable one.

Although the university has characterized itself as primarily devoted to pure research and abstract thought, inspection will reveal that throughout history the university has been at the cutting edge of society itself.

It is in this spirit that the University of Colorado responded to the request of the United States Department of Labor to provide a training course for use by counselors that would enable them to deal more effectively with the young men and women who seem to be outside the main current of American life. We chose to begin to tackle this problem by taking ourselves and our students to the problem itself.

The thought of returning the university to the scene of the human drama at the level of primary group relations suggests the possibility of the re-moralization of the student and the faculty in their relationship to the community.

## Chapter I

### The Future Role of the University in Youth Opportunity Programs

It is interesting that while the universities, under the stimulation of the United States Department of Agriculture, were fairly active in the development of rural sociology and carried on both research and training and expressed a concern for the development of the rural communities of America, no parallel program developed for the urban community.

The university is particularly equipped for a wide range of activities in the development of Youth Opportunity Programs as well as other aspects of the War on Poverty.

Such professional training and body of knowledge as there are in the universities are largely confined to the areas of testing and counselling and the pedagogy and education in the traditional middle class white Anglo school system. Ameliorative work has been carried on in America's schools of social work education which has assigned itself in the rather narrow pattern of case-load technology circumscribed by the prerequisite of the client's initiation of the relationship. Because of a lack of professional staff and of behavioral science knowledge, there is abundant room for university programs in the community. Some universities have worked in this direction. Of special note is Wayne State University's studies in Detroit carried on under the direction of Mel J. Ravitz.

In addition to the traditional departments of Anthropology, Education, Medicine, Economics, Sociology, Psychology, and Public Administration in the university, the Institute of Behavioral Science and the university's Extension Division provide instruments for a wide range of projects.

The university is prepared to engage in pilot projects and experiments to find out what will and what will not work. The university is prepared to engage in careful long-run research leading to a growth in our knowledge. The university is prepared to engage in short-run evaluations or demonstrations indicating probablistic efficiencies of alternative schemes.

The university is prepared to engage in the training of new professional personnel. The university can experiment with new methods of teaching children to supplement the techniques which, while successful for the transmission of the major values of the majority culture, have produced the current push outs. The university can study the problems of motivation and questions of personality structure of this group as they have with the extreme deviant, such as the criminal.

The university can study the opportunity structure and its effect on human behavior as well as conditions prerequisite to changes. The university can work in teacher-training, particularly in the training of prefessionals for teaching functionally illiterate adults and for the teaching of English as a second language. And last, of course, the university is prepared to provide consultants to government and private agencies.

The future role of the university will depend upon a cooperative relationship of mutual respect and trust between the academic and non-academic institutions.

## Chapter II

## Request for a Program

The Poverty Program of the President suggested that there would be an expansion of the role of the Employment Security Division of Departments of Employment. Among other things the Departments of Employment have provided counselling service and assisted in the placement of high school youth in jobs.

Disadvantaged youth who have dropped out of school tend to disappear into the inner community. Under the new programs, the Departments of Employment are establishing Youth Opportunity Centers specifically to deal with the problem of unemployed youth between the ages of seventeen and twenty-two who are not in school. Working with these young men and women presents a new kind of problem to the agency. In the Southwest and the Rocky Mountain area the ethnic group historically called Spanish-Americans is the largest group in the culture of poverty. The problem, then, is to train middle class Anglo counselors to understand better the administration and supervision of Youth Opportunity Centers whose clientele would be primarily from a culture and a residential area with which they would not likely be familiar.

The participants for whom the Institute was designed were members of the civil service who had had training and experience in working with the placement of the non-disadvantaged youth usually of middle class and often of Anglo origins.

The objectives of the program were to help counselors to acquire an awareness of the nature of the problems facing the youth. This involved understanding the disadvantaged: their home backgrounds, their upbringing, their difficulties with the traditional educational system, the degree to which they share the values with their more advantaged peers and the factors that stand in the way of the motivation to achieve means to fulfill these values. We also sought to give special skills to persons who have administered and supervised counselors in the field.

Perhaps the principal objective was to sensitize and facilitate their ability to learn from the actual field experience ahead of them.

The Institute originated in the following way: The special services supervisor of the Colorado Department of Employment in Denver, Colorado, suggested that the Extension Division of the University of Colorado propose a special training program for employees of the Departments in Montana, New Mexico, Wyoming, and Colorado. The assumption was that the school would be held on the campus of the University of Colorado using pretty much the graduate personnel and guidance staff. Members of the Sociology Department were asked by the Extension Division if they would be willing to undertake the project. They agreed to do so and after some investigation and consultation came up with a proposal that specifically differed from the pattern initially stimulated by the government in three ways: (1) The University suggested that the school be held in downtown Denver in the environment where the life of the disadvantaged was evident; (2) it was proposed that the future clients of the Opportunity Center counselors--mainly unemployed school drop out youth as well as some ADC mothers and chronically unemployed men--be employed as basic instructors along with professional academic persons for the instructional staff; (3) the program would be supplemented by actual field trips in which the participants would engage in role playing and in direct observation.

The proposal was submitted to the Labor Department in Washington where it was decided that it would be worth-while to try it out on an experimental basis. The University of Colorado agreed that it would be able to organize the program so that it could start fourteen days after the approval of the program by the Department of Labor. Perhaps the novelty of the format contributed to the ease with which the University was able to recruit a very able staff on such short notice. It is believed that the environment of a "skid row store front" as a classroom was a necessary prerequisite to the excellent performance of the basic instructors who might otherwise have been threatened by being asked to tell their stories in an unfamiliar institutional environment.

## PART I - PROPOSAL FOR EMPLOYMENT SECURITY INSTITUTE ON MANAGEMENT AND OPERATION OF YOUTH OPPORTUNITY PROGRAM

### I. Presenting the Problem

The most wasted resource of our nation today is the several million out of school, out of work youth who stand poorly prepared to enter adulthood as productive citizens but who will enter it nonetheless. Their horizons are meager. Their hopes have frequently turned in quiet retreat or noisy opposition. Our urban centers have little to celebrate about and much to fear when they assess the future of many of their young citizens. The disadvantaged youth today stand out in greater clarity than ever before in our nation's history. Their revolt is disorderly, frustrated, unclear and complex. We know a good deal about them The major challenge of today is to translate this knowledge into effective solutions to their individual plights and that of the community they inhabit. One solution is to assist these youth to prepare themselves for and find employment or other meaningful roles which may give them a stake in an otherwise illusive society. This job may be a first step toward other entries into useful social interaction.

This is a proposal to train personnel in state agencies of the Employment Security Program for managerial and staff positions in the Youth Opportunity Program. It is designed to break with traditional approaches for intensive education to specialized groups. It will break with tradition in the following ways:

a. The Setting: The trainees will learn in a natural setting of poverty and disadvantage. They will study in a rented building on Larimer Street in Denver (the main artery of Denver's skid road). The natural laboratory will provide them with a constant look at despair, conflict, disadvantage and poverty.

b. Involvement with the Setting: They will be housed in a respectable hotel (The Oxford Hotel) near Larimer Street and adjacent to Union Railway Station at the end of Seventeenth Street. They will have meals in the area and be encouraged to interact with those who live in these areas. A surprisingly large number are youth who drift toward this section of Denver.

c. Getting in Touch with the Disadvantaged: The trainees will be encouraged to seek out part-time employment in the area. The experience of searching for employment will give them new insights into the resistances, the barriers and the plight of the disadvantaged.

d. Innovations in Teaching: Perhaps one of the most creative plans in this program is to have part of the teaching done by the families and individuals of poverty. These will be recruited from minority groups and poverty stricken Anglo families. Some will be youth of the area and circumstances. Through interviewing, group interaction and sensitivity experiences of a new nature, the trainee will interact on a first hand, vis-a-vis basis with those who know and feel most about being poor, why they are poor, and why their prospects are dim. The avenues are open to this staff for the recruitment of these "basic instructors." Skilled interviewers are available to direct these group sessions.

## II. Suggested Curriculum For the Three Week Intensive Course

In keeping with the requests of Employment Security, the curriculum will devote two-thirds of its content to "understanding the socially deprived young people from the economically disadvantaged sections of the city. The remaining one-third will be devoted to administrative principles for the management of the Youth Opportunity Program."

1. The Behavioral Science Sequence: Content will be derived from the social and psychological sciences -- principally: sociology, anthropology and social psychology. These lecture-seminars will present this content with radical departure from the traditional pedagogical form. It will provide the conceptual and theoretical content on poverty and social and personal deviance with reality. For instance: seminar sessions may be entitled:

A. Sociology of the Culture of Poverty

a. Dimensions of poverty and disadvantage
b. Deprivation - being alone and unable
c. The time continuum: unfulfilled futures
d. Image decay - mirrors in back rooms
e. Opposition ideals (the quest for affluence)
f. Replacements for boredom
g. Masculinity - man as no-man
h. Urban living - people on people
i. I come from a long line of dependent people
j. Joblessness
k. People on the move - rootlessness

B. Social and Personal Deviance - Causation

a. Individuals at odds
b. Social and cultural dimensions
c. Alternatives - social and psychological cloture to some forms of deviance

C. Being Different

a. How does it feel?
b. Stigmas
c. Near-groups in opposition (breaking the law)
d. Being different and deviant - the double trap

D. Foci -- Ways Out

a. Breaking out of the system
b. Potentials for life - how to find them
c. Restoration of decent self image
d. Motivations for the disenchanted
e. Using the skills of inclusion
f. Expanding opportunities - within and without

E. The Administrative Principles for the Management of the Youth Opportunity Program. (The content will focus on human management techniques specifically designed for those staff members who will be dealing with disadvantaged youth.) It will be done very much as the content for the other section of the curriculum with emphasis on sensitivity experiences, group dynamics and role playing. This content will not be given in straight lecture sessions but rather through trainee, instructor interaction.

a. Formation of a social system - then running it
b. Administration and Policy
c. Decision-making
d. Leadership and charisma

The University of Colorado will grant graduate and undergraduate academic credit in the Department of Sociology to those students who desire to complete certain requirements in the pursuit of graduate work.

It is important to emphasize that the content of the training institute will be appropriate to several occupational positions in the Youth Opportunity Program, namely: program managers, assistant managers, and supervisors.

Planning Symposium: We will hold a Planning-Evaluation-Symposium at the Brown Palace Hotel Friday, 15 September, 1964, of some twenty community "actives" representing various sections of the community, for one day.

This group will provide an opportunity to reality - check the proposed curriculum for the Institute.

## Chapter IV
## Consulting the Community--The Symposium

We recognized that there were many lay and professional persons in Denver, who by virtue of their close daily contact with community problems, could assist the University to develop a more comprehensive understanding of the city's poverty areas and the problems of area residents.

We believed that it was essential to good programming to really check the planning assumptions by asking a group of knowledgable persons to meet with us to tell us their perceptions of the problems uncovered in the operation of public and private agencies, the schools, government, and labor organizations. We found that, even on short notice, many very busy persons were willing to give us a day of their time to discuss community problems and review the proposed program.

The meeting, which was conducted at the Brown Palace Hotel proved to be extremely beneficial. Many of the uncertainties about program content were clarified and the emphasis upon the problems of the Spanish surname group which develop in the discussions aided planners to focus more attention on this minority in the school.

The Symposium served the significant function of informing the participants of the purposes of the Colorado School as well as testing the efficacy of the approach. This, too, was important for the Employment Councilors in the Denver area would have to work closely with many of the agencies and organizations represented in the Symposium if Youth Opportunity Centers were to be successful. In addition, it gave the participants an opportunity to update themselves on current programs and plans which other agencies were developing.

Finally, the meeting was interesting because it was relaxing and informal. Participants were in no rush to leave although discussions lasted an hour and a half longer than scheduled. In fact, the participants gave every evidence of enjoying the opportunity to meet on the neutral ground provided by the University to discuss freely the problems and solutions in a situation in which they were not required to either make commitments for their respective agencies or necessarily to present the formal positions for the organizations with which they were associated.

The summary of the Symposium follows.

PLANNING SYMPOSIUM ON THE

YOUTH OPPORTUNITY PROGRAM FOR DISADVANTAGED YOUTH

Brown Palace Hotel
10 a. m.
Tuesday 15 September 1964

Topics for Discussion

1. What do you perceive to be the structure of urban poverty in Denver?

2. How have social services been effective in attacking the poverty problem?

2-a. Why have not social services been more successful?

3. How have employment services been effective in attacking the poverty problem?

3-a. Why have not the employment services been more successful?

4. Why have not schools and universities been more successful?

5. How do we communicate an understanding of the structure of poverty to the people?

6. In what ways do the pluralistic structure of interest groups and community agencies assist in the solution of the poverty problem? --- prevent problem solution?

7. What do you perceive to be realistic ten-year goals for a war on poverty?

## ROSTER OF SYMPOSIUM ON THE STRUCTURE OF POVERTY

Stanley W. Boucher, Assistant Director, Mental Health Planning Project, Colorado Department of Institutions.
Jim Burress, Vocational Rehabilitation Administration.
Juan Cordova, Social Welfare Worker, Jefferson County Schools.
Galloway Denny, Anti-Discrimination Commission.
Jack Gaskie, Rocky Mountain News.
Rudolph Gonzales, Community Leader.
Carl Haberl, Special Services Supervisor, Colorado Department of Employment.
Neal Hadsell, U. S. Department of Labor.
Daniel Hoffman, Manager of Safety, City and County of Denver.
Raymond Lamb, U.S. Department of Labor.
Kenneth Oberholtzer, Superintendent, Denver Public Schools.
Ted Rubin, State Representative.
Herrick Roth, Colorado Labor Council, AFL-CIO.
Mort Stern, Denver Post.
Bernard Valdez, Denver Welfare Department.
Dick Vogel, Colorado Department of Employment.
Goodrich Walton, Executive Assistant, Division of Youth Services, Department of Institutions.
Larry Weiss, Denver Post.

University of Colorado Roster

William T. Adams, Western Interstate Commission for Higher Education.
Lois Badger, Extension Division.
Elizabeth Critchlow, Extension Division.
Frances Hawkins, Kindergarten Specialist.
Howard Higman, Department of Sociology.
Robert Hunter, Western Interstate Commission for Higher Education.
John Tomson, Extension Division.

## Preface

While poverty itself may appear simple, the condition of being poor; the explanations of it in economic, social, psychological and political terms are complex and too often obscure. This theme ran throughout the symposium on poverty and the proposed attack on poverty through the Economic Opportunities Act recently passed by the United States Congress.

The specific aim of the symposium was to have the leaders of Denver's agencies, institutions, newspapers, and lay citizenry discuss a proposed training program to be conducted by the University of Colorado. The training is planned for thirty-five employment security employees who are slated to work in the Youth Opportunity Programs in the Rocky Mountain Region (Montana, Wyoming, Colorado and New Mexico).

In order to develop a realistic and meaningful intensive course, it was decided that such a symposium could help to establish goals. It was hoped that the symposium would assist planners:

1. To acquire insights into curriculum, training skills, and methods to be used.

2. To provide an opportunity for community leaders to share information about community resources and exchange points of view.

## I. Structure of Poverty in an Urban Setting

While the central geographic focus of the discussion was obviously Denver, many of the participants agreed that poverty in most urban areas is essentially similar. Some unique characteristics for Denver were noted:

1. A change has occurred in the past three decades in several occupational areas. Specifically, mining and agriculture have declined, leaving many persons unskilled and unemployed.

2. An ethnic group which receives little national attention provides a disproportionate number in the ranks of the unemployed in the Southwest, namely the Spanish surnamed minority group. (A separate section is devoted to this ethnic group and its concerns.) The Spanish-American appears to have major problems in the labor market. Unlike the Negro and Anglo, he has few successful models to emmulate in such professions as medicine, law, higher education, business, industry, the arts, drama, music, architecture and civil service in the Denver area.

3. This urban setting has attracted a large number of rurally-oriented persons who find difficulty in adjusting to urban life.

4. Several neighborhoods in Denver reflect economic depression as well as physical blight and social disorganization. While urban renewal has been of some help, problem areas have been physically moved on and out rather than eliminated.

## II. Strengths and Weaknesses of Social Agencies and Institutions

It was noted that middle class values may provide a systemic inertia against any attempt to solve the problem of poverty both because the existence of the poor is a requirement for the definition of middle-class achievement and because the poor provide economic services.

For many years, public and private social agencies and institutions have been in existence, working primarily toward the elimination of social and personal problems of the citizens. Undoubtedly, poverty has been one of the crucial disruptions of society. Careful and objective reviewing of several principal organizations was taken during the symposium. A brief review is now given with two points in mind: hailing the strengths and exploring the areas of weakness.

### WELFARE

In the west, and in the Rocky Mountain states in particular, the vast majority of welfare services are public. Because of this fact the discussion focused on the public welfare agencies. Many persons have been able to subsist through welfare programs such as Aid to Dependent Children, Aid to the Needy Disabled, General Assistance, Old Age Pensions, etc., but a large number have not been able to achieve independence from these public programs.

A long discussion of the nature and goals of welfare programs in this country prompted concern with several of the Welfare programs, notably Aid to Dependent Children. Some participants expressed the criticism that as the ADC program is presently executed, it tends to encourage dependency rather than self-sufficiency. The present program discourages family unity or restoration. The father of a child is prohibited from remaining in the family, thus precluding recovery and making crisis permanent. If the father reappears, support is withdrawn. The family may need support for a period to be able to recover.

Although some welfare departments have programs which encourage families to try to gain self-sufficiency through part time work which does not penalize the recipient (incentive budgeting), most welfare programs do not, in reality, accomplish this goal. They continue to conduct programs which actually reinforce dependency and negate efforts for self rehabilitation. They actually operate against the normal family relationships. Many cities have the midnight raids on ADC homes to flush out the male "intruder."

The discussion pointed out that welfare programs were largely geared to provide financial assistance in the past. While the aim is to give services to individuals and families to assist them to become self-sufficient, qualified workers are scarce. The achievements of the agency working with the hard-to-reach and chronic recipient have not been impressive. Little, if any, attention has been paid to the vocational and occupational needs of clients. The services have frequently failed to consider the total situation of the client in need of varied and comprehensive services. A redefinition of the function of welfare is underway.

## SCHOOLS

In almost every meeting held today on current social problems, keen attraction is drawn to schools--notably their failures to do much about school drop-outs, delinquents, vocational education, and technical education. This symposium was no exception.

The schools, while obviously providing an adequate education for most persons in our society, also fail to adapt to certain changing social situations. Frequently the drop-out is not challenged sufficiently by the school.

It was pointed out that twenty years ago the schools were urged to be concerned with vocational education (because at that time there was a great need for persons so educated). They took little heed. Today they are beginning to show interest, but are late, perhaps too late, because due to automation jobs for which vocational education prepares persons are being eliminated from the labor market.

With relation to poverty, it was pointed out that public education is not really "free" as is boasted. With mounting school fees, extended affluence, socialization of the youth culture, those from families of economic disadvantage or minority status often feel excluded, lose interest in, frequently leave, or are pushed out of school. Higher education for these children is hardly even an aspiration, infrequently a reality.

During the discussion, a new point of view--rarely given much public attention--on school drop-outs appeared. Bluntly, it suggests the premise that there is no such thing as a school drop-out--rather he is a school push-out. The school system and its allied institutions are actually the locus of failure. Except for certain aspects of the school system, chances are that few youngsters would leave school prior to their high school graduation. For instance, young people are pushed out of school because the school is not really "free." The economically disadvantaged are pushed out because they cannot afford to remain. They cannot keep up the material pretenses and are punished psychologically and socially.

A second frequently mentioned factor is that youth drop out because they are academically incapable of completing the work. The school rarely sees that they might modify the curriculum to keep the youngsters. They might look at their own system of rewards and motivation. They might find out that in reality their reward and motivation system fails to reach a large number and actually works against some. This system pushes out many.

The troublesome child is frequently pushed out because the school does not have a way to work with him to keep him.

## LABOR AND EMPLOYMENT

While no one attempted to present a long-range view of the future of job opportunities, the structure of the labor market, and prospective occupational shifts, the prognostications were somewhat gloomy. Automation will undoubtedly have profound impact on society in the near future.

As a result of these imponderables, vision is needed. Well thought through goals for job training are essential. This symposium was guardedly optimistic about the future in this respect. One person suggested immediate

preparation of training programs for service skills as opposed to craft and trade education.

Another indicated that, although he bemoaned the fact, it seemed evident to him that many persons would be necessarily sent through numerous retraining programs in the course of their stay in the labor market. Their skills would constantly need re-tooling.

No one advocated the notion of "make work," but if the future outlook for the labor market indicates a nation with few industrial, factory, manufacturing laborers, emphasis necessarily should be placed on service occupations. The experts will need to discover ways in which "style of life" can be created which will make work in the service fields meaningful, creative, useful and challenging. The present concepts of work and leisure need to be overhauled with serious attention being paid to service tasks and the creation of their occupational roles and models.

A great many persons and families are in poverty because jobs are not available, they are improperly educated or trained for work, economic depression strikes their area or occupation, or personal and social deviation renders them unfit for work or makes them socially unacceptable. Some are in poverty simply because their community closes doors to work which could put them on a decent subsistence level. The doors are often closed primarily because of their race or ethnic origin.

The mass of the chronically unemployed needs to be studied and defined carefully. Who are they? Every community must find out about this group within its own environs.

Evidence points to the fact that many are youths between sixteen and twenty-five who have not received an adequate preparation to enter adulthood. Minority groups have disproportionate numbers when compared to the general population. Social deviants such as ex-convicts, addicts, alcoholics, emotionally disturbed and mentally retarded youth swell the ranks of the unemployed. They are quite likely to be chronically unemployed or underemployed. Increasingly, signs indicate that all too often these deviants are youthful and defeated.

## A PROPOSAL

It was proposed that a straightforward approach is needed if the chronically unemployed person is to receive effective assistance to become self-sufficient. Three points were outlined:

1. Education for living or resocialization is vital. This plan includes all the skills and know-how of the helping professions to rehabilitate the person who needs it: i.e., the person who cannot work because a multitude of things interferes with the functioning in the social system or the occupation complex.

2. Job-training should begin by preparation for intermediate range jobs--those within reach with immediate rewards. Later he can be trained for other, better occupations if he has sufficient motivation. Continued on-the-job training is essential.

3. Subsidization while being trained, re-trained, or rehabilitated is essential. This proposal was espoused by only one participant and general support appeared. The proposal is not an answer to relieving poverty in general, forever. It presents a plan and a point of view and is worth noting.

## LAW ENFORCEMENT

At first thought, one might wonder why law enforcement is considered in the broad context of this symposium on poverty. Actually it is included because there is ample evidence to prove that being poor puts one at a disadvantage on several counts. A point can be made that differential justice is the case for many who are poor. In Denver there is vocal protest against alleged differential justice and police brutality toward minority group persons. The contention is that the police treat the economically disadvantaged, minority group person differently than he does the Anglo. While the police deny this, several groups continue to make the charge and seek to collect evidence to prove their case.

The implication here is that if such discrimination is real, it further disables the minority group person and compounds his already disadvantaged position.

It has been stated that the police officer is supersensitive to certain social conditions as he performs his duties. In other words, the situation he finds himself in may define his behavior. An example is as follows: the patrolman in the area of a city with a high crime rate, intense physical blight, a high percentage of minority groups, and other negative conditions is likely to react to behavior in this set of circumstances quite differently from the way he might act in another setting. He is likely to anticipate trouble here. He is likely to be more suspicious of anything unusual such as groups gathering, a drunken person, a speeding car, a fight. The charges of police brutality and differential justice continue. The committee against police brutality stresses the charge that some persons are more vulnerable to abuse which occurs and from which the police are commonly exonerated.

## THE CHANGING ROLE OF THE POLICE

In an effort to change the image of the police, the Denver Department is planning, or has begun, to institute several programs. These are basically designed to get the law enforcement officer in closer touch with the community and reduce the emphasis on the authoritarian role. In some ways, these programs will tend to change parts of the usual role of the officer. Briefly listed they are:

1. A Police Athletic League

2. A Law Enforcement Explorer Scout Program

3. A Community Relations Program

    a. meeting with ADC mothers
    b. meetings with housing authority tenants

If these new directions for the police are to be realized, several participants suggested that changes in education for law enforcement services are essential. A university curriculum drawing heavily from the behavioral sciences is recommended. Police Academy training is severely limited. Plans are underway in Denver to develop a law enforcement sequence in the University of Colorado Extension Program.

## III. The Spanish American -- Special Emphasis

Because this ethnic minority has a disproportionate number in the ranks of the unemployed in Denver when compared with the general population, special mention is given to the social, cultural, and political factors surrounding this group. Extended discussion was encouraged in this symposium because of the urgency of the problems and also because of the desire to include specific content on the Spanish American in the intensive training program for the employment security trainers. Several spokesmen for this minority were present and vocal.

While the Spanish American group comprises only ten percent of the state's population, it is a vulnerable group in terms of such indices as juvenile delinquency, welfare recipiency, school drop-outs, unemployment, poor housing, poor health, and others. In explaining these conditions, a clear and usually undisputed fact is that full participation in the society is denied this group in the southwest. While overt segregation rarely occurs, de facto segregation is a reality. The opportunity system is closed in many ways. As a minority group, the Spanish Americans have not reached a degree of assimilation comparable to other ethnic groups in the long history of this "melting pot" nation. In some ways, cultural differences may explain the slow assimilation. At any rate, it is necessary to understand this group if effective programs are to be constructed to eliminate poverty and to provide new opportunities for youth.

### ORIGINS

The Spanish surnamed persons in the Denver area have three distinct cultural origins. Some are descendants of Spaniards who settled in the Rio Grande Valley of New Mexico in 1598 or thereabouts. Very few of them have retained their distinct Spanish heritage.

The second cultural origin of the Spanish surnamed persons in Denver is in this same region of northern New Mexico. The Spanish settlers intermarried with the American Indian peoples of the area. With this intermarriage came the diffusion of these two cultures. Thus, these traditions spring from a different cultural origin.

The third cultural origin is the Mexican immigrant who has chosen to leave his native land of Mexico and migrate to the United States, either by way of Texas or New Mexico.

There are many similarities between these peoples, but some differences also.

While in the beginning there was little assimilation following World War II, the tide changed. That this group has had a feeling of suppression during the years is an obvious fact.

At one time, the language barrier was real in this group's struggle for inclusion in the dominant culture, but today it is a problem only for the older persons and for those from rural areas.

There is much disagreement between leaders and scholars about the culture and the characteristics of the people from these diverse ethnic traditions. Several generalizations were accepted. Others might reject them.

In Denver there are varying degrees of assimilation. Some Spanish surnamed persons have crossed over and hold little if any psychological identification with their cultural origins. Others hold some identification while others identify almost totally with their cultural origins.

Some characteristics of the Spanish American culture are as follows:

1. An intense pride, honor, and a feeling of worth.

2. Strong family ties (an extended family with paternal dominance).

3. Deep immersion in the Catholic faith.

4. Some acceptance of "sea por Dios" or God will take care.

5. Little enthusiasm for formal education.

6. Strong in-group feelings with extensive group socializing.

7. A spiritual rather than a materialistic orientation.

8. A concern for the past and present with less regard for the future.

These can only be accepted as generalizations, but are useful in themselves.

One spokesman felt that, if a close analysis is made of the vulnerability of the rural migrant to the urban area, we must consider two factors:

1. The extended, closely-knit family may break down in urban living. Also, many Mexican nationals travel alone. Often they are distraught when away from their families. Other disruptions of the family unit tend to cause serious problems of deviancy from the cultural norms.

2. The loss of the masculine image in the family--either through actual loss of the father (dominance) or psychological loss of status in the role, namely through an inability to sustain this role in an urban exclusive society.

At one point it was suggested that perhaps all families in slums and disadvantaged areas may experience similar problems with similar social or psychological repercussions, regardless of their cultural origins.

When these factors are considered and the fact is accepted that the Spanish American group has been a vulnerable one in this region, caution is needed in planning for the elimination of economic problems. One spokesman warned of dangers in implementing the many-faceted poverty programs unless one quality of these peoples is checked:

The quality of dependency.

He felt that offsetting the quality of pride, which is major, is the opposite quality of dependency which appears to permeate the culture. Those in the helping services must always guard against creating dependency in their clients. Rigorous safeguards are needed for the Spanish Americans due to this possibility of creating crippling dependency through the new welfare programs.

This long discussion was prompted by the general concern for this topic by the participants. Further implications will be stated in the summary.

## IV. Proposed Demonstrations: New Directions in Combating Poverty and Enhancing Economic Opportunities

In several specific areas, demonstrations are proposed or currently active. These demonstrations have significant importance in the present effort to attack poverty.

### THE SCHOOLS

For several years the Denver Public Schools conducted a comprehensive study of the quality of educational opportunity in the schools. The superintendent of schools reported that the study group found major problems particularly among the city's disadvantaged children.

A high risk group was found among the sixteen to twenty-five year olds who had left school prior to completion of high school. They were frequently unemployed or underemployed. A large percentage of these came from economically depressed families and/or were from minority groups.

The proposal is to establish a Metropolitan Youth Education Center supported by the Denver and Jefferson County School Boards. Briefly, this center will provide on a voluntary or referral basis the following:

1. Counseling and guidance
2. Basic and general curriculum
3. Vocational and technical training

### LABOR

The Colorado Labor Council proposes and is in the process of establishing a Job Opportunity Center which will focus on providing services to the older, chronically unemployed. Its director outlined the program as one which will attempt new approaches to resolving the social and economic problems of approximately 350 families in Denver's and Pueblo's urban and immediate rural areas. The services are to be family centered. They will be placed in the natural areas of the city where unemployment and incidences of social problems are highest. They will be partially staffed by "technicians." Youth from the neighborhoods will be hired to act as go-betweens and interpreters.

## WELFARE

The Director of the Denver Department of Welfare has stated that he is interested in getting a local university to do an experimental educational program geared specifically to educate those who are in need of continuing education. The student population he proposes is a high risk one: ADC mothers, chronically unemployed persons, ex-convicts and delinquents and other personally deviant and/or disadvantaged persons. They would receive education primarily focused around re-socialization, serviceability, training for bolstering self images, etc.

It was stated that while these programs are positive and constructive, some words of caution are necessary. The job of coordinating these efforts is gigantic. Fragmentation and needless duplication and conflict could occur. The trainers from the Employment Securities Office should be introduced to this possibility.

Further, it was stated that many of these proposals had earlier counterparts in the thirties. Some failed then. It is incumbent upon the researchers today to review the past experiments and learn from them. They should also use the vast reservoir of new knowledge in the behavioral sciences which is applicable to many of these social experiences.

## SUMMARY

There was apparent discontent among the leaders of the social, economic, educational, political and allied organizations in attendance. The unique dimension was the vital desire to take a new look at old problems and find small, large and comprehensive solutions. Persons appeared no longer content with the traditional approaches. At the same time reality was provided. The issue was raised: at what point would you want to junk all the old agencies and practices and start anew? You would always have the risk of the older network eventually undermining the new when the freshness disappears. Furthermore, we have not made a remarkably new "discovery of the helping services." A healthy reservoir of skills, knowledge, and methods already exists. The application of these has frequently been sterile in all too uncreative settings. Herein lies the challenge.

## CONCLUSIONS

Putting a cap on this lively, articulate, and tradition-breaking group is no mean feat. Much of what has already been written is in reality a series of conclusions. At this point, it may be useful to restate the major items as they relate to the proposed training demonstration for the personnel in the Youth Opportunity Programs. They are:

1. The training should occur in the indigenous areas of poverty and social disorganization.

2. Faculty should include some of the persons from these areas themselves.

3. Content should focus on specific knowledge about minority groups.

4. While Denver and Albuquerque are essentially the only large urban settings in the five-state region from which the trainers will come, content on urban poverty and urban services is highly desirable. Specific attention must be paid to the impact of the urban way of life on rural minorities as they gravitate toward urban centers.

5. Political, economic, social and behavioral science content is needed, presented in such a way as to challenge the trainers rather than confuse them.

6. Social services skills must be given in a dynamic way, focusing upon the complexity and variety of services.

7. The legal aspects of social and personal deviancy must be explored.

8. Awareness of the multi-service structure in the helping agencies is necessary for effective work at the community level.

9. The sense of community--what it means, its structure and function--should be explored thoroughly.

10. Everything necessary to solve the job opportunity problem as defined today is probably present in the Denver community. It will take ingenuity and financial support to resolve these problems effectively. The community has many of the resources already.

## Chapter V
## The Schedule and the Faculty
## Staff

PROJECT DIRECTOR

Howard Higman, Professor of Sociology, University of Colorado, Boulder, Colorado. Telephone: 303-443-2211 (6483)

ASSOCIATE DIRECTOR:

Robert Hunter, Sociologist on leave from the Western Interstate Commission for Higher Education to the University of Colorado. Telephone: 303 443-2211 (6483). Oxford Hotel: 303 825-7221, Denver, Colorado.

CHIEF ACADEMIC CONSULTANT

William T. Adams, Sociologist, Western Interstate Commission for Higher Education, Boulder, Colorado. Telephone: 303 443-2211 (6342).

ADMINISTRATIVE ASSISTANTS:

John Freeman, Graduate Student in Sociology, University of Colorado.

Patrick Jobes, Graduate Student in Sociology, University of Colorado.

RESEARCH CONSULTANT:

Robert Hanson, Director, Bureau of Sociological Research, Institute of Behavioral Science, University of Colorado.

## FACULTY

William T. Adams, Sociologist, Director, Juvenile Delinquency Programs, Western Interstate Commission for Higher Education, Boulder, Colorado.

William Bernthal, Associate Professor of Management, School of Business, University of Colorado, Boulder, Colorado. Dr. Bernthal is a consultant to business and industry and has assisted in conducting courses for the U.S. Chamber of Commerce and other private and public groups.

Rudolph (Corky) Gonzales, Community Leader. Mr. Gonzales is a member of the President's National Citizens Committee for Community Relations and he is a member of the Advisory Committee to the Civil Rights Commission.

Daniel Hoffman, Attorney, Manager of Safety, City and County of Denver, Colorado.

Carl Hollander, Director of Recreational Therapy, Fort Logan Mental Health Center, Denver, Colorado. Mr. Hollander is skilled in group dynamics and psycho-drama.

Paul Jacobs, Labor-Management Consultant, San Francisco. Institute of Industrial Relations, University of California, Berkeley. Consultant to Sargent Shriver.

Richard Jessor, Professor of Psychology, University of Colorado. Dr. Jessor is consultant to the Federal Correctional Institution (Youth Facility), Englewood, Colorado. He has also been a co-director of the NIMH Triethnic Study in the Southwest.

Clark Knowlton, Chairman, Department of Sociology, Texas Western College, El Paso, Texas. He has done much research in near gangs in Spanish-American Communities of New Mexico. He speaks Spanish fluently and has a ready entry into the Spanish Youth culture.

Salvador Ramirez, Assistant Director of El Paso Boy's Club. He has extensive experience in working with underprivileged Spanish-American children in the El Paso slums.

Reyes Ramos, Sociologist, Monte Vista Public Schools, Mr. Ramos works with youth in Monte Vista with specific interest in continuing education.

Sam Rosenberg, Producer, National Education Television, New York. Mr. Rosenberg has produced documentary television programs and films including studies of economically-dislocated communities.

Rudy Sanfilippo, Program Director, Delinquency Prevention Program, University of Southern California. Mr. Sanfilippo is a specialist in public administration. He works on many projects for the Youth Studies Center, USC, and the Greater Los Angeles Youth Opportunities Board.

Max Scott, Sociologist. Treatment Director and Research Associate, Pine Hills Delinquency Experiment, Provo, Utah. Brigham Young University. Mr. Scott is interested in the application of social theory in the treatment of delinquent adolescents in a community setting.

Dorothy Sherman, Professor, Department of Education, Wichita University, Wichita, Kansas. Dr. Sherman has many years of experience training counselors to work with youth. She recently returned from a month-long traveling team training program in Alaska for health, welfare and corrections personnel.

Mary Sneed, Child Welfare Worker, Denver Department of Welfare. Miss Sneed is an outstanding child welfare worker who has direct contact with clients. She is an excellent teacher, firmly based in reality content.

## Visiting Faculty

George Bickel, Legislative Representative, Farmers Union.

Neal Hadsell, Regional Director, U. S. Employment Service, Denver, Colorado.

David Hawkins, Professor of Philosophy, University of Colorado.

Peter Henle, Deputy Associate Commissioner, Bureau of Labor Statistics, U.S. Department of Labor, Washington, D. C.

Robert Schasre, Research Associate, Delinquency Prevention Program, University of Southern California.

Sunday, October 4

INSTITUTE PARTICIPANTS ARRIVE
Oxford Hotel, Denver, Colorado

Monday, October 5

| | | |
|---|---|---|
| 8:30 am | | REGISTRATION |
| 12:00 pm | Lecture: | GLIMPETS |
| | Speaker: | Robert Hunter |

## Chapter VI
## The Execution of the Program

### 1. Demonstrations -- The Basic Instructors

Basic Instructors were used as teachers in the Colorado School. They were selected from members of the community of the disadvantaged in Denver. The reason for using the indigenous people from poverty areas was to provide the class with an opportunity to learn directly from the poor. Basic Instructors were chosen from Aid to Dependent Children Mothers, young ex-delinquents, school drop outs, young men trying to enter the labor market, men who were adrift in the labor market with no attachments to the community, and young girls who had dropped from school. They came from ethnic and racial minorities. In all, there were sixteen who served as Basic Instructors for the Colorado School. They were urbanized people, but most of them had come from rural backgrounds. The Spanish Americans were born in the southwest, generally, and migrated to Denver while yet young persons with their families. The Negroes had roots in the rural south and had moved to the west with their mothers while children.

When the Basic Instructors were hired, they were told they would be teachers for the School. Each was paid ten dollars for his teaching and played a new role. This new role -- teacher -- appealed to the indigenous poor. The selection of the basic instructors was done in several ways. The major resource came from the Director of a recreation center -- the 20th Street Center -- in Denver. The Director had been in the Curtis Park area of Denver -- an area with a high density of poverty, disorganization, and crime -- for eight years. He knew the area thoroughly and the people who were asked to serve as 'teachers for pay.' The director drove them to the school and introduced them to the staff. From that point on, they were teachers for that day. No preliminary briefing was done. They taught spontaneously.

Another method of selection was to hire the Basic Instructors from the streets. During the demonstration -- watching the poor find work -- the students talked with persons on the street and hired them for that day. Two men were hired as teachers from the Slave Market and Denargo Market respectively.*

A third method was the selection of two basic instructors by one of the speakers. This speaker is a spokesman for the Spanish Americans in Denver. He hired his own instructors.

## Use of the Basic Instructors

If any one word could be used to describe the content of these sessions, it must be "spontaneity." Each teacher received very little prior instruction regarding his role as teacher. He came to the Colorado School, he met his co-teacher, and then the instruction proceeded. The basic format for this instruction was the interview. There were several reasons for this method. Straight lectures were out. The students were to get two things: content about poverty, youth problems, the life of the disadvantaged, and minority status in an affluent society on the one hand; and on the other hand, a demonstration of skillful interviewing -- individual as well as group. Since these two major items are necessary for the successful operation of youth opportunity centers, the students at the Colorado School were given a heavy concentration of both.

In the individual interviews, the Basic Instructors were asked questions and were encouraged to talk freely. After the interviews terminated, the students asked questions of the Basic Instructor. Finally, when all was completed, the Basic Instructors were paid $10.00, and thanked, receiving vigorous applause from the students. It was perhaps the only time in their lives they had been applauded by members of the middle class.

After the Basic Instructor left, the interviewer analyzed the session. He pointed out the significance of content, the interview process, the points of insight, resistance, threat, and the needs for support. A discussion was held in which the students at the Colorado School participated in the analysis of the interview. From the very beginning, the students were immediately struck by the fact that they had never communicated meaningfully with persons from poverty and disadvantage.

At one point, three co-instructors interviewed the Basic Instructors. Their interviewing approach was radically different -- one being client-centered with much inclusion of non-directive skills while the other two were largely interrogative and judgmental. The students learned a great deal from this session.

---

*The Slave Market is the vernacular for the Colorado Employment Service Office located in the "skid row" area for the hiring of casual and day labor. The Denargo Market is the office of the Colorado Employment Service for the hiring of farm labor.

One afternoon was spent in a group interviewing session. Four boys from ages 15 to 20 were hired as teachers. Three were Spanish American and one Negro. One boy was mildly retarded with a speech difficulty. He was purposely hired to demonstrate the double trap of being different and disadvantaged. He made an impact on the students. Co-interviewers handled this group session which lasted one hour and a half. The group responded freely.

## The Content of the Interviews

While a large part of the interviews did focus on revealing feelings and personal information about the Basic Instructors themselves, an even larger part was included on generalized reactions to such things as poverty, unemployment, the community, minority status, welfare, crime and education. They talked about the opportunity system in society.

They talked about themselves.

In so doing, the interviewer was careful to guarantee that their privacy was not violated. Each Basic Instructor was told at the outset that if any question was threatening, painful or too personal, all he need do was say, "I don't think I want to answer that or discuss it." In only three cases did an instructor say that. In one case, that of the ADC mother, an assumed name was used. She requested that. In the course of the interview, the interviewer did not probe into threat areas which aroused anxiety when he picked up the clue that the Basic Instructor was disturbed by the questions or dialogue.

Throughout, the interviewer made every effort to support the Basic Instructor. These were not therapy sessions. Over-commitment on the part of the client was guarded against. At one point, a Basic Instructor (a 26 year old young man) was shaking and obviously anxious as he talked about his sister's suicide. No depth probing was attempted. At another point, a boy in the group session became anxious as he discussed his father's death and his resultant misbehavior when the controls were lost in the family. No attempt was made to explore his guilt feelings as he discussed his hatred for the father who had brutalized him as a child.

The students at the Colorado School learned many things from these teachers. They learned that most of them had tried to find work but were unsuccessful. Most had dropped from school early because of the frustrations and resistances the school systems threw against them. Most had come from a simple rural background and were overwhelmed by urban living with its fragmentation and impersonalization. Most had poor self-images, saw themselves as unsuccessful, headed for trouble and failure. Most had felt pretty good about themselves at one time, but had been through a painful stretch of image decay. One girl remarked, "I have never felt proud of myself a day in my life." Another girl remarked, "Denver is hard on us. People don't stick together -- they are all for themselves here. People don't seem to care. It worries me because I see myself becoming just like all the others."

They were restless, homeless, chronically unemployed with few skills. They knew poverty and despair. They did not like what welfare did to them -- but some had taken it. For the most part, their lives had been marked by physical and emotional impoverishment. They related these feelings with great authority. They talked about how they felt as minority group people. What the police were like. They talked freely about the law and breaking it. Their vision of the future was dire. Most of them did not know about Manpower Development and Retraining, the Economic Opportunity Act, Vocational Rehabilitation, and the other programs designed to help the unemployed, unskilled, and disadvantaged. They talked about the lack of leadership among their peoples and the feeling that no sense of community existed. Throughout, it was clear that men of the lower socio-economic life had fewer opportunities for work than did their women. The men were cynical toward the church and school. They were also cynical toward family life. The women expressed their despair but often were the only means of psychological and financial support to their families.

These points came out in the interviews.

Further, it was clear as the Basic Instructors talked that they had much to say. The students at the Colorado School listened. To have success in assisting youth through the urban opportunity centers, the students knew their work would have to reach into the community. They would need to employ the skills of aggressive casework. These were explained and demonstrated to the students. They would need to use the resources of indigenous leaders from the community of poverty and disadvantage.

## The Impact

Evaluating the impact of these Basic Instructors upon the students at the Colorado School is not easy. The students listened, reflected, and formed new lines of identification to their future clients. They heard things rarely heard before. They saw lives in action which had new dimensions. They heard about poverty and disadvantage from persons who knew what they were saying -- young and old, men and women, boys and girls. These dialogues with the Basic Instructors added immediate reality to the academic content of the lectures during the sessions.

Time and time again the Basic Instructors said in their language, with feeling, the same thing espoused as theory by a lecturer. The group session was remarkable for this reason. It seemed as though it had been rehearsed to capitalize upon the preceding lectures about self concept and change. The parallel was striking. The group interview was spontaneous and all the more effective therefore.

Another point of impact from these interviews was that the people on the streets became more individualized. The setting for the Colorado School, as pointed out earlier, was on the main artery of skid row in Denver. The people there were different in the eyes of the students after they heard them talk in the interviews.

A further point was the fact that the content from the young persons and the older ones was not dissimilar. The things they said were strikingly alike. This does not mean that the older were immature and childlike or the younger were more mature than their years. Perhaps it means that the differentation between youth and adulthood among the disadvantaged is unclear. It is clear in the middle class. Impoverishment, frustration, anger, and image decay are ingredients of the lower socio-economic people of poverty whether they be young or old. The opportunity structure is closed at all levels. These points were made clearly by the Basic Instructors and the students of the Colorado School listened and learned.

Note: Immediately following the Colorado School, the Colorado Employment Service commenced the development of an MDTA (Manpower Development and Training Act) literacy training program for the Denver area. The 20th Street Recreation Center was selected as one of the three major recruitment locations. Acquaintances made during the School assisted the rapid implementation of arrangements. Two participants who had met the Center's Director were assigned and a room was made available for their use. Five of the youths who had taught as Basic Instructors in the Colorado School were there first to sign up for the training program and they brought their friends with them. As of the writing of this report all are still participating in the program.

A brief extract from the interview with the Basic Instructor who was recruited at the Denargo Market effectively portrays the content that the participants received.

Extract from A Basic Instructor Interview

Intr. - Interviewer
B.I. - Basic Instructor

Interviewer: We have M -, who was down at Denargo Market this morning and some of you have met him and talked with him. I don't know M -, so we'll have to start this thing off informally. M -, could you tell us a little bit about what you were doing this morning when these people descended on you and brought you down here to Larimer and 17th Street?

Basic Instructor: Well, I was down there looking for a job. I was standing in front of the employment office and a guy asked me if I wanted to earn ten dollars to come down here and talk.

Intr.: Do you go down there very often?

B.I.: Well, I've been going down there about a month now -- a month and a week.

Intr.: How do you make out?

B.I.: Oh, I work about two or three days a week.

Intr.: Doing what?

B.I.: Oh, farm work, unloading a semi -- that sort of thing, or I work in the produce shed.

Intr.: What kind of money do you make in this situation?

B.I.: Oh, about a dollar and a quarter an hour, or a dollar an hour and sometimes by the semi, they're contracted at ten dollars a truck. It takes about two or three hours to do it.

Intr.: Have you ever had a job for a long period of time?

B.I.: Yeah, I got laid off. I was working at a mercantile company as a truck driver. I worked there for two years but I got laid off.

Intr.: Why was this?

B.I.: Well, they sold out and some other people took over, and these other people had their own crew.

Intr.: I see. Well, what did you do when you got out of work? Did you go someplace to try to find a job?

B.I.: Well, I just started looking around for a steady job. I go Monday and Tuesday looking for a steady job and if I don't find one, then I go down and stand in front of the employment office at the Denargo Market. I figure I can at least work two or three days out of the week.

Intr.: Are you married?

B.I.: Yeah, I'm married and have two boys.

Intr.: Have you always lived in Denver?

B.I.: Yeah, I was born and raised here.

Intr.: Can you tell us something about how you did in school?

B.I.: Well, I went up to the ninth grade. Then my dad passed away and I had to quit school and help my mother support the rest of my brothers and sisters.

Intr.: How many brothers and sisters?

B.I.: Eighteen.

Intr.: You had eighteen in your family?

B.I.: Yes, but half of them passed away before I was around.

Intr.: You mean through childhood illnesses?

B.I.: No, a couple had car accidents; one had heart trouble, the other one - she took Drano.

Intr.: Drano?

B.I.: Yeah, Drano. There are a couple of us in the family that are kinda nervous.

Intr.: How do you mean?

B.I.: Well, I don't know. I guess just nervous.

Intr.: You mean you get upset easily?

B.I.: Yeah.

Intr.: Like how? Can you tell us a little bit about this?

B.I.: Well, like now. I'm pretty nervous. (Laughter)

Intr.: Well, you're on the spot.

B.I.: Well, the one sister that took Drano, her husband drinks a lot, you know?

Intr.: I see.

B.I.: You know, she was real nervous. She smoked two or three packs of cigarettes a day and I guess she just couldn't take it no more so she drank Drano.

Intr.: Was it suicide?

B.I.: Yes.

Intr.: How old was she?

B.I.: About 30 I guess.

Intr.: Was she pretty desperate about everything?

B.I.: Well, her husband wasn't --he used to work but then he'd go out and he wouldn't come home more and more, go on weekends and wouldn't come back 'til Monday morning.

Intr.: Was she left taking care of everything?

B.I.: Uh huh.

Intr.: Now, when you mentioned that you get a little nervous it's natural enough

when you're in front of a group like this, but are there other times when you're nervous?

B.I.: No, even when I'm alone I get nervous.

Intr.: Even when you're alone?

B.I.: Uh huh.

Intr.: What is it?

B.I.: I don't know. When my wife goes and sees my mother-in-law I stay in the room and I guess I get nervous so I have to go outside and, like now when I'm not working, I won't go home until about 4:30, even if I don't get a job. I'll walk around and that.

Intr.: Why do you do this?

B.I.: I don't know.

Intr.: Do you like being on the move?

B.I.: Yes.

Intr.: It makes you relax?

B.I.: Yeah.

Intr.: When you have a job it makes you feel better?

B.I.: Yeah. I went to barber school for about four months right down here but I was too shaky they said and I had to quit. I was too nervous. I needed two more months to finish the course but I had to quit.

Intr.: Well, now have you ever been to a doctor about this condition?

B.I.: No, my mother-in-law's been trying to make me go now. She says I could go down and take some nervous pills but I don't want to do that.

Intr.: Have you been nervous like this for a long time?

B.I.: Ummm, I don't know. I guess ever since I can remember.

Intr.: Ever since you can remember?

B.I.: Uh huh.

Intr.: When you went to school did you feel this?

B.I.: Well, not as bad as now that I've grown up, but I still was nervous even when I was a little kid.

Intr.: In school?

B.I.: Uh huh. Like when I was asked to get up and read or something I'd just freeze up.

Intr.: Sort of like being afraid without being sure of what you're afraid of?

B.I.: Yeah.

Intr.: Has anyone ever helped you -- to make this feeling go away?

B.I.: No. My wife, well, she tries to make me go down to see a doctor, too, but I just won't go.

Intr.: Do you know why?

B.I.: I dunno.

Intr.: Have you always lived in the same place here in Denver or have you moved around quite a bit?

B.I.: Yeah, we've moved around quite a bit.

Intr.: What part of Denver do you live in?

B.I.: Now I live on the west side.

Intr.: How do you get over to the Denargo Market then?

B.I.: I walk. Takes me about an hour and a half I guess.

Intr.: To get over to Denargo?

B.I.: Uh huh.

Intr.: That means you have to get up pretty early.

B.I.: I get up at about 4:30, I guess.

Intr.: Do you do this every morning then?

B.I.: Yeah. Except for Monday and Tuesday. Except on Monday and Tuesday I get up about 6:00 and go out and look for a steady job.

Intr.: Are your children old enough to be in school?

B.I.: No, my oldest is about four.

Intr.: Do you know much about the young people in the community where you live?

B.I.: I know a few.

Intr.: What are they like?

B.I.: They just like to drink and goof around.

Intr.: Do you know why they do these things?

B.I.: I think that many of them like to do it for fun I dunno -- just like to go out and have some fun and they get in trouble.

Intr.: Do many young guys come down to Denargo?

B.I.: Well, in the summer they do, but not in the winter.

Intr.: Are they able to get work in the summer?

B.I.: Yes, just farm work -- picking beans, sugar beets.

Intr.: What kind of pay do they get?

B.I.: You mean the young ones?

Intr.: Yes.

B.I.: They pay 'em by the pound, or 75 cents an hour - something like that.

Intr.: Have you ever lived out on a farm?

B.I.: No.

Intr.: When M - was talking a little while ago he mentioned the people in this city don't get together very much. Have you noticed this, too?

B.I.: Yeah.

Intr.: Could you tell us what you think about it?

B.I.: Well -- everybody just seems like they're for themselves, ya know -- for theirselves.

Intr.: In what way?

B.I.: Well, ya know, ya go askin' for a job, they won't help ya out. Even if they need ya, they won't put you on. Like me, I think it's mostly because of my size, ya know.

Intr.: You think because you're small?

B.I.: Yeah. I got this one job in a warehouse handling 1500 pound bales of rags. He wouldn't give me the job, but I kept going back every week and so finally he told me I'll give ya a week, ya know, try ya out, and I stayed there a year.

Intr.: You proved to them that you could do this?

B.I.: Yes.

Intr.: When you're working like you are now do you ever think about something you'd like to get that might be permanent, you know? What kind of a job would you really like to do?

B.I.: No, I...I never (long pause.)

Intr.: If you had a real choice, what kind of a job would you like to do the most?

B.I.: (Long pause.)

Intr.: Did you like truck driving?

B.I.: Yeah, that's pretty good.

Questions from Students

Student: Do you have a chauffeur's license?

B.I.: Uh, no.

Student: Do you really feel like you have a choice of jobs?

B.I.: No.

Intr.: Did you used to have a chauffeur's license?

B.I.: Yeah, it...it expired.

Intr.: Was there any reason why you didn't --?

B.I.: No, I just didn't go down to get it renewed.

Intr.: Was there any reason why you didn't?

B.I.: No, I just kept putting it off and it expired.

Intr.: How old are you, M -?

B.I.: Twenty-six.

Intr.: What do your brothers do?

B.I.: Well, one's a crane operator and another one's a common laborer like me and another one works at _____ _____ and gets pretty good wages -- two-fifty an hour.

Intr.: Has he been working there for a long time?

B.I.: Yeah, quite a long time. Almost nine months.

Intr.: You mentioned that you quit school because your folks passed away.

B.I.: Yeah, my father passed away so I quit. I was past the eighth grade and could quit so I quit and got a job as a delivery boy at a drug.store. I used to get a hundred a month.

Intr.: How long did you do that?

B.I.: Oh, I guess about eight months.

Intr.: The money that you made, did it go to the family?

B.I.: Yes, I gave it to my mother.

Intr.: Was your mom ever on welfare?

B.I.: No.

Intr.: What do you feel about welfare?

B.I.: I don't think it's no good.

Intr.: Could you tell me more?

B.I.: Well, like he said, everybody gets lazier, ya know, just don't want to work. Lot of 'em get away with gettin' welfare and that and they don't really need it.

Intr.: Well, M -, what do you feel that welfare is for?

B.I.: Well, it's supposed to be for the ones that need it, ya know -- have a big family and ain't got no means of support. There're a lot of women that live alone and they get welfare and they need it but there're others that have another kid every day and uh, that isn't right.

Intr.: Have you ever met a welfare worker -- social worker?

B.I.: No.

Intr.: Never in your life?

B.I.: No.

Intr.: Do you know people who know them?

B.I.: Yeah, I know quite a few people.

Intr.: Well, what do they think of social workers?

B.I.: Oh, social workers are always puttin' 'em down and they're real nosy and that, you know.

Intr.: Nosy -- you mean they ask a lot of questions?

B.I.: Yeah, They give 'em money but that's about all.

Intr.: If we wanted to get information to people about manpower redevelopment and training programs and things, how would be the best way to do it?

B.I.: I don't know.

Intr.: Did you know about the manpower redevelopment and training program that you have heard about here?

B.I.: No.

Intr.: What kind of things do your friends do?

B.I.: Uh, swimming and that, go to the movies.

Intr.: Do you get together much with them?

B.I.: No, not with me and my wife. I do but uh, not me and my wife.

Intr.: What do you do when you get together with them?

B.I.: Oh, shoot pool and have a couple beers.

Intr.: What do your friends do?

B.I.: Oh, a large percentage of them are laborers like me. One of 'em is a welder.

Student: You had a job for more than a year. Are you eligible for unemployment insurance?

B.I.: Yeah, I - uh - am eligible for unemployment insurance.

Student: Are you drawing unemployment insurance now?

B.I.: No, I'm eligible but I'm not drawing it.

Student: Why not?

B.I.: I wanna wait till I get a steady job first.

Intr.: You wanna try to get a job rather than take unemployment insurance now?

B.I.: Yeah.

Intr.: Because you may really need it later?

B.I.: No, it's because I've gotta be doing something.

Student: Why do you suppose they have a program of unemployment insurance?

B.I.: I dunno.

Student: M -, since you were laid off, have you been to the employment service office?

B.I.: No.

Student: Do you know about the office?

B.I.: Yes.

Student: How come you haven't gone up?

B.I.: Well, I dunno. I never got a job when I did go up there. I got a better chance down here than I have up there.

Student: How much are you making a week now?

B.I.: About thirty dollars. Close to thirty dollars if I work three full days.

Student: Is that about as much as you get from unemployment insurance?

B.I.: I'd get about fifty-two dollars.

Intr.: Would it be easier for your wife to get a job than for you to get a job?

B.I.: Yes. Uh huh!

Intr.: It would? In what way? Can you tell us about this?

B.I.: I dunno. Women just get a job quicker in Denver than men specially

if the man ain't got no education or somethin'. Yeah, she can get a job right now, if I'd let her, but I don't want her to work.

Student: How old is your wife?

B.I.: About twenty-two.

Student: How much education does she have?

B.I.: She graduated from the eleventh grade.

Intr.: Uh - she can get a job pretty easy, but you can't. How's this make you feel?

B.I.: I dunno. Uh - she never has done it 'cause I won't let her work.

Intr.: Do you know any homes where the woman works and the man doesn't?

B.I.: Yeah.

Intr.: What are they like?

B.I.: Well, my sister and my brother-in-law -- my brother-in-law he stays home all day and watches TV and soon as my sister comes home he goes out. When he comes back she goes to work.

Intr.: How does he feel about this? Does he ever talk about it?

B.I.: No.

Intr.: Does this go on all the time?

B.I.: Well, I guess it's been going on for about nine months. I guess actually he likes it.

Student: M - , can you tell us a little more about how you feel about unemployment insurance?

B.I.: You mean why I don't wanna draw it?

Student: Yes.

B.I.: Well, I don't know, but I'd just rather be workin' than laying around the house.

Intr.: If you were getting unemployment insurance you wouldn't be able to come out here and go to the Denargo and get jobs like this. Is that what you're saying?

B.I.: Well, you ain't suppose to work. I think gettin' unemployment is something like getting on welfare. I mean its insurance and you earned it but it's just like gettin' welfare.

Student: Are you registered with the unemployment service now?

B.I.: You mean state?

Student: Yes.

B.I.: No, I'm not.

Student: Uh - your boys are kinda young now. How far do you hope they'll go in school?

B.I.: I hope they'll graduate and go on to college.

Student: Was school pretty hard for you?

B.I.: You mean when I was going?

Student: Yes.

B.I.: Yeah, it was kinda hard.

Intr.: When you were in school did you ever get any help in your homework?

B.I.: Yeah. My sister who used to live in Wyoming used to come visit for a week or so and she could help me.

Intr.: Did your mother ever help you with your homework?

B.I.: No.

Intr.: Can you tell us why not?

B.I.: Well, she only went to the second grade so she couldn't help me much.

Intr.: Did you ever have hopes for going on to college?

B.I.: Yeah, when I was in grade school.

Intr.: How about your friends? Have any of them gone to college?

B.I.: No, none of them.

Intr.: When you quit school was there a teacher or counselor or anybody that tried to keep you in school?

B.I.: No, when I quit I just quit and my mother went up and talked to the principal and explained to him that she needed my help.

Intr.: What did the principal say?

B.I.: Well, they wanted me to keep going but they had no choice but to let me go.

Intr.: Because you had already completed the eighth grade requirement in Colorado?

B.I.: Yeah.

Intr.: Now M - , you don't have to answer this if you don't want to but it might help us. Have you ever been arrested?

B.I.: Yeah.

Intr.: Could you tell us about it?

B.I.: Yeah. I was arrested for fighting when I was young and that sorta thing.

Student: Do you put that down on an application for work when you try to get a job?

B.I.: You mean when I fill out an application for work -- oh, yeah.

Student: Do you put it down as a police record?

B.I.: Oh, no.

Intr.: You mean you don't actually have a police record. That was just when you were young.

B.I.: That's right.

Intr.: Have you ever been in juvenile hall?

B.I.: Yeah. I was in juvenile hall one time when I ran away from home.

Intr.: Would you tell us about that?

B.I.: Well, there was one buddy of mine whose dad hit him some. So we got together and we took off for Greeley. They picked us up there and brought us back.

Intr.: How old were you then?

B.I.: Oh, I guess about twelve.

Intr.: Did your mom come down and get you out of the hall?

B.I.: Yeah, she came down. My mom and my dad.

Intr.: What were you guys gonna do?

B.I.: Ha! I don't know.

Intr.: M---, you never got into trouble much when you were a youngster. Just a little fighting and that. Uh - why do you think it was that - uh - you didn't get into more trouble - why didn't you end up in jail quite a bit?

B.I.: I think my older brother, one of them anyway, because he went to Bueney (Buena Vista) and when he got out he told me about how they beat him and that and hit 'em with hoses. I just got scared.

Intr.: You didn't get into difficulty because you were actually frightened.

B.I.: Yah.

Intr.: What else did your brother do, that is, he told you all about this but what else did he do?

B.I.: He's passed away now, but I used to bum around with him a lot. He got into car accident and was killed.

Intr.: M - , do you feel you have ever had a really lucky break in life?

B.I.: No.

Intr.: Have you ever had a really bad break in life?

B.I.: Yah, if I wouldda graduated I think I would be able to get a better job and I think if my mother and father wouldn't a had so many kids, I would a had a better chance.

Student: M - , have you ever heard about a way of getting a high school diploma by just taking a test - the G.E.D.?

B.I.: No, I haven't.

Student: Does a man with a family have a better or harder time getting a job?

B.I.: I think a better time. If you tell somebody you have a family you have a better chance to keep your job.

Intr.: M - , here is a general question. Can you think of anybody that you look up to in life as having been successful - having really gotten somewhere?

B.I.: Yah. There's uh S - , he owns a barber shop up on Federal. He went to Buena Vista and he came out and joined a barber college. In fact he's the one that told me all about it and he graduated and now he's got his own barber shop, so he's doin' pretty good.

Intr.: I guess one of the things that you told us is the two people you really respect are your brother who was in Buena Vista and S - this barber. Both of them came out of Buena Vista and made good. In your contact with other kids who have been in reformatories, how are they when they get out?

B.I.: Well, some straighten out and some just go back. I've got a buddy right now he's in the county jail. I guess you probably read about it. They pulled a stick up in the north side and its the first time he's ever done something like that. They killed this cop or someone. He'll probably get life. He's about my age and he's never been in trouble before.

Intr.: Do you have any idea why he did it?

B.I.: Well, he was the clean up guy in the joint and he was working there and I don't know.

Intr.: M - , have you ever heard of the CCC camps?

B.I.: No, I never heard of them.

Student: Have you heard anything about the youth camps they're talking about setting up either on the radio or in the newspapers?

B.I.: No.

Student: M - , since you've been looking for a job, do you feel that you've been turned down at any time because you don't have a high school diploma?

B.I.: No. When you're looking for labor - they're the kind that I'm lookin' for, you don't have to use your head much and I don't think I'm turned down because of that.

Student: M - , have you ever gone to private employment agencies to pay anybody to get you a job?

B.I.: No, I never have.

Intr.: How do you feel about that - would you do it?

B.I.: No I wouldn't.

Intr.: Why not?

B.I.: Well, I can look for my own jobs.

Intr.: You've been real good M - and we sure thank you an awful lot for coming down here and talking with us and explaining some of the problems that you face and helping us to better understand them.

Applause.

## 2. Field Observations

"The point is, as every educator knows, that merely telling people is not effective education."
L.J. Carr

Colorado School participants heard and actively discussed more than twenty-five hours of lecture - morning, noon, afternoon and night -- for each of the three weeks the institute was conducted. They were told a lot. They told the faculty a great deal. They told each other much. In addition, the students watched and took part in more than ten hours of demonstration sessions during each of the first two weeks. Despite the reality injected by the Basic Instructors, the demonstrations as well as the lectures were essentially classroom experiences. Both occurred within the four walls of the 17th Street classroom or the Oxford Hotel.

Five field observations were planned to move the students out of the classroom and into the areas of the community where the theories and ideas they had heard could be tested. Denver students were generally acquainted with the settings chosen for the field experiences and participants from Montana, Wyoming and New Mexico were familiar with the same kinds of locations in their own states. The objective was not to shock the student with a unique environment which he would not be apt to find again. On the contrary, the purpose was to introduce the student to a familiar situation but one in which he would play a new role -- that of a participant observer. The role of student and observer allowed the participants to view a series of events from a different vantage point, thus encouraging new interpretations of familiar events. The move from the classroom had the further advantage of providing a break from the extreme pressures of classroom routine.

### a) Watching the Unemployed

Purpose

To provide Colorado School participants with opportunities to observe and contact the "hard to reach" unemployed.

Ideas to be Tested

Lack of individual motivation is an inadequate explanation for the failure of large numbers of persons to find steady employment. Many chronically unemployed persons are actively and energetically engaged in an unsuccessful search for work. For this group, looking for work is a full time job which often begins before sunrise and ends late at night. The middle class values associated with personal independence and the dignity of work are held in high regard by these persons, but their own aspirations and expectations are tempered by their continuing failure as well as the failure of persons they know.

The hard core unemployed are isolated from each other as well as from middle class society. Their failure in obtaining jobs may be a result of lack of information about where and how to look or about the opportunities which exist

to help them to improve their skills. This group is not presently reached by the information and education programs of the Employment Service nor by any other state or community agency.

Field Experience

The location of the Colorado School classroom brought students into contact with many representatives of the "hard to reach" group. Each morning, the walk to the classroom brought students past the 17th Street Employment Service office. Known locally as the "Slave Market," this office is a center for obtaining casual or day labor. Many of those who are looking for jobs do not enter the office or register, but simply wait on the street for employers to make an offer.

Another location where job seekers gather is along Larimer Street between 17th and 20th Streets. Each morning while the School was in session, one could see as many men leaning on parking meters in this area waiting for a job opportunity as there were at the Slave Market.

Moreover, much active job seeking occurs between 5:30 and 7:30 in the morning. By the time the participants left the Oxford Hotel for the walk to the classroom it was past 8:00 a.m. and the rush was already over.

In order to get a better notion of the job seeker's problems, Colorado School participants met at the Oxford at 5:45 a.m. on Thursday, October 8. None had breakfast because the hotel restaurant doesn't open until 6:30. They then drove to the Denargo Market, Denver's open-air produce center and a recruitment location for farm and casual labor. The market is about five miles northwest of the Oxford and an equal distance from the minority residential section which provides much of the farm labor in the Denver area.

It was cold and still dark when the group arrived at Denargo, but a few men, mostly older Spanish-Americans and Negroes, had already gathered. The market consists of several rows of sheds and a row of cinder block buildings. Farmers had already arrived and were displaying their produce - cabbage, squash, apples and tomatoes -- beside their trucks. The Employment Service office was in the row of cinder block buildings. It was cold inside the office and only the office manager was there. The laborers stood near the entrance or in front of the adjacent shed where a small fire was burning. Participants spread out and mingled with the waiting men to talk with them.

Normally, the laborers reported, there would be a pretty good sized group present, but the picking season was over and the sugar beet harvest wouldn't begin for another week. Most of the men had not had a steady job, but they lived in Denver and worked whenever they could. They didn't really expect to get a job that morning, but there was always the chance. A few younger men arrived but did not enter the employment office. Several joined the group around the fire and the others stood along the front of the building. After greeting the men they knew, they lighted cigarettes and became silent.

A check with the employment officer indicated that there were few jobs on file for the group standing outside. The board near the door showed that there were jobs available in California, $.80 an hour picking brussel sprouts, rain coat necessary -- but there were no takers.

The work the men obtain at the market is varied but seldom pays much. $1.25 an hour is a good wage, but $.90 an hour is average. When there is no farm work, jobs seldom last more than two or three hours -- unloading a truck, sacking some potatoes or moving bags of cement. If a man makes $5.00 a day he is doing well.

Several employers drove up in pick-up trucks and the laborers moved out to meet them. Three were hired and climbed onto the trucks and left. By 7:30, it was obvious that there weren't going to be any more offers and the men started to drift away individually and in pairs.

One of the students recruited a Basic Instructor from the remaining men, and they all returned to the Oxford for breakfast. On the way to the classroom following breakfast, another Basic Instructor was hired from the group standing in front of the 17th Street Employment Office.

b) Riding in Squad Cars

Purpose

To assist the students to obtain a better understanding of the role of the law enforcement officer toward persons in poverty.

Ideas to be Tested

Participants in the Colorado School heard several apparently conflicting views regarding the problems of law enforcement and the role of the police officer in the poverty sections of the city. Gonzales, Knowlton, and Ramirez had described the humiliation of the minority group member at the hands of the police. The Spanish American or Negro is more apt to be stopped for an identification check when he is walking with friends or driving through certain areas of the city. When he has done nothing wrong, he rightly considers the attention as harassment. There were continual references to browbeating and downright brutality. The Basic Instructors reinforced this viewpoint with examples from their personal experience.

Daniel Hoffman, Denver's Manager of Safety, reported convincingly that the police officers as a group are no more prejudiced than any other group. However, they are extremely sensitive when they work in sections of the city which contribute more than their share of crime and violence to police statistics. The officer responds quickly to cues that he has learned from experience which hint of danger or suggest possible violation of the law. His experience with minority persons in the economically deprived areas of the city is that an I.D. check often leads to the apprehension of a wanted person.

Field Experiences

During evenings of the second week of the school, participants in groups of six joined patrolmen at the Center Denver Police Station for the 6:30 p.m. roll call and briefing. Students were assigned in pairs to a two-policemen squad car team. The shift ended at 3:00 a.m., and most students remained with the officers the entire night. Squad cars were assigned to districts which encompass the business, warehouse, and minority residential sectors of Denver. Between radio calls or during coffee stops, students talked with officers about the problems they had been considering in the classroom. Some teams had a quiet evening with nothing more serious occurring than a traffic ticket for the motorist who made an improper turn. Others saw the violence of domestic quarrels or joined the search for a car involved in an armed robbery. They watched the way in which officers handled the drunks and other unfortunates. They noted that the "view from inside the squad car" is different from that seen by the motorist in his private automobile. Everything that happens on the street is the police officer's business. They reported that the officer's responsibilities are greater and more diverse than they had suspected. One participant met a presidential candidate when the officer with whom he was assigned was called to the Brown Palace Hotel to guard the Senator's suite. He recognized the anxiety that this kind of assignment can create when there are large crowds and an important person to protect.

Two reports from students' logs describe the squad car experience:

We left the station at about 7:15 p.m. in car 12. This district is bounded by 23rd and 27th Streets and runs from Welton to the tracks including the Denargo Market.

The officers are about 35 years of age. H--- has about 12 years experience and N--- 10 or 11. I stayed with them until 3:00 a.m. and the entire shift was a relaxed and friendly affair. They were helpful and cooperative, quite willing to answer any questions. We had several coffee breaks and dinner at about 12:30 a.m. Tacos and hot sauces, etc. Whew! Not over it yet.

Both men kept up a running comment on what to look for in way of behavior, situations, etc., i.e., no reflection from a window indicates a pane missing, etc. I was much impressed by their treatment of the various sick people we picked up as a result of the various calls. Chewing gum to one kid, kindliness in attitude and word to the drunks, delinquents, etc. I don't get the impression that this was put on entirely for my benefit.

Our first call was to cover a fire at a school. False alarm. The purpose of the police is to protect the firemen, who are too busy to do it for themselves. The alarm was apparently turned in by a small group who were disappearing across a distant lot as we pulled up. No chase.

Called to the home of a Spanish American. Drunk and armed with a knife. This was in a development of small apartment houses. This man, 24 years old, was in the kitchen when we arrived, leaning over the sink, sick, crying. His

father was at the kitchen table drunk. Younger brother of about 11 or 12 had just returned from the library and had the books to prove it. A smaller sister was there also. These were nice kids. We removed the drunk who wanted help. He said that he had been drinking since the age of 12. Got mixed up with pimps and bad company. Had been off the stuff for awhile but had gone back. Wasn't working. Said that he never could tell his mother anything. Tried to escape twice. Called the wagon and put him in it. He weighed not much more than 100 lbs. Apparently had not been eating while on the current binge. This man deteriorated to the point of no return. Had tried dope. Named A---. Kept asking who I was.

Next call. Colored woman. Poor, old neighborhood. House very pleasant and nicely and comfortably furnished inside. Husband drunk. Had been brandishing a knife about a foot long. Insisted that he was king in his own house. Had a son in the early 20's who was gentlemanly and quite good looking. They didn't want us to actually take him away. Finally after some discussion, the officers told the "king" to go to bed, which he did. They instructed the woman to call again if he got up and caused any further disturbance.

Next call to pick up a boy named R---. This 11 or 12 year old had run away from Frontier Camp. He had returned home and his mother had called in to have him picked up and placed in Juvenile Hall. The child was eating the remnants of a sandwich with his brother K--- when we arrived. The home was small and dirty. We could look from the kitchen, which was the entrance, into the dark bedroom. The place was a mess.

R--- was crying all the time. He had a close crew cut and he gave as his reason for running away, the fact that the kids in school called him "baldy." The mother was indifferent but the father, a nice looking man, made some attempt to comfort the boy by putting his arms around him as they stood together and patting his head. It wasn't too violent a demonstration.

We took R--- to Juvenile Hall and went through the place. We then took the report to the Juvenile Department at HQ at which time I went through the tank and detention rooms. Shown through by Capt. Shumate.

Stopped a man, I--- S---. He was loitering, standing still and staring at a house as though he were covering for somebody who had broken in or was planning something himself. Took him down to the 5 points station. He had a hinge with him, that is, coiled wire, each projection of which was bent at right angles. This, according to the officers, makes a good skeleton key and can be used for various purposes. It can be classed as a burglar tool. I---says that he was carrying it to suck on, to manipulate it in his mouth. The police didn't take it away from him but recommended that he dispose of it. This he did before leaving the station. He was released. His story wasn't coherent exactly. He said that his car was parked about 5 blocks away because it was low on gas. His home was about the same number of blocks in another direction. The officers drew me a diagram of the area showing his car, his home and where we picked him up. The circumstances were suspicious.

Just before completing the tour we had a call to stop a disturbance at the H--- C--- restaurant which is directly across the street from the 5 points station. Three cars converged and we stepped inside to see what was going on. This is a Chinese restaurant catering exclusively (at least at that time) to negroes. There were some sharp looking guys and gals in there. The trouble maker, a husky, good looking boy and his girl, who was remarkably well built, left and things smoothed out.

I wish to commend the behavior of the officers with whom I patrolled. They were quiet, gentlemanly, friendly and most cooperative at all times. I thoroughly enjoyed their company. Their treatment of the drunks, winos, and addicts was kind but firm. Their questioning of suspects was direct and business like. The pickups were made to answer the questions but only by continuous and repeated questioning and inquiry. One would expect them to be on their good behavior under the circumstances but I have the feeling that they didn't give chewing gum to the kids to impress me. The act was too reflexive to originate at that moment.

This was a revealing and indelible experience.

* * * * * *

We arrived at the police station at 6:30 p.m., many of the officers to go on shift drifted in and about 6:40 p.m. the sergeant in charge assembled the men in three lines. Police cars and policemen were assigned and a car to ride in.

I was assigned District 11, patrol car 11, Officer C--- A---, which covered an area from Curtis Street to the Platt River and 17th to 32nd Street down town, an area around our hotel, and Larimer Street. It was action U.S.A.

The police officer was over 6 feet, about 230 lbs., an experienced policeman of five years service. He had four children and was concerned as to where his home was and where his children went to school. A hood wanted to date his daughter and he politely indicated they had nothing in common.

This police officer was about 38 and he demonstrated efficiency on his job. He took special pains to stop in front of shop keepers' stores and let them know he was around. They seemed to expect this. He chatted and even spoke some foreign languages, kidding with shopkeepers. He had a terrific impact in the neighborhood as he showed and demonstrated respect of other people in the shops and when handling winos he talked their language; they were harrassed some, but seems that this approach tends to curb any additional trouble once they are confronted with breaking a law.

The officer related how his wife got mad at him for going to work one hour early sometimes to study photos of suspects in his district, but he was devoted to and interested in his work.

The rooky cop was much more harrassing in nature and showed that he needed maturity and control to become an efficient officer who could calmly handle routine problems. The experienced officer learned the hard way too, he told me, and showed a broken knuckle and scar he received from smacking wise guys. He seemed to know literally everyone in the neighborhood, their case history, so to speak, and could identify out-of-towners by their smart attitude which he handled with skill in a non-violent way.

### c) Trying Again -- Seeking a Job

Purpose

To provide Colorado School participants an opportunity to experience or re-experience walking the streets in search of a job. To remind students that the job interview with a prospective employee can be uncomfortable -- even frightening -- for the prospective employee.

Ideas to be Tested

When a middle class person goes job hunting, he usually goes to see someone he knows or at least someone he knows something about. He is armed with references from persons who will be known to the potential employer either personally or by reputation. He has a pretty good notion of the kind of job available and he knows how his education and practical experience can best be described to show his competence for the position.

Strip away the references and the job seeker will feel uncomfortable. Add an uneven work history which might include a brush with the law, an unstable family life, a tour in a mental hospital or an education which stopped in the ninth grade, and the person starts to resemble and feel like the majority of the hard core unemployed.

On Monday, October 12, Paul Jacobs described his experiences as a middle class Anglo as he sought to find out how the chronically unemployed live, think and feel. Jacobs had worked as a casual farm laborer in California, lived with a truck miner's family in Appalachia, and was passing through Denver on his way to Mississippi to work as a migrant laborer in the South.

Students commented that Jacobs' presentation had genuine impact because he spoke with feeling about something that he obviously knew a lot about.

On Tuesday morning participants arrived at the classroom promptly at 8:30. They were instructed to prepare a partially fictitious work history which could not be checked by a local phone call. The participant was told that he would be expected to write an essay about the experiences he was to have during the day. The essay should include a chronology of events, a journalistic description of what transpired, and a summary explaining what the experience meant to him. After these instructions were written down, the students were asked to choose the kind of job they would like to look for, leave the classroom, and go find it. Students were to meet for lunch at the Oxford. The faculty would be standing by the telephone to respond immediately if anyone created a problem which he could not handle. Further, the faculty assured the students that it would intercede if anyone got a job and needed help explaining the purpose of the field observation. By 9:00 a.m. the classroom was empty and thirty students were wandering the streets of Denver trying to find a job.

At lunch the group reassembled, exhausted from the anxiety of "walking in the cold" for a job interview with employers who were at best courteous, but not hiring. No two students had employed the same tactics and all agreed that job hunting without the common middle class supports was an interesting, if trying, experience. The jobs sought varied from stock boy and truck driver to salesman in a liquor store and personnel officer of a bank. Only two persons reported that they felt they had actually obtained work and neither required the intervention of the faculty to terminate the field experience.

Although many of the students had been counseling Employment Service clients for many years, they agreed that they had not known how it feels to walk in cold to an employer to find a job. Several commented that they now understood why some of their clients failed to keep appointments and that their counseling would now be more effective in this area.

A number of the student essays provide deep insight into this job hunting field experience:

"I. Chronology. After departing from the classroom I went to E--- (a retail variety discount store). There I applied for a job as an office-sales clerk. Rejected I walked the streets and eventually returned to the hotel.

II. Journalistic Description. Upon entering the store I asked the cashier where I could find the manager. She (the cashier) pointed him out as the man behind the camera counter.

Mr. R---, as I later found his name to be, was busy talking to a man who was, apparently a salesman. I waited some 20 minutes at the nearby watch counter. Mr. R--- eventually excused himself from the salesman and came to me.

He asked me if he could help me. I told him my name and that I had experience as a sales clerk and office worker and was looking for a job in one, or both, of these areas. Mr. R---'s attitude was, as I felt it, one of 'you are interrupting me. I expected you to be a customer.' I felt rejected. He told me he had no jobs open and that he did all his own office work right there where he was talking to the salesman.

I then asked him how much a sales job would pay and he said, in gist, 'There's no use talking about that as I have no opening.' I then inquired as to whether he would accept an application. He said there was no use leaving one as he needed no help.

I then thanked Mr. R--- and left.

III. What These Events Mean to Me. The frustration and feeling of being rejected -- of interfering with a normal course of business -- could, if repeated often enough, result in my not being an enthusiastic job seeker. It could result in eventual withdrawal and terrific anxiety in hunting for a job."

* * * * * *

"The police and firemen civil service office was much smaller than I had anticipated, and therefore put me more at ease than I had been before arriving. The lady who talked to me immediately saw that I might not be tall enough and asked if I were 5'8". As it turned out she was more aware of my size than I was. After she had proved this, she became very apologetic and sympathetic.

My job search then turned toward a position with somewhat less prestige. With some apprehension I entered the still unopened T--- P--- restaurant and asked the bartender, who was stocking the bar, for the Maitre d'hotel. Just then he walked quickly by and picked up the phone. When he had finished he said 'Yes?' to me without raising his head. After I had asked him for work he became more friendly in giving me his negative answer.

Again I decided to lower my sights as to the kind of work and to have something more definite in mind. With the referral I had obtained from the employment service, I approached the I--- M--- Hotel with confidence. After a very short interview I was relieved to leave knowing that there was some chance of obtaining the position.

What the events mean to me. Applying for work is one of the most difficult tasks for me, and, I suspect, many other people. I tried, and fairly well succeeded, to really feel the part of an unemployed job seeker. There was always some degree of apprehension on approaching and then entering an office. Then there was always the discouragement and maybe some humiliation, on leaving without having obtained a position. The lack of knowledge of where to go next was also somewhat unsettling."

* * * * * * * *

"The role I assumed in my attempt to find a permanent full time job in Denver was one of a person with a not too stable employment record, a person with a history of a variety of jobs in several different locations. Truck driving seemed to me to be a logical area on which to concentrate my efforts, since I have a chauffer's license and intended to represent myself as being an experienced route driver in other cities.

My first contact was to the personnel man at a company called P--- D--- which operates a rather large fleet of metro delivery trucks throughout the metropolitan area and also has some larger van and stake trucks to deliver furniture, etc. I was treated curtly by the personnel man, who asked me if I had a chauffer's license, how long I had lived in the city and how well I thought I knew the city streets. I informed him that I had lived here off and on and knew the town fairly well and intended to settle down here. He told me that at the moment things were quiet, but that business picked up strongly around the middle of November. He then offered me an application blank, which he suggested I complete and mail in to him later.

I next called upon the A--- D--- Company's offices where I was met by a receptionist. I asked if I could talk to their personnel man or get an application to fill out for delivery or warehouse work. She phoned the personnel office and asked if they were hiring at present and was told no. She could give me no indication of how I might be able to get on with the company, other than by coming at a time when they were hiring.

Next I checked the want ads of the 'News' for leads and found a laundry down town which was looking for a driver. I hustled over and was directed to the president of the firm. He told me the job had already been filled, but asked me about my experience and then requested me to write down my name and address for him. He said that a lot of people had been in, in response to the ad, and that it appeared to him that there were a lot of people out of work.

This experiment indicated to me that a semi-skilled or unskilled individual isn't considered to be worth much time or the extent of much courtesy in the firms I contacted. Two of these companies weren't hiring anyway, the third had already selected an applicant to fill its vacancy. The man there was obviously tired of seeing applicants. I felt discouraged and pretty hopeless after only an hour and a half of being unemployed."

* * * * * *

"10:30 a.m. Walked from Oxford Hotel up 17th Street to G--- B--- Building to contact a private employment agency regarding work. I was attired in slacks, sport shirt and jacket. I planned to seek work as a man's wear buyer, but with the condition that I had recently been released from the VA Center at Sheridan, Wyoming following a mental condition.

10:45 a.m. Arrived at the building and took elevator to the fourth floor. Located agency and entered modern waiting room which was occupied by seven other applicants, some just sitting, and others filling in application blanks. Two interviewers had clients in separate offices off the waiting room. There was no receptionist and obviously the service was on a wait your turn basis.

11:40 a.m. My turn having arrived I was called into the interviewer's sanctum with a brief 'next.'

The Interview. As I nervously lit a cigarette I explained that I had just arrived in Denver and was looking for a job as a buyer for men's furnishings. I could feel the interviewer's mental appraisal of me was not enhanced by my casual dress in seeking this type of work. Therefore I hurriedly explained that I was dressed for comfort and had other clothes for a potential interview.

Upon being asked what experience I had I recited quite an impressive list of actual and ficticious jobs which I could see were scoring in my favor. I deliberately, however, stated that I hadn't worked since July of this year. Upon inquiry I stated that following my wife's divorce in July I had been in the hospital from a nervous breakdown. I was now on my second cigarette -- chain fashion.

What Events Meant to Me. Had the interviewer reached up and pulled down a curtain between us it would not have been more obvious that the interview was finished and so was I. Although I had hoped for some assurance that I was still a human being -- it could have been the same had I had leprosy. My impressive work credentials were valueless. I was categorized as an unsalable piece of merchandise with no value in the market place. Why? -- because I had been in a mental institution. After a few rationalizing remarks about the slow labor market and demand, I was reinforced by the statement that stores would be hiring Christmas help soon. I was not given a registration, nor told to come back.

It was obvious that the emphasis here was on the monetary market value of the applicant. The human value of extending a compassionate, rehabilitating hand was not present."

* * * * * *

"Did you ever follow in the footsteps of someone seeking work? She sat with a frown on her face, got up and walked around, then sat and squirmed while she made some notes. After checking the telephone book, she left the Institute building and walked two blocks to M--- & Co.; entered the building and took the elevator to the third floor employment office; returned to the sidewalk in fifty minutes with an application blank in her hand; walked around the block and into a man's store to look at men's heavy work shoes on a table and took a free sample of a spruce seedling; wandered around and sat on a bench outside the Colorado University Extension Building; entered the building, went into the bookstore and examined books, walked up to the library on the sixth floor and examined the authors' card index; came down by elevator, walked one

block and entered the H--- manufacturing building; talked to the receptionist and came out with an application blank; walked to the hotel and ate a big lunch.

The task of looking for a job seems to have many faces. The decision to look -- the preparation for looking -- the looking itself -- and perhaps the looking at oneself during the process. It has a time, a physical, and an emotional element. The bones, tendons and fiber of one's whole being. Let's ask her what she was feeling:

I am recently widowed and must work in order to eat and live. I have had no work experience except being a housewife and mother. The associations outside my home have been in church and club groups where I have served in offices which required me to work with people and do some clerical work involving the use of numbers. My friends have told me that I might be able to work in a factory and operate a sewing machine. They told me about some of the employers who hire such workers. I would rather work with people and have decided that I may ask about personnel or office work. I did not know how to start nor what to do, but I knew I had to do something. Today I clothed myself and checked the addresses in the phone book. I walked along the street, pushing myself every step of the way. My needs took me to the employment office of the first factory on my list. The girl at the desk asked me that I wanted and I asked her about jobs. She told me the employment officer was not in and asked if I would like to sit and wait. I sat and waited, and waited, and waited. I became more afraid and could feel the hunger, the loneliness, the cold and the emptiness. After about an hour I asked the girl if the personnel officer was in because I thought maybe I had been forgotten. She told me no, but that I could take an application blank and bring it back later. I left the building and wandered aimlessly around the blocks until I saw a man's store. I went in to look, feeling that I wanted my man. I looked at work shoes and some protection seemed closer to me. A free tree seedling which I picked up seemed to give me some courage. I walked around for a long time trying to force myself to see another employer. The university building had a bench where I sat. I decided to see what books they had by Mr. Paul Jacobs. I went in and looked in the bookstore and checked the card index in the library. I finally went to another employer's building and talked to the receptionist. When I asked for work she gave me an application blank which she had put into an envelope and told me to mail it in to them. I asked her if I brought it back could I talk to the employment officer. She told me no, that they were not hiring now nor were they interviewing prospective workers.

I could not go to see anyone else today and I wonder how soon I will be able to make myself try again. What am I going to do?"

* * * * * * * * *

"I applied for work as a liquor sales clerk at a cut-rate liquor store. Finding no success there, I applied for work at another cut-rate liquor store. I left there and came across a moving company and applied for work there. Then

I applied for work at a combination drug store and liquor store. From there I went to the largest liquor store in Denver and met with some degree of success so I ceased looking at this point.

As I approached the first business establishment with which I planned to apply for work, I began to tense and develop some feeling of apprehension about the application I was about to make. I discovered that I had to force myself to proceed quickly into the store and confront the person inside with my need for employment. I felt that I would lose a great deal of confidence if I delayed action and rationalized too much about the possible attitudes I might encounter and the impressions I might project. This anxiety developed with each interview and had to be overcome in each instance.

I varied my approach in each case to try to see if I received different responses or attitudes. A calm and polite request for work resulted in a polite and casually impersonal response. A negative approach, such as 'you don't need any help, do you?', produced a quick 'we don't need anyone,' and implied the end of the interview.

I then asked for and received the name of the largest liquor dealer in the city and proceeded toward that location. On the way toward the large dealer, I came to a moving and storage company which seemed like another good place to apply for work. There I was told that the hiring authority was located about ten miles away, so I gave no further immediate consideration to this company as I was afoot. I continued on to H--- H--- and entered the store.

The store had many customers at the time; there were several clerks behind the counter who were all very busy with customers; there were two or three employees loading cases of beer and whiskey on carts and delivering them to cars at the curb or stacking them in pick up areas; and a couple of men were calling out orders to the help to do this or that. The combined effect of these activities tended to increase my anxiety and I found myself re-evaluating my qualifications and depth of interest for the job.

All of the personnel wore identification tags and I spotted the owner and approached him at a free moment. He was not interested until I mentioned previous experience. He lost interest when I mentioned I was new to the city, but regained it when I revealed knowledge of another prominent liquor dealer from my home city. The combination of experience and a familiar acquaintance gained me assurance of a job as soon as I gained a local address.

I concluded that each individual looking for work may be called upon to use every resource he has even to be considered for employment. Aside from experience and references, he needs a positive attitude, insight into employer's needs, proper dress and appearance, perseverance, and mobility if possible. I believe I gained a greater respect for their situation and awareness of employment problems of greater depth than I had previously conceived them to be."

* * * * * * * *

"I left the classroom about 9:00 a.m. and started walking uptown where the larger department stores are located. About 9:30 a.m. I met two friends; we bought a newspaper and looked through the help wanted ads. I decided to answer an ad for a route salesman at the C--- L--- S--- Company. I also asked for a job at a manufacturing company in the area and started back toward the main downtown area. After two rejections and much thought to why I couldn't get a job today, I decided I'd quit for today and hit it much harder tomorrow.

The first thing that I felt was that I was out of place. Although I was not dressed in rags I was not dressed according to middle class attitudes to go looking for a job. People on the streets kept looking at me. At the linen company a lady in the office told me to wait in the hall, and a man named S--- would call me. S--- came and gave me a quick looking over. I told him I came about the ad in the paper. He asked if I had any experience in linen route sales. I said no, but that I had four years of delivery driving experience. He seemed relieved and said he was not taking any applications today, but if I had some kind of route sales experience he would be glad to talk to me. I left. Two blocks away I went into the B--- manufacturing company and asked for a job. They weren't doing any hiring.

I think this experience gave me some idea and feeling of how a young unskilled man would feel and behave when out looking for a job. He would feel anxious and depressed. It is not hard to understand why he would feel defeated after a rejection or two. While I walked around down town looking into the store windows and telling myself I would hit it harder tomorrow, I can certainly understand why a young fellow might go get a drink and stay away from home."

* * * * * *

"9:30: Preparation for Interview -- proper dress and travel to employer's place of business.

10:00: Presentation of self to first contact with employer.

10:30: Awaiting sales manager.

11:00: Awaiting sales manager.

11:15: Interview with sales manager.

11:30: Interview completed. Return to hotel.

I arrived at the employer's place of business and was met by a very courteous salesman. I asked to see the sales manager. I was advised that the sales manager was tied up in a deal and would see me shortly. I noted a complete change of attitude in the salesman when he determined I was looking for employment rather than being a customer. I also felt this attitude in other salesmen.

Thirty minutes later was still waiting for the sales manager. By this time I was becoming quite nervous. Sweating palms, butterflies, etc. I was still being ignored by the sales staff although I tried to engage them in conversation.

The salesman I first contacted advised me that the sales manager would be with me shortly. I continued to experience great anxiety.

At 11:15 I was ushered into the sales manager's office. I introduced myself as presently employed by the E--- S--- but was considering a move to Denver due to unfortunate circumstances -- recent loss of teen-age son by accident and the great build up of bureaucratic tendencies in our agencies. I explained that I had had earlier experience in auto sales for L--- Motor Company of R---, Wyoming and some part time experience for T--- Company of Cheyenne. The sales manager had knowledge of the T--- who operate T--- Pontiac-Buick and was seemingly impressed with my knowledge of their operation. The sales manager then explained that due to the strike against General Motors they were experiencing a shortage of new automobiles and consequently were not in a position to hire additional sales personnel. He advised me that if I did decide to move to Denver I should contact him again for possible employment.

I was quite impressed by the amount of anxiety I had experienced while waiting for the interview and now understand why a younger and less experienced person can have difficulty in applying for and obtaining employment. I was surprised to find a feeling of jealousy in the employees. The ability to establish rapport very important."

* * * * * *

"Young man. Age 29. High school education. Local work experience. Looking for job. Truck driver. Neat and clean. With references.

Market and Blake Streets were canvassed for truck driving job. Five major employers were contacted in the area.

At the first stop at the I--- Laundry, employers were very indifferent about showing me to the office and Mr. B---, the employment manager, was not in the office when I arrived. An office girl told me he was in the plant area and to go find him there. I asked a plant worker about Mr. B---'s whereabouts and was told if I would wait there he would be by in a few minutes. When he came by, the plant worker told him I wanted to talk to him and Mr. B---, ignoring me, told the plant worker he would be back later. After a few minutes he returned, looked me over, and asked me what I wanted. I told him I was looking for a truck driver's job. He told me that he was all filled up with a stable crew. He explained business was slow due to the elections and said that he did not know of any firm looking for a driver. Then he wished me good luck and goodby.

My next stop was a very short one, at C---, Inc. The receptionist greeted me and asked what I wanted. Learning of my mission, she called the employment manager and asked him if he was taking any applications for help. She did not specify truck driving. She received a negative response and explained that she was sorry that he wasn't interested in talking to me.

Next I went into S--- and S---. Mr. T--- had preceded me and not seeing him, I went in. I was greeted by the counter man in the part's department and asked what I wanted. I told him I was looking for work and wondered if the company was hiring. He said he didn't think so until a few minutes ago, but they're talking to a man now. His tone indicated that he was very disappointed in the company for not being taken into their confidence (he may have been worried about his own job). He went into the office and returned with a person of authority. This man did not introduce himself or tell me what his position was. He asked what type of work I was interested in and took a piece of paper off the counter, asking me to write my name, address, telephone, and my last employer's name on it. Upon doing so, I handed the paper back to him and he told me that if something came up he would certainly give me a call. I thanked him and left.

I noticed K--- B--- had several trucks in front of it with their name on them parked in front of their office. I went in telling Mr. K--- what I wanted; he looked me over; handed me a pen and a piece of paper, saying he would keep my name on file. If an opening would occur he would give me a call. He did not introduce himself nor did he ask my name or anything about me. I thanked him and left.

The T--- G--- Company was my last stop. I went in and waited at the counter. A young man in working clothes asked me what I wanted, so I told him. He told me that I was in the wrong building and gave me directions as to where I would find the man that did the hiring, and the boss's name. He also volunteered some information about the firm. Going across the street, I contacted

the boss and told him the type of work I was looking for. He picked up a scratch pad, asked me to give my name, address, telephone number, and where I had worked. After giving him the information he requested, he asked why I was no longer employed. I told him I was layed off due to a reduction in force. Next he asked if I had worked only for the two companies listed. I told him no and explained I had had a job which did not involve driving a truck. He looked me over quite thoroughly, then asked what about drinking. I told him not much and he said if something came up he would give me a call.

Time and hunger ended my job search.

Most of the job interviews, especially the first with the I--- Laundry, made me feel that I was being talked down to. My experience at S--- and S--- made me wonder why the employee at the counter was not informed about the type of job opening available. This lack of knowledge seemed to make him fearful and he implied by his actions that the management was not interested in the employees in the firm. Although I was neatly dressed for a person seeking work as a truck driver and probably was more verbal than many, this seemed to have less of an impact than I had hoped. Really wanting to prove I could get a job as a truck driver, each 'no' that I received pushed my ego down a notch. The poor manners and indifference with which employers treated me did not help my frame of mind. I feel that many of them felt it was easier to take some information about me and send me on my way than to come out with a flat rejection."

* * * * * *

"9:30 a.m.: Made plans for job search. Wrote brief description of plan in advance. Also listed work experience, personal data to be used, most of which was partly fabricated or exaggerated.

10:00 a.m.: Changed to dress clothes in keeping with the proposed search for a white-collar position, namely sales. (In-store type sales person.)

10:20 a.m.: Visited downtown store.

10:40 a.m.: Visited another downtown store.

11:15 a.m.: Visited still another downtown store.

11:20 - 11:45 a.m.: Filed application and had brief inconclusive interview at above private employment agency.

12:20 p.m.: Returned to hotel and luncheon.

A job search was planned to include a contact only at --- in downtown Denver. Based on real and fabricated evidence of interest and experience in selling an assortment of lines, planned to seek employment in sporting goods, appliances, furniture and other hard lines. However, when I arrived at the personnel office a sign indicated 'no work applications are being taken today.'

After consulting with a convenient sales clerk, I was told to check at the counter anyway inasmuch as the sign was not always 'right.' Upon my return to the personnel office, I pointed out the sign and asked the receptionist if the message was accurate. She then removed the sign, stating that they were in fact taking applications today, but that there were no openings for men.

Following this unfruitful contact, I decided to try for similiar work at the D--- Company. I entered their personnel office and inquired of the woman behind the counter as to job openings. She said, 'Put out your cigarette,' grunted, and handed me, very coldly, a company application and pointed to a wall counter where four other men and women were filling out the same form. I talked briefly with one of them and learned we probably would merely submit the application and not necessarily be interviewed, so I left.

Inasmuch as I didn't wish to be completely foiled in this project, I decided to make one more contact. I decided on a private employment agency, and after checking the office directories in several business buildings, I located what turned out to be the S--- Personnel Agency. I entered, noting the very plush appointments, to be greeted warmly by the receptionist. I asked about openings and was provided with an application and a contract. I spent roughly 20 minutes in compiling the necessary information. It did not appear that I would be interviewed before 12 noon so I tried to get her to commit herself with respect to specific sales openings, which she earlier had said were plentiful. She continued in this view, to keep me interested (I felt) and also related that 'things in general were tight and even the M--- Company might lay off or move soon.' At this point I noted conflicting data which I had mistakenly entered on the application and, not wishing to create a problem, I excused myself and said I would be back after 1:00 p.m. for the interview.

First of all, anything relating to falsification or misrepresentation leaves me ' cold' and I felt mighty nervous and uneasy; therefore, the project did not give me a fair position from which to adequately judge my reactions. I felt I was treated O.K. at P--- if that is the way their personnel people operate. They did inform me that I could come back Thursday or Friday. My experience at D--- seemed to me to be unusual -- I couldn't feature such cold treatment in such a well-established firm; however, maybe this develops as the size of the firm increases. I was highly impressed with the service offered by the private agency. Very cordial, friendly, though business-like, and a certain degree of personal interest. I think they would have gotten their 60% without too much objection had the situation progressed through the actual placement. The entire search brought back a number of personal feelings that I recalled from actual experiences possibly 14 years ago. I felt a certain discouragement, and a feeling that at times I was facing a stone wall. I also felt exhausted after the three contacts, physically because of the considerable area covered, and mentally because of the normal tension one probably develops when out seeking work plus, in this case, additional tension due to my built-in resistance to unorthodox behavior. On the whole, an interesting experience. I think it did succeed in my viewing a situation from a completely different point of view. I would expect also that had I been of a different color my reception would have been even colder and more discouraging."

* * * * * * * *

"The type of work sought was that of stock or warehouse and generally those companies which were in some field of the construction trade.

The first stop was at C--- warehouse. Results: no openings; 2nd stop, S---: no openings but prospective opportunity; 3rd, C---: no openings; 4th, W---: no openings. No interviews. Took application blank to be returned.

The stop at the C--- was very brief and came the closest to being what might be considered rude. They were very busy and the man in charge made it clear that he was rushed and didn't have time talk. He said there were no openings and, in fact, he couldn't keep the people busy whom he presently had.

The stop at S--- was just the opposite. When asked who the personnel manager was, a clerk directed me to a man in a glassed-in office. I entered the office and explained that I was interested in stock and warehouse work; and that I had recently been retired from the air force as a T/Sgt. with 20 years service. My experience in the military was primarily supply and material work.

He said that an opening did not exist at that moment but they were planning on expansion in the very near future and he wanted to talk to me. He invited me to their coffee room for a cup of coffee and I was questioned in a very friendly and informal manner concerning my qualifications, age, background, and family. When we finished, he gave me an application blank to fill out and showed me to a vacant desk to use for this task. I was urged to be certain that I furnished a phone number where I could be reached. As I returned the completed form, he thanked me and expressed the hope that he would see me again. This may have been a pleasant way for him to take a coffee break and dispose of an applicant at the same time but I had the feeling that he was quite sincere.

The stop at C--- was very brief but friendly. He informed me that he had no openings but suggested that I talk to V--- in Cherry Creek Shopping Center. They were looking for warehouse and delivery men. I didn't follow this up since it is on the opposite side of town.

W--- had no openings but would take applications. This contact was all with the receptionist who explained that the manager was out until late afternoon. This was probably a means of getting rid of an applicant; however, she did give me an application blank which I took with me.

No place had a job opening and this was discouraging. The one place left me with a friendly and hopeful feeling which bolstered my outlook. This pointed out how important an interested, helpful, understanding contact can be for some one under stress."

* * * * * * * * *

"Left institute to look for work. B--- Moving and Storage office moved. W---, no luck. A---, no luck.

I intended originally to apply for warehouse position at B---, but building is vacant. Took city map from counter and left.

Next I went to W--- with the intention of applying for a position in the stock room. I asked the girl at the information desk where I should go to apply for a job. She told me she didn't think they were doing any hiring, but that the assistant manager was coming down the aisle and if I would wait just a minute I could speak to him.

She then called to a man who was approaching and told him that I wished to speak to him. I introduced myself and shook his hand. He said, 'How do you do.' But he did not give me his name. I told him I was trying to relocate in Den ver and wanted stockroom work, that I was from Phoenix and had worked in receiving and marking operations for both Sears Roebuck and J. C. Penneys. I was allowed just enough time to say this much then he said that there were no openings at this time, and they generally hired younger people, but thanks for coming in. One, two, three and out!

Next I went to the A--- furniture company where I received much the same treatment. I asked the first salesman I saw where to go to apply for work. He was quite courteous and asked me to wait a moment and he would get the man for me to see. He went to another part of the sales floor where a group of men were standing. One of the men detached himself from the group and came over to me. I introduced myself to him and again I did not get a name in return.

I told essentially the same story here that I did at W---; experience in Sears' warehouse and at the warehouse for Goldwater's Department Store in Phoenix. The gentleman replied that he had no openings and in fact seldom had an opening. They have a very stable work force, but if I care to I could fill out an application blank and leave it with him. I said I needed immediate work, and asked if he had any suggestions. He said he knew of no openings, but as I had worked for Sears, perhaps I should apply there or at Montgomery Ward as they have a big warehouse operation in Denver. I thanked him and left.

One thing that is apparent in the process of job hunting is the ease with which one can become discouraged. Even after only two refusals the feeling of discouragement starts to creep up on you. Several weeks, or even days, of this could really give you a negative point of view."

### d) Their Language -- Semantic Analysis

Purpose.

To provide participants with an opportunity to perceive the different concerns and interest of a middle class hotel society by listening to the content of middle class conversation.

Ideas to be Tested

While there are many similarities between the middle class and the economically deprived, there are also great differences. Each culture is isolated from the other by the interests and concerns of their different life situations. A sensitivity to this fact is an essential first step toward breaking through the communication barrier which blocks the flow of information to lower socio-economic persons. Moreover, communicating the plight of persons in poverty to the middle class, which has the resources to do something about social conditions, is also required. The middle class is not inhumanly indifferent to the problems of the unemployed; it is unaware of the problems.

Field Experience

Two weeks of living and studying in the Larimer Street district gave students a closer acquaintance with the drabness of the poverty area of Denver and a better knowledge of the persons who seek work and try to make a living there. For the final field observation, the faculty planned an experience which would contrast the Larimer Street setting with the surroundings of those who live in the affluent mobile society frequenting the best hotels and cocktail lounges in Denver. Unstructured observations in such rich settings lead to confusion because so much information reaches the observer's senses that he cannot select out meaningful events from the general activity. Participants were instructed to listen to conversations of persons in the middle class settings and to analyze what they heard according to structured content categories.

Categories:

1. Geographic places (i.e., California, The West Coast, Denver, etc.)

2. Non-geographic places (i.e., coffee shop, 5th and Arapahoe, Brown Palace.)

3. Amounts

   a) Time (90 days, 30 minutes, 1936)

   b) Money (i.e., $1000, 30¢, two quarters)

   c) Numbers (6 carloads, two shots)

4. Commodities (wheat, automobiles, one gross of toothbrushes)

5. Things (my Oldsmobile, another glass)

6. Foods (T-Bone steak, martini, butter and rolls)

7. Important statuses (Johnson - president, the governor)

Each student was given an address book and a pencil in which to make notes on the kinds and frequency of words he overheard. They were instructed to station themselves in locations where they would be most likely to be inconspicuous yet able to listen carefully. Near the registration desk, the bell captain's station, the coffee shop, the lounge, the elevator, or restrooms were suggested as possible locations.

The faculty recognized that most of the eavesdropping would overhear brief segments of conversation, but students were asked to try to obtain information on longer conversations, too. When this was possible, the additional classifications required the student to determine whether the conversation was about family and friends (primary group) or about other persons or things (secondary group). Finally, students were asked to classify the conversation based on whether its content was action-oriented (instrumental) or merely emotional (affective).

Students were asked to prepare a brief paper which should include a chronology of events; a description of what they did, saw, and heard; a dictionary of the words used according to the categories given; and an interpretation of what the observation experience meant. Several essays are reproduced here as examples:

"Chronology of Events and Places:
Brown Palace Hotel Lobby
Brown Palace Ships Tavern Lounge
Bar of 400 Club
UPRR Dining Room

The first conversation I heard was among several people preparing to leave from the hotel. One lady mentioned her difficulty in packing her Japanese umbrella so that it wouldn't be damaged. Another stated they had but 45 minutes to get to the airport. A man said he hoped they would have a nice trip back to California. In response, a lady said she had magazines to read. One lady then gave a man a kiss and said 'Good-by, Dear,' They left.

I then took a position next to a group of elderly ladies sitting around a table in the lobby. They were discussing old acquaintances and mentioned one who sang in a choir, another who played the church organ, one who was taking a trip to Chicago in a week, and then shifted the discussion to flowers.

At this time two ladies walked by and one spoke of a man who had given the nicest talk the previous evening. Then a young man and lady came along and he commented on his coat having a loose lining and said she would have to send it out for mending.

I then sauntered toward the Ships Tavern Lounge. As I approached the swinging doors, two young ladies passed me going the opposite direction and I heard one enthusiastically discussing the straight hair style she had noticed on some other lady.

In the lounge I overheard brief bits of conversation which seemed to center around the value of a firm utilizing a professional business manager to prevent some type of advantage being taken by unethical dealers of some sort.

I then went to the bar of the 400 Club and sat between a small older man in a dark suit and a young, attractive, well-dressed blonde. The conversations were between the handsome lady bartender and each customer individually. The man showed a receipt for winnings from the race track amounting to $6400.00! He indicated he would include this to his annual earnings and pay tax at that time in that manner. In response to a question someone posed, the lady bartender stated that the most important things to her were her expensively furnished apartment and lots of good clothes. She felt $300.00 too much to pay for a short jacket of black ermine, but that $150 wasn't bad for a finger-tip-length blackish-brown suede. She proudly declared that she owned 12 leather dresses that were expensive but very durable. The young lady customer ordered a stinger and then talk centered around music which led to a discussion of the Beatles. The bartender didn't like the music but was very impressed with the

knowledge that they had earned 17 million dollars so far. She stated that if they had a good business manager they really had it made. She also noted that young people were outnumbered by older people 'in Jewish lumber jackets' when going to see the young symbols of success.

I departed for the 400 Club, came back to the hotel, then went to the UPRR depot for dinner and listened to an elderly, well-dressed lady explain that for ten years she had been taking an annual five week plus one day vacation. She also mentioned that their firm was the sixth largest in this area.

Dictionary of cultural meanings:

Japanese umbrella - thing
45 minutes - amount of time
airport - mode of transportation
'Good by, Dear' - affection conversation
California - geographic location
magazines - things
church organ - thing
Chicago - geographic location
a talk - affective conversation
coat lining - thing
send out for mending - instrumental conversation
hair style - affective conversation
business manager - instrumental conversation
winnings - thing, affective conversation
race track - non-geographical location
$6400 - amount of money
annual earnings - amount of time, futuristic conversation
income tax - affective conversation
apartment - thing
clothes - things
$300 - amount of money
ermine jacket - thing
$150 - amount of money
suede jacket - thing
leather dresses - things
twelve - amount
stinger - thing
beatles - secondary group conversation
music - affective conversation
$17,000,000 - amount of money
10 years - amount of time
5 weeks and 1 day - amount of time
vacation - thing? Affective conversation
6th largest - affective conversation

Conversations of the middle class people to whom I listened seemed to dwell upon things and conditions of high order values, which of course is logical, but the precise words used and topics chosen indicated an awareness of status governing the conversation. Their interests appeared to encompass the need to be knowledgeable, economically strong, and to be considered respected and perhaps envied. Personal relationships of humanistic nature seem obscured in the hustle and bustle of their daily activities. Fellowship appears to be somewhat limited to those with equal economic status and to those who satisfy their need for acceptance at their perceived or desired social level. The prevailing concern with material possessions, social status, and command of power requires a continual striving for social mobility, for personal recognition through the accumulation of wealth and/or power, and this concern leaves little room for compassion and understanding, with respect to people excluded from their daily functions. I would guess that their awareness or knowledge of the poverty-stricken likely would be as abstract as some of the status conversations in which they participate. Frankly, the conversations I heard revolved in regions far above the world in which I operate; at least some of them and to some extent."

* * * * * *

"At approximately 5:30 p.m., Sunday evening, October 18th, 1964, I entered the Imperial Room of the Cosmopolitan Hotel, located at the intersection of 18th Street and Broadway, in down town Denver, Colorado. A showing of new Oldsmobile automobiles had apparently been held earlier in the day in another section of the hotel. I seated myself at the bar. At a table nearby, three well-dressed, middle-aged businessmen were seated at a table. All wore name tags and each had a drink in an oversized old-fashioned glass. This cocktail room is considered plush, with thick carpeting, heavy paneling, and thickly padded, vinyl covered chairs and elbow rest on the bar. Waiters took their time as the place was not busy.

These men were evidently discussing business, government, schools, and their jobs. The television set at the other end of the room was loud and it was difficult to hear their conversation. The following fragments were overheard: 'Well, thank you, Jim' -- 'He's rather old-fashioned' -- 'This gentleman over here' -- 'I picked up a good deal' -- 'Recently' -- 'I think we would be better off' -- 'He doesn't like it here' -- 'It's their money' -- 'You have to look at it another way' -- 'See for yourself' -- 'Find they're prejudiced' -- 'I think this is such' -- 'I'm willing to larn' -- 'I would say he's pretty well off' -- 'One to a guy' -- '$3.00 for a pair of shoes that will wear out in a year' -- 'Real expendable' -- 'In terms of money' -- 'Future generations' -- -They've all got their problems' -- -The government' -- '$1,000,000 a year' -- '5 or 6'-- 'Nobody else' -- 'It's our business' -- 'Sex' -- 'Youth' -- 'Schools' -- 'This President turned it down' -- 'They are using the Denver Schools' -- 'The schools change' -- '$10 center' -- 'My little granddaughter.'

Dictionary of Cultural Meanings: Geographic Places: None. Non-geographic places: Denver Schools. Amounts: One; 5 or 6. Foods: None. Commodities: A pair of shoes. Things: Their money; our business. Amounts of money: $3.00; $100,000.00. Amounts of time: Recently; a year; future; year. Important Public Statuses: The President. This appeared to be an effective conversation.

Interpretation of what this means to me: It seems obvious to me that this type of conversation would not be heard in a slum area nor would the problems discussed seem to be those common to the lower-class sub-cultures. These men apparently were discussing, in a passing way, a broad range of topics including their businesses, the government, education, citizenship obligations, the cost of living, and personalities. They seemed to have a wealth of knowledge and opinions about a wide range of activities both from first and second hand observations.

At approximately 6:20 p.m., Sunday, October 18th, 1964, I entered the Continental Trailways Bus Depot located on Broadway in downtown Denver, Colorado. I seated myself at a booth and toyed with a cup of coffee while listening to two young men, apparently in their late 20's, in the booth next to me. Both were dressed in sports clothes, not recently pressed, one needed a shave, and both appeared to be travelling. They were eating sandwiches and drinking coffee.

Their conversation went like this: 'I want to go back to the Grand Canyon and Northern Arizona some day. It's so beautiful there. Southern New Mexico is all right. I can't remember the names of the places. I liked Taos but all the Indians want is money. Everytime you take a picture they've got their hand out. I wonder who got them started on that? They've always been that way -- since the first settlers. I travelled by Volkswagen bus with a folding table inside and fixed my own meals. I shot a picture one morning, right after breakfast, of an Indian on a horse. He rode right straight up to me and wanted a dollar. I told him I didn't have a dollar. Then he wanted 75 cents or 50 cents. I didn't pay him. Told him I was broke and he got mad. I'm going to Utah, Southern Arizona, and New Mexico this time. No, I'm not a student. Just travelling around. It gets cold around here -- 25-30 degrees tonight. New Mexico will be just like that now. Where is Mesa Verde? Northeastern or Northwest New Mexico or Colorado. I've never been there. Cliff-dwellings there.'

Cultural meaning words: Geographic Places: Grand Canyon; Northern Arizona; Southern New Mexico; Taos, New Mexico; Utah; Southern Arizona; New Mexico; New Mexico; Mesa Verde; Northeastern New Mexico; Northwest New Mexico; Colorado. Non-geographic places: Cliff dwellings; Amounts: 25-30 degrees. Foods: Meals; breakfast. Commodities: Money. Things: A picture; Volkswagen bus. Amounts of Money: a dollar; 75 cents; 50 cents. Important Public Statuses: None.

Interpretation of what this means to me: This conversation was apparently conducted between two young men who were used to travelling and sightseeing in the Southwest. They spoke in 'worldly' terms of faraway places; those past and those in the future. They did not speak in the manner of the curious or the dreamer -- but simple statements of fact. I would hardly expect to hear this type of conversation on Larimer Street or other slum sections of the country. To people of the poverty-class, the past is best forgotten. Life is but for today. The limits of 'their world' would probably be the limits of their city. The expectation of an Indian on a horse would be a rare pan-handler indeed. I doubt seriously that very many people around Larimer Street have ever taken any pictures."

* * * * * *

"Field Observation: Cosmopolitan Hotel.

Chronology of events: 3:00 p.m. -- departed from Oxford Hotel; 3:25 p.m. -- began field observation at Cosmopolitan Hotel; 3:30 p.m. -- lingered near hotel ballroom where Democratic rally was being held. Much traffic -- brief conversations, mainly welcoming or political types; 3:40 p.m. -- lingered in lobby near room clerk, guest arrivals; 4:25 p.m. -- tried lounge and coffee shop, very little activity; 4:45 p.m. -- lingered near hotel entrance, also near Oldsmobile display; 5:15 p.m. -- concluded observation and returned to Oxford Hotel.

Journalistic Description of Events: Entered Cosmopolitan Hotel at 3:25 p.m. for purposes of observing 'middle'class' activities and to determine topics under discussion while engaged in these activities. Noted the Democratic rally which was getting underway and drawing considerable attention so I took a position near the hotel ballroom entryway and listened in on many short-type conversations, most of which were greetings which generally drifted into political remarks and generalizations as to slates, candidates, attendance, etc. The traffic was heavy and fluid and therefore difficult to pick up more than one or two sentence conversations. Next position taken was near the registration desk where guests were being served. Discussion again were quite general -- about airplane schedules, flights, weather, etc. A 1965 Oldsmobile was on display in the lobby and was drawing considerable attention so my next position was in this general area. Discussions overheard included remarks as to the elegance, beauty, price, etc. of the vehicle. I then moved nearer the hotel entrance to be in a better position to 'drift' along with the new arrivals in order to pick up more of their conversations. Topics discussed included air conditioning, anti-freeze, politics, luggage, air flights, cocktails, elections, etc. Once the rally got underway the traffic slackened so I concluded the observation and returned to the Oxford Hotel.

Dictionary of words used by those under observation: (Short conversations)

Cultural meaning words: Geographic places -- Europe, Salt Lake City, Washington State, East Idaho, Nebraska, Chicago, Aurora, Los Angeles, Texas; Specific places - Brown Palace, Century Room, Trader Vics, Carriage Room, Air Terminal, Imperial Lounge, coffee shop, lobby, phone booth; Time -- 3 hours, 4:00, 3:00, 1923; Money -- $52.00, 12, 18, 7, 600; Numbers -- 33, 79, 2, 300; Commodities -- dresses, automobile (2), anti freeze, books, literature, Oldsmobile (4), Volkswagen, rental car (2); Food & Things -- lecture, air conditioning,

Democrats (6), rally (2), votes (2), ballot box (2), speech, reservations, taxi, cocktails (4), luggage (3), coffee (2), 'drinks' (2), election (2), steaks (2).

(Long conversations) Two elderly ladies discussing lecture held next door at Reserve Bank. Past events -- unable to determine whether primary or secondary. Neither instrumental or affective. Reflecting as to speech and literature.

Two airlines pilots conversing as to recent flights. Primary group -- present and past -- cloud cover and flying conditions between Denver and Salt Lake City, bumpy ride. Affective.

Discussion between party worker and new arrivals -- most greetings were by name -- content had to do with efforts of party worker trying 'to get as many people to vote as I can.' Primary and secondary groups -- past, present and future -- instrumentive.

Discussion between two rally participants. Content 'Have you seen Steve McNichols come in yet?' Also, 'If Johnson wins the election you can bet Steve will be offered a good job.' Present, future, primary, instrumentive.

Discussion between two gents viewing Oldsmobile on display. Price of $5200 was discussed. One likened the simulated top (hardtop) to a 1923 or 1924 'Rickenbacker' he had owned. Secondary group, present, past, probably affective.

Interpretation based on Items I, II, and III: This is an elite hotel and I felt the people whom I observed would fall into the upper-middle class primarily. Type of dress appeared exceptional - above average in my estimation. One lady, very well dressed in what I consider to be a cocktail dress, stated to a friend that she would have to change into something more 'cocktailish.' All appeared well fed; women using expensive perfumes; men with expensive (?) cigars -- a far cry from the class of people we have been learning about over the past two weeks. The thought also came to mind as to whether these people ever had thoughts of the people in the 'Larimer' area; probably they didn't. Noted a number of Negro couples in the lobby, also well dressed, but they tended to sit alone, to group in pairs; no particular patterns in evidence however. Noted less attention was paid to the Oldsmobile by this class of people. Almost a casual glance -- very few looked at the price sheet. Mentally compared these reactions to those of a typical Montana 'shopping center' crowd in the same setting -- probably would be more admiring glances and even closer examination. As well as more wishful thinking. Also noted a distinct difference in the speed of movement of this group as compared with the average or typical lower-class individual. These people seemed to be on-the-move briskly, as though every second were extremely valuable. If a comparison was to be made between this class and the class of people generally seen in the Oxford Hotel area of Denver, the difference would have to be described in terms of 'nite and day'. A very rewarding experience in terms of individual and group differences."

* * * * * * * *

"Chronology of Events: 3:00 p.m.: left Oxford Hotel; 3:10 p.m.: arrived Hilton Hotel; 3:15 p.m.: started inspection of hotel for best vantage points; 3:20 p.m.: visited coffee shop -- 1st conversation; 3:40 p.m.: left coffee shop for main lobby; 3:50 p.m : next conversation overheard; 4:00 p.m.: visited cocktail lounge; 4:10 p.m.: next conversation surreptitiously listened to; 4:30 p.m.: new conversation picked up; 4:50 p.m.: another conversation partly overheard; 5:00 p.m.: left Hilton Hotel and toured area between Champa and Larimer Streets including 20th Street Recreation Center; 5:30 p.m.: arrived back at Oxford Hotel.

Upon arrival at the Denver Hilton Hotel I thought to myself 'if this is middle class living, I'd like to join.' It appeared to me that I had stepped from the average American way of life into something pretty high on the ladder of life. The physical surroundings, atmosphere and attitudes were almost overwhelming to me. There appeared to be no hustle and bustle as generally associated with middle class hotels, but more of a calm, relaxed, almost boring situation. In order to get oriented I sought out the 'great equalizer,' a cup of coffee. In the coffee shop I overheard my first conversation between two gentlemen apparently discussing something to do with one of their business operations. Their conversation was quiet and calm but I did pick up snatches describing a process that if one business man could have a particular product by 9:00 a.m. he could return it completed by 2:00 p.m. I then ventured into the main lobby, which was almost deserted, where I spotted two middle aged men engaged in conversation and I managed to get close enough to overhear talk of boating, yacht, racing, psychology, too late in life, early twenties, 18 year old child, a house bought in 1958 and sold twice. The figures $30,000 and $35,000 as selling price involved. The city of Kansas City was mentioned as was pediatrics. I gathered from snatches of other conversations that some type of medical convention must be in progress as I overheard the mention of hospital administrator on two occasions. While sipping a vodka martini in the lounge I heard a cocktail waitress exclaim loudly that there are more drunks in Denver than in Las Vegas. Very shortly a man and an apparent lady moved to the adjoining table and ordered Old Fashions. It was my belief that they too were associated with the medical convention as I overheard mention of hospital administrator as key man, nurse-physician relationship, physician as top man and focal point and how the nurse complements the physician. The conversation then drifted to an opera house, metropolitan opera, and how the food was terrible at this particular place and a mention of brunch. The Mustang automobile was included in their talk. The conversation then varied further and I picked up snatches about lemon and maple syrup and whiskey sour. The conversation then apparently returned to medicine because I heard mention of 'off-campus' and three grants and only one laboratory.

Upon leaving the Hilton Hotel I returned via the Larimer Street area and located the 20th Street Recreation Center so often mentioned in class. I arrived back at the Oxford Hotel much relieved that the ordeal was over.

Dictionary of Cultural Meanings: Geographic locations -- Denver, Las Vegas, Kansas City; Non-geographical locations - -- opera house, laboratory; Amounts (money or time) -- $30,000, $35,000, 18 year old, 1958, 3 grants, 1 laboratory, 9:00 a.m., 2:00 p.m.; Commodities -- whiskey; Foods -- lemon, maple syrup, brunch; Things -- yacht, pediatrics, psychology, hospital administrator, key man, top man, focal point, drunks, grants, nurse-physician relationship, boating, racing, Mustang automobile.

This experience proved to me the sharp distinction between the so-called 'lower class' type of existence I have been surrounding myself with for the past two weeks and the 'middle class' living. These differences were obvious in conversations, dress, attitudes and outlook on life itself."

e) In the Home

A fifth field observation experience which would have taken Colorado School participants directly into the homes of the economically deprived in the company of a social case worker had to be cancelled. Arrangements were originally made with the Denver County Welfare Department to visit the homes of Welfare recipients, ADC families, OAA and medically indigent persons. The field trip had been planned for Friday, October 16, immediately following the lectures by social worker Mary Sneed and psychologist Dorothy Sherman. Both faculty members had described the problems and influence of the home environment on the school drop out and delinquent youth.

Paperwork created by a Washington, D. C. policy decision regarding matching funds for ADC support removed the social case workers from the field and it was not possible to reschedule the visits for Colorado School participants. The participants were urged to arrange a similar field observation for themselves upon their return to their home communities.

3. Evening Sessions

Twelve evening sessions were scheduled for Colorado School participants. The purpose of these sessions was to provide opportunities for participants to become better acquainted with each other and to exchange views on some of the more controversial aspects of the economic opportunity program as it was perceived by themselves and persons in their various communities. Since many of the faculty members were from out of state, the evening sessions provided the only opportunity in a busy lecture schedule for informal discussions on the content of the day's presentation. Further evening sessions decreased the disparity between local participants who could go home to their families each evening and the out of state students who could not. Finally the sessions were designed to demonstrate or reinforce the concept that working with the economically disadvantaged and the 'hard to reach' is not an eight to five job. Thus, the entire structure of the Colorado School was conceived to break down the patterns which participants followed when working in their respective employment service offices with the expectation and hope that participants would be more apt to attempt innovative procedures in their own Youth Opportunity Centers, if their preparation consisted of an innovated and unorthodox educational experience.

Public Lectures

Two public lectures were presented for the purpose of informing Denver citizens on the nature of the war on poverty and also to provide a favorable public

view of the Colorado School and its participants. Both lectures were given in the auditorium of the Denver Public Library and were followed by an informal reception at the Oxford Hotel.

On Monday evening, October 5, Peter Henley, Deputy Associate Commissioner, Bureau of Labor Statistics, ably presented a national perspective of poverty, the different bases for defining poverty and the characteristics of the different groups affected.

On the following Monday, Paul Jacobs, Institute of Industrial Relations, University of California, Berkeley, presented a description of poverty as he had experienced it as a journalist who joined the poverty stricken in California and Appalachia.

Public attendance at the lectures was sparse as a consequence of an unscheduled arrival of a presidential candidate and other sorts of pre-election activities. However, the small audience did not detract from the actual presentations. The basic principle of keeping the community informed, of developing programs by inviting their active participation, remains a guideline for the creation and execution of programs which require community support.

## Chapter VII
## Program Analysis

Because it was recognized at the outset that the Colorado School involved several departures from the more orthodox college campus educational style, a studied effort was made to gather information which would help the staff and the sponsors to determine its value. Accepted research procedures would normally call for carefully selected control groups, matched for important characteristics, and studied for differential responses under controlled conditions. As is the case with many educational ventures, it was not possible to obtain measures of this sort. It was, however, possible to obtain the response of participants to the program experience through questionnaires which asked for their subjective evaluation of the experience. It was further possible to posit possible areas in which participant's opinions or attitudes might be expected to change if the program were to be effective in attaining its objectives. Thus while it was not possible to compare participants with others in a program which had similar objectives, we were able to compare the participants with themselves.

In all, six different instruments were developed to assist staff to assess the overall impact of the program.

The first instrument was the Daily Log (see appendix). Participants were required to complete a log each evening which was handed in each morning. The logs were carefully read each day by staff for cues about the way the program was being received and interpreted by the students. In addition, following the school, an analysis of the logs was completed to determine the frequency ratios of different kinds of ideas the students listed as important and the problems which these ideas might be expected to solve if applied on their return home. This summary follows this introduction.

In addition, a series of questionnaire schedules (A, B, C, D, and E) was given on the first, second, and last day of the Colorado School. All of these questionnaires are described and the responses interpreted in the following section.

A few comments about probability statistics and their relation to the size of the sample they describe are necessary to explain why the results reported, although not statistically significant, are interpreted to support assumptions which reflect favorably on the program. Statistical significance is closely related to the size of the population which is studied. In general, a statistic will be significant if it describes a small change in a large population or a large change in a small population. The changes described here refer to changes in the responses of a population of twenty-five persons - a very small population, indeed. In such cases, it is not unusual to use statistical analysis to establish directions of change. Using the statistics as a guide within the context of the entire situation, the program analyst then makes inferences about the results. When this is done, the analyst avoids the use of statements such as - "definitely proves," or "supports," and uses phrases such as - "tends to support or suggests."

1. Analysis of the "Employment Security Institute Log"

The requirement that each participant maintain a daily log of the events and ideas of the Colorado School served a two-fold purpose. The log was structured so as to require at least a minimum of reflection on the day's events and ideas in order to complete the instrument for daily submission. Thus, the log provided a permanent record of each participant's reactions to the school which he could review at some future time. In addition, the log allowed the staff to keep close touch with student perceptions and feelings as the school proceeded. Several changes in emphasis and timing were effected as a result of the feedback which appeared in the logs during the first and second weeks.

Following the institute, a content analysis of ideas and problems recorded in the logs was made. It is not possible to list all of the information, but a summary of major idea categories and problem classifications is presented to show what the participants, on daily reflection, reported as significant.

Inventory of Problems and Ideas from Logs

The table below shows the content and frequency of problems and ideas which were reported in the logs. To assist the reader in interpreting the table, the first tabulation should be read as follows: The problem of understanding the culture of poverty was mentioned 68 times. 68 ideas relating to this problem area were cited by 23 different participants on 14 different days of the school. In citing these problems and ideas, the participants referenced 15 different sources, such as specific lecturers, demonstration field observations, or discussions with fellow participants.

| Reference to Problem Area | Ideas cited to deal with Problem area | Number of Students Reporting | Number of days cited | Number of sources cited |
|---|---|---|---|---|
| Understanding the culture of poverty, the needs of disadvantaged clients and how to effectively communicate with them. (68) | Suggestions noting the importance of the problem area, and various attitudes to remember when working with disadvantaged youth. (68) | 23 | 14 | 15 |
| Lack of Intra-agency cooperation and bureaucratic rigidity. (56) | Ideas based on principles of public administration, the existence of informal structure, development of new reward systems, leadership skills, procedures for conducting meetings, use of consultants, how to redefine situations to allow for innovation and creativity. (56) | 23 | 6 | 7 |
| How to find and contact disadvantaged youth. (40) | Suggestions for use of indigenous leaders, location of offices in poverty areas, use of peer group influence, developing new communications channels, and other field orientated activities. (40) | 16 | 8 | 12 |
| Skills and techniques for working with disadvantaged youth. (36) | Uses of group therapy, sociodrama, role playing, tape recorders for counseling, on the spot interviews in-field, "jobs anonymous" use of field trips to familiarize clients with future jobs and various counseling methods. (36) | 24 | 8 | 8 |

| Reference to Problem Area | Ideas cited to deal with Problem area | Number of Students Reporting | Number of days cited | Number of Sources cited |
|---|---|---|---|---|
| Lack of Inter-agency communication and cooperation (30) | References to the various agencies whose cooperation is essential to deal with multi-problem youth, notes about resources available in different agencies and how to use them. (30) | 17 | 9 | 11 |
| Community Resistance to change. (16) | Ideas about the need for involving the community in planning and development of programs, use of church groups, public relations, advertising failures as well as successes. (16) | 13 | 9 | 12 |
| Finding jobs for clients (15) | The duty of the counselor to help employers develop greater sense of social responsibility, areas in which opportunity structure must be changed, need for training in service jobs areas. (15) | 11 | 6 | 4 |
| Need for new criteria to assess productivity of Employment Service (15) | Ideas about the importance of developing new ways of measuring performance, the use of the university to develop new measures, new and better record keeping, need for better communication with supervisors to reassure superiors that personnel are working. (15) | 12 | 4 | 4 |

## 2. Schedule A

The questionnaire which staff designated as Schedule A was based on a scale originally developed by F. P. Kilpatrick and Hadley Cantril, known as a "self anchoring scale. *

The instrument consists of two related parts. In the first section, the respondent is asked to describe briefly the best life he can imagine and the worst life he can imagine.

In the second section the respondent is presented a series of ladder type scales with ten steps on which the top step (number 10) represents the best life and the bottom step (number 1) represents the worst life. The participant is asked to consider several different social groups (the categories included the participants, average Anglo, unemployed Anglo, average Negro, unemployed Negro, average Spanish American and unemployed Spanish-American), and circle the number on the scale, which in his opinion, represents the life situation of the specific group at the present time.

The purpose of the open-ended questions in Section I of the instrument is to provide the respondent with a personal referent or base line to have in mind as he judges the life situation of the different social groups in Section II, thereby avoiding confusion or meaningless random responses.

The instrument was given on the first and last days of the Colorado School, and the before and after responses were compared to determine if any changes in descriptions of the best and worst life or in the rating of life situations of various groups could be detected.

The questionnaire and several examples of the before and after responses to Section I which are typical and selected at random appear on the following pages.

* "Self Anchoring Scaling: A Measure of Individual's Unique Reality World," Journal of Individual Psychology Volume 16, 1960

Schedule A

University of Colorado
Employment Security Institute
October 5 - 23, 1964

Name _____

1. Everybody wants certain things in life. Think about what really matters to you, then describe below the best life you can imagine, assuming you could have everything just as you want it.

2. Now think of the kind of life you would not want. Describe the worst life you can imagine.

3. Pictured below is a series of "ladders", each with 10 steps. Step 10 represents "the best life" and Step 1 represents "the worst life." For each of the following, circle the number of the step you judge to reflect the present situation.

a. Where I stand at the present time.
b. Where the average Anglo living in_____ stands.
c. Where the chronically unemployed Anglo in_____stands.
d. Where the average Negro living in_____stands.
e. Where the chronically unemployed Negro in_____stands.
f. Where the average Spanish-surname person living in_____ stands.
g. Where the chronically unemployed Spanish-surname person in _____ stands.

| | | A | B | C | D | E | F | G |
|---|---|---|---|---|---|---|---|---|
| | | I stand | Aver. Anglo | Unempl. Anglo | Aver. Negro | Unempl. Negro | Aver. Spanish | Unempl. Spanish |
| Best life | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 |
| | 9 | 9 | 9 | 9 | 9 | 9 | 9 | 9 |
| | 8 | 8 | 8 | 8 | 8 | 8 | 8 | 8 |
| | 7 | 7 | 7 | 7 | 7 | 7 | 7 | 7 |
| | 6 | 6 | 6 | 6 | 6 | 6 | 6 | 6 |
| | 5 | 5 | 5 | 5 | 5 | 5 | 5 | 5 |
| | 4 | 4 | 4 | 4 | 4 | 4 | 4 | 4 |
| | 3 | 3 | 3 | 3 | 3 | 3 | 3 | 3 |
| | 2 | 2 | 2 | 2 | 2 | 2 | 2 | 2 |
| Worst life | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |

The Best Life - Worst Life, Before and After Responses

Example 1:

Best Life - Before

The best life situation, to me would be a life of happiness and economic security and the feeling that I had contributed something to the betterment of mankind.

Worst Life - Before

The worst form of life would be complete lack of freedom, security and happiness and that I had not contributed to the improvement of mankind -- even that I might have contributed to the degradation of mankind.

Best Life - After

Security, happiness and a sense that I have contributed in a positive way to the betterment of the world in which we live. I might qualify the term security by saying that I am willing to experiment and take chances when I think it necessary to work toward the goal of a better world.

The best life is understanding, not only of those immediately around me, but people throughout the community and on to the people of the world. We may not reach perfection such as the complete eradication of poverty, bias, and misunderstanding, but we sure can strive to reach these goals.

Worst Life - After

A world of loneliness, a feeling of not being wanted, is probably the worst kind of life that one can imagine. I cannot conceive of a person being happy when he is left out of human participation, no matter at what level of society he may be involved. Material things play an important part, but consciously or sub-consciously, a man who is not contributing to the development or enrichment of his fellow man probably is at the lowest level of happiness.

Example 2:

Best Life - Before

Family ... home ... essentials, including steady work, reasonable income with which to adequately care for those close to me. The latter would serve to provide the important necessities such as clothing, food, and proper and adequate care for personal well-being.

An environment which would permit constant improvement and pleasing change.

Worst Life - Before

... A life without any opportunity to advance based on personal initiative and exercise of talents ... a life drab, cheerless and friendless ... a life without plan or purpose.

Best Life - After

A family of my own, well housed and otherwise provided for. All of us good members in our community; actively participating to the limit of our skills and interests in its overall improvement. I want to feel and know that we belong. I want always to learn new things and grow intellectually.

Worst Life - After

A life alone without that feeling of belonging that is so important to me.

A life without people I know and trust.

A life without books and bright hopes for my future tomorrows.

Example 3:

Best Life - Before

A constructive type work with adequate pay and time to enjoy the work and the time off with my family. Also home and work I can be proud of.

Worst Life - Before

Lack of the necessities of life and lack of loved ones.

Best Life - After

Love, respect, acceptance by my peers, security, and an opportunity for accomplishment.

The best life is one that includes friends, a close knit family and a job that gives a feeling of accomplishment, respect and provides a comfortable living for the family. One that provides freedom to work and freedom to relax.

Worst Life - After

Lack of friends, not wanted, cold, hungry and jobless and no hope of improvement.

The worst life would be one where hope had gone and possibly a member of a minority group who had no acceptance. Lack of friends and family, and destitute living conditions. This could be a member of the itinerant labor group.

Example 4:

Best Life - Before

I want to be able to provide more than just the bare necessities of life for my family - more than just adequate food and housing. I want my children to have good schooling and the opportunity to become self-actualizing persons (the opportunity to use all of one's abilities.) I want to have the leisure time to be able to work with and help my children develop into healthy (physically and mentally) mature individuals.

In my work, I want to be able to feel that I am doing something for others. I want to be able to help others to become self-actualizing individuals and to help them receive the opportunities to develop and use their full abilities to meet their needs.

Worst Life - Before

I would not want a life where I did not have the opportunity to provide my family with good housing, food and education. I would not want a life where I had to accept just any job with wages too low in order to satisfy my needs. Even worse than this would be a situation in which because of the environment, I did not acquire the values to want to take advantage of whatever opportunities exist, (although I recognize that without these values I would not realize how bad things were). The worst situation would be one in which an individual can see what others have (the average Anglo) and know that this life is denied him because of color or socio-economic background.

Best Life - After

I want to be able to provide a good home for my family. This means good housing, clothing, education and love. I feel that I have the opportunity to do this. In my work, I want to feel that I have helped provide or opened the way to opportunities for others. I want to be able to express my respect and love for others by opening opportunities to them.

Worst Life - After

I feel the worst life I could possibly have would be one in which I would not be able to provide good home, education, health, etc., for my family because of having a limited opportunity structure. To have wants and desires and not be able to attain them because the opportunity for education and employment was out of reach and closed to me would be the worst life I can imagine.

Example 5:

Best Life - Before

One of the most important things or situations we are faced with is the problem of obtaining a well rounded education that can be used in a practical way and to complete this education first with a degree and then find the ways to continue this education. Cost and family make it harder to do, but the task must be done soon.

I have a fine family, four children, and want them to enter college and develop their personalities and interests. We are continuing to raise our standard of living and feel we shall obtain many objectives with patience and time.

Worst Life - Before

The people who are deprived of an education and who have poor jobs live in depressed neighborhoods along with the environment which lacks cultural associations, are indeed in the most unfortunate situation with little hope for the future.

Best Life - After

My family means a great deal to me; I want to provide the role of father so that my children can look up to me with respect and dignity. Education is a high priority in our home, and as we are continually challenged to make changes in our lives we feel the needs and benefits of a practical education. This also requires a credit on paper, but that credit gives us a chance to really practice what we learn. I love to do counseling with people and feel that they come out of the process with new ideas and ways to help themselves. The gratification is more than rewarding, as they also help me to grow more mature and able to handle more responsibility.

Worst Life - After

I wouldn't want to live like the people who are trapped in the lower socio-economic culture (middle class term) because they live for the day, and I want to plan ahead and see improvement over the years in knowledge and wisdom and would not want a life without hope. These people, because of poverty, are deprived of privileges afforded middle class people; education, proper food or diet, shelter, decent self respect, and proper medical care because they can't afford to pay the cost and are rejected by the middle class because they are unable to compete.

A careful reading of the responses of all participants suggests that they did not significantly change their view of "Best Life" during the three week duration of the school. By and large, "Best Life" is the life that they themselves are living or aspire to obtain and the learning experience had little if any influence on their descriptions.

The descriptions of "Worst Life" appear to change through the addition of two concepts which appear more frequently in the responses on the after questionnaire.

One concept appears to be expressed by such words as "isolation," "detachment," "outsider," or "loneliness." These words as used by participants refer to barriers which the economically deprived person is apt to face because of his lack of communication with the dominant middle class culture or with his fellows who have similar characteristics. For persons who considered family life to have high value in their description of "Best Life," the deterioration of family ties and the resulting detachment which occurs within the lower class group was added to the description of the worst life.

The second concept, related to the first, is expressed by the words "hopeless," "futile" or "lack of opportunity." These words refer to the present lack of remedies for the conditions described by the previously mentioned concept. In particular, the participants appear to have in mind the inadequate opportunity structure which confronts many persons who are economically deprived. To have a life in which one accurately perceives that he has little control over his environment or the events which occur in it is a further addition to the conception of "Worst Life." Several participants mention the source of these ideas as Paul Jacobs' lecture on the itinerant farm laborer or "Harvest of Shame," a film which described the plight of the migrant farm laborer.

In summary, participants describe the "Best Life" as the life which they are living or the life which they perceive they will achieve by applying themselves. On the other hand, following the three week experience, they appear to have recognized that the economically deprived person may be strongly motivated, apply himself energetically, and still fail to achieve a better life. Instead, he may remain in the same isolation, sans meaningful human ties with family or friends, despite his efforts. The characteristic description of "Worst Life" is expanded to include these two concepts.

Interpretation of Section II, Schedule A

Participants were asked to rate the positions of several social groups including themselves in relation to the life situations they described in Part I. Program planners had assumed that participants would recognize that each of the groups rated would be significantly lower on the life situation scale than the participants themselves. Further, it was assumed that participants would view the relative life situations of minority groups, both employed and unemployed, as less favorable than their own. Planners did not have detailed information about the participants prior to their arrival in Denver, but since the purpose of the program was to give participants a deeper understanding of persons who exist in the culture of poverty, it was hoped that irrespective of their pre-existing knowledge the program could give them useful information on the subject. Additional information should lead participants to perceive a greater disparity between their life situation and the life situation of the other groups. Thus, if participants did obtain additional information about poverty, and particularly poverty in minority groups, the scale distance between themselves and these groups would be expected to increase when their before and after responses were compared.

Participant ratings were punched on IBM Cards and fed into a computer with a program which calculated mean ( x ) Scores for each category on the before and after questionnaires. The program also computed the statistical significance of differences between categories and the significance of changes between the before and after responses.

Participant Mean Ratings of Relative Life Situations (N = 25)

| | Category | x Before | x After | Change* |
|---|---|---|---|---|
| 1 | I Stand | 7.48 | 7.48 | 0 |
| 2 | Average Anglo | 6.36 | 6.96 | + |
| 3 | Unemployed Anglo | 3.96 | 4.36 | + |
| 4 | Average Negro | 4.32 | 4.20 | - |
| 5 | Unemployed Negro | 2.48 | 2.28 | - |
| 6 | Average Spanish | 4.84 | 4.60 | - |
| 7 | Unemployed Spanish | 2.88 | 2.48 | - |

* a plus indicates that the direction of change is toward a higher estimate of the life situation in the category.

As can be seen in Table (1) Participants rated their own life situation as highest and the life situation of the Unemployed Negro lowest on both the before and after questionnaires. It may also be seen that the estimate of the life situation of the Average Anglo and the Unemployed Anglo rise in the after column while the estimates of the life situation of the other four categories decrease slightly.

None of the differences between the before and after mean ( x ) responses shown in Table (1) are statistically significant. However, the direction of change is systematic and is interpreted to support the assumption that participants obtained information during the three weeks which caused them to assess the life situation of minority groups as lower than they did prior to the learning experience. This is further interpreted, in light of other responses, to suggest that participants developed a more accurate perception of conditions among minority groups.

However, it should be noted that participants demonstrated considerable awareness of the differences among the various groups they were asked to rate on the before questionnaire.

Tables (2) and (3) compare the differences between the various social categories participants were asked to rate. Since these tables are slightly confusing at first glance, a brief explanation may be useful. The tables should be read down the column rather across the rows. Reading down the first column of Table (2) it can be seen that the participants as a group (I Stand) rate their life situation as higher than that of all other groups considered.

Reading down the same column in Table (3) it can be seen that after the three week's program, participants rated the other groups in such a way that the mean score for the category "Average Anglo" is not significantly different from the mean score they assigned to themselves. They rate themselves and Average Anglo as significantly higher than the remaining five categories.

Looking down the Unemployed Anglo column of Table (2) it can be seen that the rating of this category shows that participants consider this situation to be about the same as that of the Average Negro and slightly lower than that of the Average Spanish-American. However, after the three week's experience Table (3), participants rate the life situation of both the average Negro and the average Spanish-American as about that of the unemployed Anglo.

In summary, it appears that participants viewed the life situation of both minority groups as similar and the ratings of both decreased on the after questionnaire, but not to a statistically significant degree. On the other hand, their judgment of the position of the Average Anglo and the unemployed Anglo rose during the same period. While this information is insufficient to draw any conclusions about the overall effect of the three week learning experience, it does tend to support the assumptions of the planners that participants would have fairly well-defined notions about persons who live in poverty. It appears that these notions can be changed, and to some extent were changed during the three week duration of the school. It would be interesting to find out if the various other groups have the same perception of life situations as the participants. This question may be subject to study in a future program.

Before

## 3. SCHEDULES B AND D

On the first day of the institute participants were asked to complete an essay instrument which asked four separate questions. The questions were designed to elicit freely given opinion on 1. the nature of poverty; 2. its causes; 3. possible solutions; and 4. obstacles to these solutions in the home communities of the participants. Participants completed these essays on Monday morning, Oct. 5. The responses were then immediately analyzed for their thematic content. Themes were formulated as they appeared in the essays and a tabulation of each recurrence of a theme was maintained as a set of essays was read.

Some of the typical themes were:

1. Describe poverty in your community as best you can both quantitatively and qualitatively.

   A. Poverty is mostly a minority group problem (Spanish -- Negro -- Indian) (14)

   B. There is very little poverty in our community. (10)

   C. Poverty exists mainly in lower socio-economic neighborhoods where the majority of residents are welfare recipients. (8)

2. Explain why this poverty exists in your opinion.

   A. Poverty exists mainly as a consequence of a lack of individaul motivation and self respect. (10)

   B. Poverty is due to a lack of education and skills. (10)

   C. Poverty is due to a lack of job opportunities. (7)

   D. Poverty is due to discrimination in job opportunities. (7)

   E. Poverty is due to a lack of exposure to other socio-economic levels and styles of life. (6)

3. Present your solution to the problem of poverty in your community.

   A. Prepare better educational programs, both general education and vocational. (20)

   B. Install motivation. (6)

   C. Create more jobs -- expand opportunities for work. (7)

   D. Provide more counseling and guidance services to young persons. (5)

4. Describe what you perceive to be the present obstacles to your solution to the problem.

   A. Lack of community efforts, plans and understanding. (8)

   B. Lack of pride and motivation of those who could help. (6)

   C. Lack of money to support programs. (5)

   D. Lack of educational opportunities. (5)

Several essays are reproduced in total to illustrate student responses.

"1. Poverty is not a large community problem in my area -- poverty does not exist and is more of an individual problem. Poverty in my area is primarily among the minority groups -- Negro and Spanish Americans -- we do have some low income groups among the Anglo peoples. Our community consists of nearly 50,000 and of this number roughly 900 are colored and 2,000 are Spanish American with a sprinkling of other races. Poverty in my area consists of low and unstable income -- poor housing -- medium to poor health and lack of security.

2. Poverty exists in most cases due to a lack of individual motivation. This lack of motivation has caused the individual to suffer in education -- vocational training and self concept. Lack of job opportunity for the unskilled and untrained has a bearing on our poverty stricken in our area. There are instances of discrimination in job opportunities and community acceptance, but I believe these are minor.

3. Instill motivation into the individual, into groups and into the community. Get these people to prepare themselves through education and/or vocational training. Try to get these people to regain their self-respect and confidence and respect and confidence of the community. Try to instill a sense of pride in these people.

4. Lack of pride on the part of the group in question, lack of vocational opportunities, instability of the job market are major obstacles. The second obstacle would be the lack of a well-directed community effort to correct the situation."

"1. I realize we have poverty in Denver, but to talk about the quantity is difficult for me. Denver has several areas best judged as slums. These areas are found in the Negro and Mexican areas of town. Houses do not have any plumbing and some are without central heating. Most are overcrowded. The occupants are either working as unskilled workers or are on welfare.

2. This poverty exists for several reasons. Denver does not have a great deal of industry which can hire unskilled labor and so the wage rate for this type of

work is low. The lack of practical motivation by adults and children in the areas of education, job goals and recreation is far below that of the average Anglo parents. The frequently found attitude of adults that God and the government will provide what they cannot for themselves does not help in the formation of a philosophy of achievement for them or their offspring. The lack of common language is a great handicap among some of the poor. This usually cuts down on vocabulary both oral and written. The inability to read well if at all, stops some of them from filling out job applications and knowing about what help there really is available to them.

3. I feel the poor should be helped in developing a new philosophy which will help them fit into the community. This would include a good education for their young and a breakdown of many habits brought from rural and other parts of the country as well as other countries. Realistic goals for young people can help to develop their maximum potential in each child and provide one solution to the problem.

4. The continued lack of respect for a common language, culture, and ethics will slow down any program. I also feel that large programs for adults will not be a great success as would similar programs for young people. Most of the new progressive nations of the world are working mostly with young people and leaving the old alone."

"To a large extent the greatest contributing factor to the unemployment and poverty in Albuquerque is a lack of stable industry. The building and construction industry for example is not stable. Then there is the lack of large industry. Albuquerque over the years has attracted people because of its ideal year around climate, but has failed to attract industry. In the recent past, it is true that some out-of-state industry has come into the area, but the majority of it depends for its continuance upon federal appropriations and government contracts.

Experience requirements are high and hiring requirements are thus restricted. The average man or woman with little or no experience has a slight chance of competing with the highly trained individual.

Except for a couple of electronics training schools and business colleges affording clerical courses, Albuquerque has no technical training schools where the high school graduate or drop-out could learn a trade. Frankly, I have very little to offer in the way of a solution to the poverty problem in my community. I can think of various things that could help. Government sponsored training programs is one. More active cooperation between civic organizations and business is another. The public schools, P.T.A., and parents can also help by creating interest in education and cooperating with each other. A concerned effort by local industry, shopkeepers, schools, and the public at large, could very possibly help to erase the stigma of unemployment in our growing boys and girls in our community. What can be done about the so-called "wino" and

Schedule D

Name _____

In each of the following questions, read through the whole list of alternatives, then decide which statement is closest to (most representative of) your present opinion. Give that statement a rank of 1, then rank the statement next closest to your own opinion 2, and so on until each statement is ranked from 1--most close to your opinion--through 9. The rank of 9 should correspond to the statement the least close to your own present opinion.

1. In most urban communities in the United States poverty is:
   Rank (from 1 through 9).

_____ a. primarily confined to ethnic minority groups.
_____ b. confined to people who lack an achievement orientation.
_____ c. mainly a matter of definition--hardly any person is really suffering in the U. S.
_____ d. a way of life generally acceptable to those who live it.
_____ e. confined to sub-standard slum districts.
_____ f. more a problem in the East than in the West.
_____ g. confined to people receiving welfare aid.
_____ h. a normal condition which will never be completely eliminated.
_____ i. a problem of individual cases rather than a "community problem."

and the "pachuco" -- the mature man and the young incorrigible in our society, I don't know. There is a social problem in our community."

"1. Montana's main pockets of poverty exist among the minority groups, the predominant group being the Indian population. Having a sparse population and being largely an agricultural state, we do not have large centers of abject poverty. Our two metropolitan cities, Billings and Great Falls, are in the 50 to 75,000 population class which again does not breed social poverty. Using a distribution curve of income, we find that the largest concentration is near the mean with a sharp decline in high incomes and also on the other extreme, of poverty.

2. Poverty as it exists in Montana is due to a lack of industrial expansion in employment opportunities. Our economy is seasonal -- with full employment during the summer months and a sharp curtailment in the winter. With regard to the Indian population the principle detriment is the lack of acceptance which can be attributed to the difference in cultures and motivation between races.

3. Regarding the Indian, my solution would be an educational program to build the tribal pride and the background in culture and to preserve the independent way of life. By promotion of their own arts and crafts, they could attain an independent economic status. Much needs to be done to educate the white race in the Indian heritage and philosophy.

4. Public apathy and lack of understanding are the main obstacles. On the other hand the preconceived "packaged" solution offered without any knowledge of the Indian's way of life or thinking in many instances only serves to present greater problems than they rectify."

The set of themes for each question was reduced to the nine most frequently mentioned ideas. These ideas were used as the basis for formulating the four-structured questions used in Schedule D. On Tuesday morning Schedule D was given to the participants and they were asked to rank the nine ideas in each of the four questions, in accordance with how closely the ideas corresponded with their own opinions. This instrument was given again on the last day of the Colorado School.

2. In most urban communities in the United States, poverty is mainly due to:
Rank (from 1 through 9)

_____ a. lack of individual ambition to succeed.
_____ b. lack of skills and education.
_____ c. lack of job opportunities.
_____ d. discrimination against minority group members.
_____ e. lack of knowledge of other possible styles of life.
_____ f. the economic structure of the community (e.g., lack of industries which employ unskilled labor).
_____ g. long term family disorder and circumstances (e.g., husband has deserted the family).
_____ h. lack of resources in a particular area, such as communication and transportation to hear about or get to a job.
_____ i. poor welfare and employment laws which encourage dependency.

3. In most urban communities in the United States, poverty can best be solved by:
Rank (from 1 through 9)

_____ a. developing better education for deprived children in our school system.
_____ b. providing vocational or specialized training for the unemployed.
_____ c. denying welfare support to able-bodied breadwinners.
_____ d. reducing racial prejudice among employers.
_____ e. expanding the job market through new private industry in the community.
_____ f. re-locating people to areas of high demand for workers.
_____ g. exposing youth to successful models from their own group and area.
_____ h. expanding the job market through government projects.
_____ i. re-organizing government agency structures which should handle the problem.

4. In most urban communities in the United States, the most important obstacle to the solution of the problem of poverty is:
Rank (from 1 through 9)

_____ a. community apathy--e.g., it is not a concern of community leadership.
_____ b. the lack of understanding--most people do not realize the extent or nature of poverty in the community.
_____ c. the lack of money to support projects designed to reduce poverty.
_____ d. the lack of expert knowledge about how to change established patterns of behavior, especially for particular ethnic groups.
_____ e. resistance to change by those satisfied to stay the way they are now.
_____ f. the continual movement of poorly prepared rural people to cities with no job market.
_____ g. the need of welfare agencies to concentrate efforts on old and disabled persons when real change could come from concentration on youth programs.
_____ h. the expectation that people can succeed regardless of their present circumstances.
_____ i. obsolete or backward government agency structures.

Ranking of Opinion Statements Before Colorado School Experience (N = 25)

In most urban communities in the United States poverty is:

| | | $\bar{X}$ Rank |
|---|---|---|
| 1. | Confined to people who lack an achievement orientation. | 2.84 |
| 2. | A normal condition which will never be completely eliminated. | 4.04 |
| 3. | Primarily confined to ethnic minority groups. | 4.24 |
| 4. | Confined to sub-standard slum districts. | 4.28 |
| 5. | More a problem in the East than in the West. | 4.92 |
| 6. | A way of life generally acceptable to those who live it. | 5.20 |
| 7. | A problem of individual cases rather than a community problem. | 5.64 |
| 8. | Confined to people receiving welfare aid. | 5.80 |
| 9. | Mainly a matter of definition -- hardly any person is really suffering in the U. S. | 8.04 |

Comments and Interpretation

The original assumptions which the planners made regarding the way in which participants would rank the opinion statements was that during the three-week period student's opinions would reach greater consensus and would show increased convergence on rank scores. (The statistic which was used to determine the convergence is the "co-efficient of concordance.")

On two of the questions, dealing with solutions to the poverty problem and obstacles to the application of the solutions, the level of agreement appears to have increased. On the other two questions, the causes of poverty and the definition of poverty, there appears to have been no significant change in the level of agreement.

In addition, some interesting shifts in the location of items can be observed. For example, on the first question dealing with the description of poverty, the statement that poverty is confined to people who lack in achievement orientation ranked first with a mean of 2.84 on the before questionnaire. On the after questionnaire that statement had fallen to the third position with a mean of 3.84. On the second question dealing with the cause of poverty, Item 1, Lack of Skills and Education, which ranked first on the before questionnaire with a mean of 1.44 fell to second position on the after questionnaire with a mean of 2.84. Lack of Job Opportunities rose to first position.

Thus, in addition to an increase in the agreement about the way in which the individual items should be ordered, participants apparently shifted their view about the importance of certain items. This is interpreted as a recognition on the part of the participants that the influence of social organization in the community and among minority group members is more important in understanding poverty than is a comprehension of individual differences.

## 4. Schedule C

Schedule C was designed by the Staff for the explicit purpose of determining whether or not behavioral science content presented during the Colorado School was in fact discovered by the individual student. For this purpose a test was designed which measured his learning at the end of the school against his perceptions at the beginning.

In each behavioral science discipline there are certain fundamental notions which carry such powerful implications that if they are accepted or rejected, a vast constellation of particularistic or specific facts are affected and take on new meanings. One may use as an example of such a basic or primitive notion, the developmental theory of Freud. If one accepts the idea that the human personality is basically and rigidly determined by the time a child is six or seven years old, this acceptance may have a profound effect on one's notions about what can be done with an eighteen year old high school drop out.

In a curriculum as broad as that designed for the Colorado School there were literally thousands of ideas presented. There were probably several hundred underlying notions upon which these ideas are founded. The staff formulated ten simple statements of primitives which were considered exceptionally important among those which were to be presented. The simple statements were then reformulated in such a way that the favorable response would not appear obvious. The Statements were then prepared as a questionnaire for before and after testing of participants.

The results of this testing are presented on the following pages. The first statement is the basic notion or primitive formulated by the planners. The second statement is the reformulated notion. The before and after responses of the students are reported, examples of their open ended responses are shown, and a brief interpretation is given.

Primitive

Given certain conditions, a person's character can change or be changed at any age.

Reformulation

1. A person's character is set in his early years of life and can hardly be changed in later life. For example, "a child who is lazy when he is six years old will be lazy when he is 21 or even 45 or 60." Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 1 | Agree | 0 |
| No Answer | 0 | No Answer | 0 |
| Disagree | 24 | Disagree | 25 |

Typical Responses

<u>Before</u>

"I disagree. A person's character is most strongly influenced by early associations, but as his environment changes he will, to some varying degree, change with it."

<u>After</u>

"I disagree. We have had many examples of persons who have not changed to any appreciable degree. However, a person's character can be influenced and actually changed as a result of changed socio-economic environs. Hope, opportunity, trust, and understanding I believe are some of the basic factors which can induce character change."

<u>Before</u>

"Agree. I feel that early training in the first 10 years of life at home make a great deal of difference in the way a child might act, react or develop in later years."

<u>After</u>

"I disagree at this time because of the possible changes that can come into the person's life. If the person does have a good change of environment, he may change his attitudes and motivations and could become ambitious at a later date in life. However, if he establishes lazy habits in his early years and makes no effort to change these habits, or finds no reason to change his habits, he probably will be lazy in later years."

Interpretation

It is obvious that the participants as a group had accepted the basic notion prior to the school. One person accepted it during the school. The ideas that "the Employment Service Counselor can be an active agent in inducing change in a person's character" and "that environment is influential" appear seldom in the before responses, frequently in the after responses.

Primitive

Our present federal, state and local governmental systems are sufficiently flexible that the economic problems confronting us day by day can be solved within the existing framework.

Reformulation

2. "It will be virtually impossible to substantially reduce poverty in this country without large scale social change. Existing bureaucratic organizations in welfare, employment, and education must be given up in favor of some entirely new structure capable of handling the problem." Do you agree or disagree with the statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 4 | Agree | 5 |
| No Answer | 1 | No Answer | 0 |
| Disagree | 20 | Disagree | 20 |

Typical Responses

Before Response

Disagree. Existing organizations must use more and different approaches along with new programs and agencies. But, present ideas and policies must, in many cases, also be used extensively.

After Response

Disagree. Social changes and idea changes are necessary, but present organizations with program modification can be very helpful in cooperating with new structures to reduce poverty.

Before Response

Disagree. Poverty can be reduced without large social changes through education and economic opportunities using present organization if properly applied and coordinated. Poverty, per se, will never be eliminated entirely as long as we have individual differences.

After Response

Disagree. We can substantially reduce poverty by the use of existing organizations. These, however, must be given latitude to pursue and combat the problem without many of the present bureaucratic roadblocks.

Before Response

I agree wholeheartedly. Social change is something that is brought about by education, understanding, insight, motivation, changing attitudes, training, employment, etc. Our present bureaucratic organizational structure and its systems are not equipped to meet these needs and only sweeping changes will make it so.

After Response

I agree. We are in a population explosion. Every day more and more goods are produced for more and more people by less and less people. Changes in the agencies that administer welfare, education, and employment services will not effect the desired total result. A continual reduction in the hours of work would only lead to eventual total unemployment. What the people of America need is the creation of jobs -- more and more jobs every day. The only way this could be accomplished would be through sweeping large scale social changes.

Comment.

Most of the participants held the basic idea prior to the school. For this group, the idea was reinforced. For those who held a contrary view, their opinion was also reinforced. The school made no effort to present basic political science or economic theories, as this was not its purpose. Considerable information on public administration and personnel relations which impinges on the operation of organizational structures was presented, but the emphasis was placed on more effective operation or modification within the given framework. Those who accepted the basic notion incorporated references to this information in their after responses.

The absence of change probably indicates that this basic notion is actually a part of an individual's personal belief system.

The Colorado School curriculum was not designed to effect change in this particular area at this depth.

Primitive

Primary group relationships (family, close friends) are exceedingly influential in determining an individual's aspirations and ultimate success in finding and keeping a job; such relationships are perhaps more important than other objective conditions in the community.

Reformulation

3. The poverty of most families in an urban environment is due to the employment market, lack of skills, training and formal education rather than to the informal group relationships of the unemployed person (home life, influence of parent and close friends, recreation activities.) Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 8 | Agree | 13 |
| No Answer | 7 | No Answer | 3 |
| Disagree | 10 | Disagree | 9 |

Typical Responses

Before Response

Disagree. I think all factors listed above must be considered in handling cases of poverty.

After Response

Neither agree nor disagree. The informal group relationships are a result of poverty, however, parental influence or the lack of parental influence can be contributing factors. The informal street-corner group can be very closely knit -- to the point that one doesn't want to leave it. The opportunity for work might overcome the influences of the informal group.

Before Response

This is not a yes or no situation. However, I agree generally that much is due to the employment market, etc.

After Response

I disagree partially. Some is due to the market and lack of qualifications but more is due to the pressures of society which work against him, both in getting training and getting a job.

Before Response

I think I agree. Because I don't feel there are enough remunerative jobs even if we are to assume that a person would be willing to work.

After Response

I agree. My exposure to and observation of the unemployed leads me to believe that most people do want to work and actively search for work which

simply is not available.

Comment

The primitive was directed at emphasizing the role of the primary group. The reformulation, in light of presentations in the school, did not represent the intent of the primitive. However, the open-ended responses clearly indicate that participants recognize the influence of the primary group as highly influential. It is not possible to determine whether this was a change or not.

Primitive

Human beings often respond the way they believe they are expected to respond. An employment officer must be careful not to cue responses according to stereotypes he has, but should allow the client to display all his potential before a course of action is considered.

Reformulation

4. "For minority groups such as Negro and Spanish-surname populations, there is only a small range of employment opportunities available, and very little variation in their skills and training. Thus an employment officer should pay most attention to the fact that a particular individual is a minority group member rather than to the details of his training and capabilities." Do you agree or disagree with the statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 1 | Agree | 0 |
| No Answer | 0 | No Answer | 0 |
| Disagree | 24 | Disagree | 25 |

Typical Responses

Before Response

I disagree. Every individual must be considered for employment at the highest level of his capability. To categorize persons into jobs only because of minority group membership is contrary to the basic concepts of religion and can only result in a chaotic society. Peoples would be deprived of reasons and goals for living and nothing can be worse than to live completely without hope for one's future.

After Response

I disagree. I believe it is necessary to expand job horizons for the minority group and to educate and train these people to effectively perform at these

higher levels. As in all groups there will be those who for one reason or another cannot learn the necessary skills above an unskilled level, but this is not due to racial difference. Rather to a difference in opportunity.

Before Response

Yes, for wherever a change is possible for the better of the individual or employer, this should be considered.

After Response

I disagree, as people are individuals and have varied amounts of experience, motivation to improve their status, and if they want to do something about their situation we might try to help. There are presently limited opportunities today, but may not be so tomorrow. We should start to help them improve their condition so as to relieve their poverty.

Before Response

Attention must be focused both on the fact that the individual may belong to a minority group and to the details of his training and capabilities.

After Response

Disagree. Details of training and capabilities should be used as extensively as possible. Minority group status should be handled objectively, however.

Comment

The primitive is subtle and the reformulation does not adequately reflect the basic notion. However, the responses are interesting aside from their bearing on the primitive. Participants respond in a favorable manner, but in so doing, they hint at some of their most basic questions. To what degree should an employment service representative be an agent of social change? How far can he go in championing the interests of minority groups?

Primitive 5

Recent research has re-emphasized the importance of peer group or reference group on its members. The attitudes of a young person cannot be understood simply by understanding his home environment or his individual personality characteristics.

Reformulation

5. "An explanation of the idleness patterns among the youth in a poverty area of a city must take account of peer group behavior as influenced by their sub-cultures; i.e., their norms of behavior. The idleness of youth can not be adequately explained by the home environment, personality factors, or

the job market." Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 15 | Agree | 15 |
| No Answer | 4 | No Answer | 1 |
| Disagree | 6 | Disagree | 9 |

Typical Responses

Before Response

I agree that the home environment, etc., cannot fully explain the idleness of youth because peer group behavior is important. One must be accepted by his peers socially and one must be very highly motivated to deviate greatly from peer group behavior.

After Response

I agree - the influence of peer group behavior is stronger than any other outside pressure; environment contributes to it, personality factors are overcome by it, perceived opportunities in the job market will be greatly influenced by the peer group.

Before Response

Disagree. Home factors are more dominant than those found outside.

After Response

Agree. Dr. Jessor told us that if we are to explain the type of behaviors that we see we must look both at psychological and sociological factors. These include norms, opportunity and perceived opportunity. We cannot chop off any part of the person's life, or any of the factors which affect it.

Before Response

Agree. It seems to me that all possible factors must be considered in attempting to find an explanation and solution for idleness patterns. Peer group behavior will undoubtedly be an important factor along with the other environmental factors mentioned.

After Response

Agree. I feel that an explanation of idleness patterns as well as other value related phenomena must take into consideration all the facets of the environment. Peer group behavior is certainly an important determinant of how you'd act and react, since so much of their activity seems to involve their peer group.

Before Response

Disagree. Lack of skills accounts for some poverty. I don't believe the job market is a big factor.

After Response

Agree. The pressure of peer groups is the dominating factor I think. From ten to sixteen years youths are greatly influenced by the fear of falling from status. The acquisition of an education is not a desired objective in many poverty groups. Neither is getting and keeping a job.

Before Response

Disagree. Home environment in this instance is secondary, lack of work opportunity is primary.

After Response

I disagree -- lack of motivation instilled in the home environment is one explanation of youth idleness -- lack of job opportunity is the major cause.

Before Response

I disagree -- lack of motivation instilled in the home environment is an explanation of youth idleness. Lack of job opportunities also affect idleness.

After Response

I generally agree -- peer group behavior exerts great pressure on the youth and he strives to get their acceptance. The other factor such as home environment, etc., have some lesser influence.

Comments

While the number of disagree responses increases after the three week Colorado School experience, suggesting a mild rejection of the primitive, the open-ended answers suggest the participants do not reject the idea that peer influence is important in explaining youth behavior. The majority of the participants who disagree following the program note that while peer group influence is powerful, the peer group itself is strongly influenced by the opportunity structure in the community. The job market is one element of the opportunity structure. In terms of the analysis of the response to the particular question, it appears that the notion of opportunity structure is a more basic concept in the minds of the participants than is the peer group influence primitive. The inclusion of the term "job market" in the reformulation skewed the response.

Primitive 6

The human being is sufficiently flexible that he can be taught a continuing series of new kinds of jobs as technological change makes his old knowledge and skills obsolete.

Reformulation

6. "To meet the demands of a rapidly changing technology, the average man in the labor market can, and must learn new jobs as old ones are eliminated. A rapid change in work roles presents no particular adjustment problem." Do you agree or disagree with this statement? Explain why.

Typical Responses

Before Response

I disagree. Although there is a need for retraining due to automation and the elimination of jobs, this does present a serious adjustment problem to most individuals.

After Response

I disagree -- there are many adjustments in the life of a person who must make rapid changes in work roles. These are psychological and physiological and demand understanding upon the part of a family, the employer, and the individual worker.

Before Response

Disagree. A rapid change in work roles definitely presents an adjustment problem -- for all people. As an argument, I offer the behavior of this group in session. All of them, apparently intelligent, and all reacting differently, each in his own way, to this new set of tasks. Some willingly attentive; others unwilling, being pushed. Some would have already been fired by an irritated foreman if this were an actual job situation -- for not conforming readily.

After Response

I disagree. It is true that as technology changes the average man in the labor market can and must learn new jobs as old ones are eliminated. However, a rapid change in work role presents a tremendous adjustment problem. This, I believe, has been adequately shown by studies of employees displaced by Armour, when they closed their meat packing plants in various parts of the country. It has also been shown by studies of other shut-down factories, steel mills, process change, and mining activities. I believe "a man is a job" and changing jobs means changing roles, and changing roles long established, is a tremendous adjustment problem.

Comments

In this particular case, the reformulation probably over-states the primitive. Answers indicate that students have a thorough appreciation of the necessity for persons working in large sectors of our economy to continually learn new job skills. Moreover, responses suggest that most participants believe that most persons who require retraining will be able to adapt to the requirements of their new jobs. Participants, however, respond negatively to the notion that changing roles present no particular adjustment problem. Several participants also note that there will be a small hard core group of individuals who will be unable to adjust to the demands of changing technology. This group will create a special social problem for society and at the present time there is no available solution.

Primitive 7.

Environment is more influential in determining human behavior than inherited or innate characteristics.

Reformulation

"The influence of a person's natural drive and ambition is more important in explaining his chronic unemployment than the influence of his immediate social situation (his relationships with his peers and family, his patterns of security and recreation, etc.). A change in social situation cannot be expected to affect one's drive or ambition." Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 0 | Agree | 0 |
| No Answer | 3 | No Answer | 0 |
| Disagree | 22 | Disagree | 25 |

Typical Responses

Before Response

Yes and No. A person's natural drive and ambition and his social situation are both essential to his personal success.

After Response

I disagree. The influence of his immediate social situation can be a factor in explaining his chronic unemployment. A change in his environment will help him to see himself in a different perspective.

Before Response

I disagree. I feel that a person's so-called natural drive and ambition is

actually a result of a social situation. A change in a social situation will help him change his natural drive which in turn will help him change his social situation. This is a cylce where one can take either as a starting point.

After Response

I disagree. I feel that a person's natural drive and ambition is actually created by his immediate social situation. His social situation defines his opportunities structure, the norms of his group, the social control he has. A change in this will also bring about a change in his perceived opportunity structure norms and social controls, and will influence his employment problem, either decrease it or strengthen it.

Before Response

I disagree. I feel that the natural drive is more or less a product of the social situation in which the individual's ambitions were molded. Also, I have seen particular circumstances wherein individual's social situation was significantly modified either through marriage or the gain or loss of finances - which was ultimately reflected in an attitudinal alteration as well.

After Response

I disagree - I can think of a number of examples in my own experience where a change in the social situation was reflected in a corresponding change in individual drive and ambition. As peer groups and other surroundings have been altered so were the individual's perceptions of their own motivational utility.

Before Response

I agree partly and disagree wholeheartedly if this is expected to be the only answer. Again the individual is the answer. With some people, influence of others is insignificant. With others, it is perhaps more important than anything else. I think these things are often largely tied together.

After Response

I disagree. The opportunity structure and one's perceived opportunities, which are a product of the influence of his immediate social situation, really determines a person's so called natural drive and ambition. Hope for reward and accomplishment (and expectation) greatly determine a person's drive and ambition. A change in social situation can and does affect one's drive and ambition. Attitudes are learned.

Before Response

This is debatable -- generally I would disagree -- if one has the motivation

and drive he can overcome the influence of a social situation.

After Response

I disagree -- a change in social situation can increase or stifle a person's drive or ambition. A person's drive or ambition can be increased through additional motivation brought about by changes in social situation.

Before Response

His social situation may be something he has no control over -- what he does about it is largely his own individual responsibility and, help should be made available to him if he desires. A social change might affect his ambition either positively or negatively.

After Response

Disagree. Drive and ambition are based on the opportunity afforded a person. With lack of opportunity the incentive or motivation declines in proportion.

Comments

Although there is a solid consensus among participants, both before and after the Colorado school, that a person's environment is influential in determining his motivation, there is considerable difference in the ways in which participants express this consensus. A careful reading of the before responses suggests that participants may have given what they believed to be a socially acceptable answer. Following the three-week experience participants introduced a number of references which they obtained during the training program to support their answers which consequently become far more convincing.

Primitive 8.

Chronic social problems can seldom be understood or explained by reference to individual differences. In order to understand or solve a chronic social problem, one must look to the social system in which the problem occurs, rather than to the individual who is influenced by that system.

Reformulation

8. "The problem of chronic unemployment and poverty in this country is largely the fault of our culture's way of causing and handling it (i.e., the fault of the "system" as a whole) rather than the fault of individuals. A substantial solution to the problem can be accomplished with appropriate changes in the system." Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 11 | Agree | 24 |
| No answer | 6 | Disagree | 0 |
| Disagree | 8 | Disagree | 1 |

Typical Responses

Before Response

I disagree -- basic solution lies with the individual not with the system. Have we ever had a time in this country when the problem didn't exist?

After Response

I agree. A breakdown of education, job opportunity system, etc., are due to faults in the system. The system must be corrected or modified, rather than the individual.

Before Response

Disagree. This has some bearing, although the individual factor still figures in. Automation in business has no doubt reduced employment opportunities. The solution to the situation has to consider both automation and its influences in effect, cooperation of business and personal motivation. The individual concerned must be motivated to want to try to do better.

After Response

Agree. The system will have to be changed so that people of the higher classes express and exercise more interest in the poverty of others. One cause of poverty is the feeling of those who are down, that no one cares about them, how they live, or what happens to them. With some people in poverty the interest of others in helping them will possibly stimulate them to want to try and help themselves. Thus, I generally agree with the above statement.

Before Response

Disagree. A substantial solution to the problem may be accomplished with appropriate changes in the system. However, the problem of chronic unemployment and poverty in this country is largely the fault of individuals -- however, the answer to the problem does not lie in finding fault. It lies in the solution. The system may be changed and more individuals may come in, according with it. It's still an individual problem, however.

After Response

I agree. Again this goes back to what I've said before in this connection.

Almost everyone wants dignity, respect, love, a sense of well-being, accomplishment, hope, etc., -- in short, they want to work. It is the system that is setting their pattern and limitations and the fault of the system and not their own fault. People are being "pushed out", "aced out," "forced down," into poverty daily by our system of opportunity.

Before Response

I disagree -- to blame the "system" for the poverty would not on the other hand explain the highly successful persons who have arisen from essentially the same environment as many of the unemployed.

After Response

I have a qualified agreement -- I tend to view the system as a collection of individuals, and feel that individual responsibility cannot be blithely shunted off onto the system this easily -- for I feel that individual recognition of the problem will be, in many cases, a meaningful help toward a solution. However, I would agree that a substantial solution could best be effected by systemic changes.

Before Response

This is probably partly true. Welfare is too easy for those who make it a way of life.

After Response

I agree, generally. Much of the chronic unemployment is due to the limited job opportunities and acceptance of the unemployed group. If our culture could remove the barriers of bias and discrimination and furnish the opportunities for these people to improve themselves instead of maintaining them where they are, you could make them employable.

Before Response

I agree. I think our economic systems should be constructively amended to take up slack, to create jobs as needed, through a system of long-range planning at top governmental (state and national) level. Any single man no longer has control over his economic destiny.

After Response

I agree. I feel that many good persons are unable to find work because of the impersonal workings of the system. The average unemployed man has little or no control over his destiny. Constructive changes can only be expected through "planned economy" compatible with our economic way of life.

Comments

The shift from eleven persons who agreed with this primitive before the training program to 24 who accepted it following the program, is the most interesting and perhaps important shift detected by this instrument. The fundamental idea does not deny the importance of individual differences. However, it does hold that there are certain systems in which no individual can survive irrespective of his positive or negative characteristics. The planners consider this primitive as fundamental to the meaningful attack on any social problem. The change to almost total agreement by the participants supports the view that some very significant learning took place during the three-week Colorado school.

Primitive 9.

All human beings need and use role models with whom they can identify. Minority groups in particular need role models of successful persons with whom they can identify if they are to achieve the necessary motivation to raise themselves to higher socio-economic levels.

Reformulation

9. "The fact is that there are in this country highly successful professionals (e.g., doctors, lawyers, professors), politicians, businessmen, government officials and so on who are minority group members. But awareness of these successful role models can provide little or no help in motivating the typical Negro, Spanish or other minority group youngsters to work hard to succeed." Do you agree or disagree with this statement? Explain why.

| Before Response | | After Response | |
|---|---|---|---|
| Agree | 5 | Agree | 5 |
| No answer | 3 | No answer | 0 |
| Disagree | 17 | Disagree | 20 |

Typical Responses

Before Response

I disagree. Any effort to develop initiative is important and this is probably the best way.

After Response

I disagree. Awareness of these models could help to dispel the hopeless feeling that many minority groups have.

Before Response

Disagree. An accomplished fact is that a successful Negro doctor is like

the old saying "a picture's worth a thousand words."

After Response

Disagree. I must qualify the above answer by saying that the successful minority professionals must contribute to their own groups. Those who attain status will be of no help if they "turn their back" on the group they come from.

Before Response

True -- it is true that a young fellow may set up as his ideal someone he knows. This motivation wears out. The way to make it is through personal ambition and perseverance.

After Response

Yes, it is true -- but emulating a role model is not going to help the young disadvantaged youth with no education in living in a malignant environment.

Before Response

Disagree, a good example set and demonstrated by these people is important to lead and train others.

After Response

Disagree. As an example, the newstand has the magazine on the rack of successful persons in these roles and is designed as a model for those who want to improve their status. However, a group leader could become trained in good middle class standard if he was the right kind of person. He could serve as a personal model to those around him wanting to improve their standards.

Before Response

I agree up to a point. Till the individual has known some form of success, he will not be influenced by knowledge of other's cases. But after he has experienced some form of success in his efforts, he will be influenced more and more by the successes of others.

After Response

I agree. In most cases the successful minority group member leaves his former environment and feels no concern for his former peers. His old associates do not share in his new life and are therefore, not influenced enough to change their habits or behavior.

Comments

The numbers describing before and after change do not provide an accurate insight into the learning which occurred. The open-ended responses suggest that participants learned several facts which influenced their answers. There is the clear recognition that many persons leave the lower socio-economic group, particularly those from ethnic backgrounds, and cease to be available as role models for their particular groups. There is general agreement the role models are at least useful and probably essential. Several participants picked up ideas about how to train or make better use of persons to fulfill the need for providing success figures with whom minority group persons or other persons in poverty could identify.

Primitive 10.

It isn't the absence of persons with good ideas which prevents us from dealing effectively with social problems, but bureaucratic systems, which create and foster routinization thereby preventing the application of innovative ideas.

Reformulation

10. "Once a way of handling a problem (such as chronic unemployment in a city) has been established in organizational structures, there is a strong tendency for procedures to become stable and then in time, become sterile and out of touch with the basic problem. Such "organizational inertia" is more often the basis for the lack of needed change than is the absence of creative reformers, who would sweep away the old in exchange for some new plan." Do you agree or disagree with this statement? Explain why.

| Before Responses | | After Responses | |
|---|---|---|---|
| Agree | 17 | Agree | 22 |
| No Answer | 5 | No Answer | 1 |
| Disagree | 3 | Disagree | 2 |

Typical Responses

Before Response

I agree -- as a technological change, procedures within government structures also must keep abreast of needs and changes.

After Response

Agree. Creative people exist but can perform only when given the opportunity and support to operate quite independently from existing sterile organizational structures.

Before Response

Agree. You cannot argue with success so they say, but what works today

may not work in the future. Each new program points to the need for more and greater creativity, but old patterns so often are retained.

After Response

Agree. The fear of rocking the boat and control of the organization begins to make creativity suspect and feared. If the structure becomes inflexible and unchanging -- relying on old ways to solve new problems -- they will become out of touch because the systems cannot understand the nature of the new problems.

Before Response

Agree. Existing organizations have not substantially reduced poverty. Furthermore I don't feel that welfare employment and educational organizations have in the past addressed themselves directly to the problem of poverty or to the task of effectively and substantially reducing it.

After Response

Agree. Tired organizations exist to perpetuate themselves rather than to achieve objectives for which they were originally designed. However, if creative reformers have positions of power and influence within an organization the organizational inertia can be overcome.

Before Response

Disagree. Creative reformers do not usually appear in sufficient numbers nor can their plans usually be worked out. I do agree that organizational structures tend to institutionalize themselves and bog down in keeping statistics rather than helping people. They hope the economic opportunity act in 1964 will release talents and abilities among those who want to help make the United States a better place to live. Let our ideals make changes for once!

After Response

Disagree. Creative reformers are a scarce commodity. Who wants to be different? Who dares to be different? The problem of creating creativity in people is almost impossible. But given a few more like Shriver who appears able to recognize and use creativity, the problems in social and business life could be solved. I believe that creative minds would become apparent if recognized and rewarded.

Comments

Participants demonstrate they have considerable knowledge from experience on the ways in which bureaucracies hinder innovation and stifle initiative. They are in substantial agreement that organizational structure continually presents problems but, following the Colorado school experience, many participants became more optimistic in feeling that some of their good ideas can be applied and make reference to the presentations of both Professor Bernthal and Professor Sanfilippo to support this view.

5. Schedule E

The responses of your senior administrators who joined the group for the final week are included in the Analysis of this Schedule.

1. What do you feel were the main objectives of the Institute?

The thirty participants who completed this questionnaire gave 107 separate answers to this question. The individual responses were analyzed and broken down into four separate categories.

Objective A. To assist participants to develop an understanding of the culture of poverty. (34)

1. "To inform us of the prevalence and nature of poverty."

2. "To indoctrinate administrative personnel in the ways of poverty and the people living within poverty."

3. "I feel the main objectives were to acquaint us with the problem of poverty relative to the use of the country: its extent, causes, and effect on the individual and his peer groups."

4. "To provide the clearest possible conception in the mind of the participant of poverty."

5. "The description of poverty and what it does to people."

Objective B. Develop an understanding of basic principle of administration and how they can be used; to stimulate innovation and creativity in organizational structures. (27)

1. "So far as the last week of the institute is concerned, I felt the goal may have been to make me aware of administrative concepts and how, as an administrator, I might be more efficient in developing an atmosphere of experimentation, freedom within the framework of bureaucracy."

2. "Encourage non-traditional techniques in innovative behavior in our own Youth Opportunity administration."

3. "To stimulate those who will be minding the program on more inventive ways of organizing, motivating, and supervising Youth Center personnel."

4. "To give some ideas as to how creativity and new ideas can be encouraged within a bureaucratic structure."

5. "The institute gave us techniques which we can use in our program and suggested ways in which we can do the administration job."

Objective C. To assist participants to gain an understanding of their own attitude, values, capabilities, and limitations and how they might improve the level of their competence and skills in working with young persons who are now characterized as the "hard to reach." (27)

1. "To so equip us that in working with these people we can try to place ourselves in their position and see conditions as they do, so that we will have a better basic understanding of the poverty class and will be able to figure out how best to combat poverty."

2. "Increase our ability to relate to people."

3. "To offer some suggestions and ideas as to how people with our background can communicate meaningfully and helpfully with people less fortunate."

4. "To give us an insight into the feelings of those so afflicted."

5. "To better understand our own relationships in dealing with disadvantaged youth."

6. "To make us think and feel at a different socio-economic level."

7. "To increase our effectiveness in working with these people and with people of the other classes -- other social agencies, employers."

8. "To provide us with ideas as to where we should further educate ourselves to better understand the problem and to be able to effectively administer Youth Opportunity programs."

Objective D. To assist participants to formulate clearer goals for the development of their Youth Opportunity Center programs. (16)

1. "The main objectives of the institute were to help us obtain ideas on what our goals are, how to achieve them, and to have a better understanding of the problem at hand and the people involved."

2. "To get us to come up with new ideas to work with the problem and make us willing to use them."

3. "To present information which would give us an understanding of how we can approach the problem."

4. "To help show us how to administer the Youth Opportunities program with the realization of what steps will be necessary."

5. "To orient traditionally trained and oriented employment security personnel in the structure and causes of poverty, the sociology of poverty of the lower class and to help us establish ways of solving the problem."

Question 2. Were these objectives achieved or not? Please explain.

| | |
|---|---|
| Yes | 28 |
| No | 1 |
| No Answer | 0 |

"Due to the volume of knowledge presented, the fine quality of all instructors and participants, the creative realistic approach to learning - I think I have gained invaluable knowledge about poverty, developed a better understanding and concern for poverty stricken persons, and have greatly increased my desire to help better their condition."

"Many of the problems presented were very new to me and many of the techniques are still very fuzzy in my mind. At this time my thinking is not well organized, but many interesting ideas are beginning to take shape."

"I feel I have a better understanding of the problem, that it is not a thing to be ignored, and that I will do my best to combat the problem in any way I am able. I did not receive as much information on the administration and legal organization of the Youth Opportunity Center as I would like to have had."

"I feel that I have the beginning of a truer picture of what poverty is and what it means. From informal conversations with others in our group I believe that most of us have expanded our concept of poverty. I feel that we have the beginnings of ideas as to what is necessary to do and to be in combatting poverty in our communities."

"The objectives were achieved, but only to a limited extent. We couldn't begin in the time allowed to absorb the tremendous body of knowledge and the number of techniques that were presented."

"Probably the greatest learning experience in my life. I cannot say that I understand or can implement all that has been presented here, but I feel that my understanding and knowledge of the problems of youth and poverty have increased one hundred fold."

"I believe that all the objectives I have listed were achieved -- at least I have a more comprehensive understanding of the problem and feel that I received much useful material in each area."

"All the things I have mentioned, you achieved from my point of view. I say "well done"."

"Aside from those areas where the results are not immediately identifiable (such as how much novative behavior we can actually effect), I feel that the whole group has acquired an increased awareness of the nature of poverty and our relationship to it."

"I feel that I heard many new ideas, and have thought of some, and that I

am willing to put them to use. I did gain a better understanding of the problem through the basic instructors and have gained some new techniques to use from some of the faculty."

"In the short time allocated for training, I believe that the main objectives of the program were achieved. I believe we all have a better understanding of the problem. If nothing more, we have more ideas and a more definite understanding of what our role will be and what will be required of each one of us."

"I feel that I will have to display more empathy and not just sympathy in my personal contacts with the disadvantaged. Another task will be the contacting and establishing of personal relationships with members within the different agencies and groups who have a role to play in combatting the problem of poverty. I will have to make use of the reading material supplied us and not just put them on the bookshelf for the sake of appearance."

"It is difficult to deal with this question in the space allowed. The speakers were carefully selected -- the sociological implications, patterns, and modes were presented, talks and role playing and basic instructor interviews presented some techniques in reaching across the class barrier and some extremely sharp business and management oriented individuals presented the management structure, its facets and pitfalls, and suggested methods of creative operation in an organization."

"The insights were new or more vividly portrayed to me than ever before. The basic instructors, the field observations, and the location of the classroom, significantly contributed to this."

"In general all was accomplished. I have a different outlook now than I did before the institute."

"It made me realize how many ways I judge lower class groups by my own standards of measure. I feel that I have some idea of what I may expect to encounter in trying to implement the program in my state."

"The faculty was of high caliber. The information was not only included in lectures, but demonstration, techniques of various sorts. Sanfillipo, Bernthal, Rosenberg, Ramos, Hollander, Hawkins, and Bickel, all made excellent contributions. I also appreciated Hunter's and Higman's comments which were interspersed during the last week."

"For the most part, I feel that the objectives of the institute were accomplished. I do not feel that the objectives of the institute were intended to be a panacea for the job which lies ahead for the group in attendance. I feel that it has been a learning process not only for the class, but for the staff of the University of Colorado which I am sure has profited from its experience."

"Yes, relatively. Many eyes were opened with regard to the possibilities for understanding people who behave differently from the ways that we do. (Ramos

helped here). Also, if we can apply the organizational and inter-personal human relations techniques advanced by Sanfillipo, Bernthal, and Rosenberg, we can help foster an environment in which many new and more helpful activities can occur."

Question 3. Do you feel that your own commitment to work in the Youth Opportunity program has increased, decreased, or remained unchanged? Please explain.

| | |
|---|---|
| Increased | 27 |
| Unchanged | 1 |
| Decreased | 0 |
| No Answer | 1 |

"My own commitment has been increased. With a clearer understanding of the why of behavior of those from lower class cultures, I feel more adequate to help in my role as employment counselor."

"Increased, because of the new understanding of the magnitude of the problems facing those in poverty and the realization that eliminating poverty is a problem for all people. We are in an opportune position to get the ball rolling, hopefully, in the right direction."

"Certainly increased. I feel no more dedicated than before, but now, I feel better qualified and therefore more realistically hopeful as to the results that I might achieve."

"My interest has increased in working in the Youth Opportunity program due to the hope of freedom and action which may come as a result of this institute. Working with young people in the past and realizing that more should be done for them but not knowing what or how, was discouraging. Now I feel with hope and pride, I can do the type of work which will do some good."

"I feel my commitment has increased due to my being exposed to the overall problem at the "grass-roots" level. I now know more about the problem and ways to overcome it."

"Increased. The institute has excited me and stimulated me a great deal. I feel that the program is something that really has somewhere to go and that it is important to me to be a part of it. I feel that working with disadvantaged youth is a great challenge, a worthwhile contribution, and therefore a privilege. I feel that being a part of the Youth Opportunity program puts us in an elite section of the employment service."

"Increased. The desire on my part has not really been changed, but it has been reinforced and expanded by the experience of the past three weeks. I will probably be able to do a better job as a result of this experience."

"Increased. I received a little bit of assurance in how to handle the underprivileged. And, I am more than ever aware of what I do not know and what I must learn."

"My own commitment to work in the Youth Opportunity program has increased. Mainly as a consequence of a greater understanding of the problems and a more optimistic outlook for success, and a better view of the challenge which is offered."

"Increased. Previously, I approached it as another bureaucratic political issue. As such, I was still willing to contribute, but from an agency standpoint. The institute developed a recognition of the need and urgency with which poverty must be attacked; in fact, if placed on a priority system, I would rank it as one of top priority."

"I feel my commitment to work in the Youth Opportunity program has increased immensely due to the explanations of the whys and hows of the problem and its possible solutions. With my limited knowledge of the program prior to this institute, I felt rather uncommitted."

"The commitment or desire remains relatively fixed in my mind. I do, however, feel a greater urgency in implementing the program."

"I was sent to the institute because the program in which I had been working for years is to be incorporated into the Youth Opportunity Center. I really had no choice -- I really had no strong feeling that I wanted to work in a Center as such. Now I have suspicions that my feelings will change as the program unfolds."

"I feel an increased commitment, but I am still hanging in the air. I have no real idea whether I will actually be assigned to the Youth Opportunity programs or not. I now feel a need to be assigned to this area -- but may be returned to exactly the same position I had before. This affects my selectivity and objectivity in the classroom situation."

"I feel that my commitment has increased, largely because my original attitude was that very little could actually be done in my area to modify the situation. Through exposure to other persons attending the institute and instructing it, I have modified this attitude so that I welcome an opportunity to try to acquaint my community with the situation."

"I believe my own commitment has increased in value. More than ever, I appreciate and understand that poverty is a problem of individuals and the community as a whole. I will approach the problem with a better understanding of its implications in the community where I live."

"During the institute I became more and more sure that this was what I wanted -- to help the Youth Opportunity Center and people it could reach. In acting out some of the roles assigned to me in the role playing situations, I realized that I had become more set in my school counseling role than I had known. Though my commitment remains the same, I must evaluate myself further. Can I assume new roles? Am I too set in my ways, or am I just a poor role player when put on the spot?"

"My commitment has increased. The course and the discussions have shown how the difficult problem has various approaches for solving it. It hasn't given me any sense of having a panacea; but with effort in the right direction, progress can be made."

"I feel that I have an increasing desire to try to work with individuals in poverty. This will be more of a challenge than I first thought it would be. I have many new ideas that I would like to try. I feel that I have much valuable information to relate when I return to my home state."

"It certainly has increased. The challenge for lowering my own bias, to create an administrative climate of experimentation and innovation, is something that I have presently committed myself to emphasize on my return home."

"My commitment has increased greatly through the exchange of information and ideas projected in this meeting. While I was not in attendance during the first two weeks, my observations are that this is one of the best institutes which I have ever had the privilege to attend. In my opinion, the University of Colorado did a tremendous job in preparation, presentation, and in drawing out all the resources available to them to present "top notch" instruction."

"I was pretty well committed already. My activities for some time have been closely related to preparing for the administration of this program. My previous education in sociology, psychology, sensitivity training and public administration, made all the materials presented during the third week pretty familiar topics. However, I feel that I have gained re-affirmation of purpose and have received more needed reinforcement -- and determination to proceed with the necessary restructuring and coaching needed at home base to help make this program a success."

Question 4. I like the food.

| | |
|---|---|
| Yes | 26 |
| No | 3 |

Question 5. The announcements and directions were clear and easy to follow.

| | |
|---|---|
| Yes | 29 |
| No | 0 |

Question 6. There should have been more time for recreation.

| | |
|---|---|
| Yes | 15 |
| No | 14 |

Question 7. When you first came to the institute did you have well formulated objectives?

| | |
|---|---|
| Yes | 9 |
| No | 20 |

Question 8. I could have participated more actively.

| | |
|---|---|
| Yes | 16 |
| No | 12 |
| No answer | 1 |

Question 9. Having senior administrators present was a great assistance.

| | |
|---|---|
| Yes | 26 |
| No | 2 |
| No answer | 1 |

Question 10. I feel more time should have been devoted to:

A. More time with basic instructors. (4)

B. More time in field observation. (3)

C. More time in informal small group interaction. (3)

D. More time working in the actual poverty-stricken areas. (2)

E. Miscellaneous

More time considering public relations, psycho-drama, the reasons for poverty, readings, procedures for getting youth into the Youth Opportunity Center, techniques of program evaluation, the creation of innovative techniques, management techniques, a group workshop, psychology -- particularly deviance of individual differences, theory of sociology in administration, more time to rest, time to study distributed materials, more time with Professor Jessor, more lectures from professionals in similar kinds of projects.

Question 11. In the total picture, I think everyone accepted everyone else and made them feel comfortable.

| | |
|---|---|
| Yes | 29 |
| No | 0 |

Question 12. There was too much time pressure.

| | |
|---|---|
| Yes | 16 |
| No | 13 |

Question 13. Most people in the group changed their attitudes and behavior and became more knowledgeable during the institute.

| | |
|---|---|
| Yes | 26 |
| No | 3 |

Question 14. I learned many things which will be helpful in my work relationships with disadvantaged youths.

| | |
|---|---|
| Yes | 29 |
| No | 0 |

Also fellow employees

| | |
|---|---|
| Yes | 28 |
| No | 1 |

Question 15. My most significant learning occurred during or as a result of:

(13) lecture sessions
(0) evening discussion sessions
(1) informal discussions with other participants
(1) field observations
(4) demonstrations with basic instructors
(10) other (combinations of above categories)

Question 16. Discussion with other participants outside the formal group was beneficial to me.

| | |
|---|---|
| Yes | 29 |
| No | 1 |

Question 17. There should have been more planned recreation.

| | |
|---|---|
| Yes | 6 |
| No | 23 |

Question 18. The institute faculty was well chosen for the job.

| | |
|---|---|
| Yes | 29 |
| No | 0 |

Question 19. Too much time was spent in:

(7) A. No complaints -- time well distributed in all areas.
(8) B. Discussions or evening sessions.
(6) C. Psycho or socio-drama.
(6) D. Discussions of police brutality and discrimination.
(3) E. Other.

Question 20. The pressure of time was conducive to the learning situation.

| | |
|---|---|
| Yes | 20 |
| No | 7 |
| No answer | 2 |

Question 21. People improve their awareness of the problems of disadvantaged youth.

| | |
|---|---|
| Yes | 29 |
| No | 0 |

Question 22. There was enough time to discuss with others outside of formal groups.

| | |
|---|---|
| Yes | 23 |
| No | 6 |

Question 23. I think I gained knowledge but without much change in my attitude or behavior.

| | |
|---|---|
| Yes | 7 |
| No | 22 |

Question 24. Most of my learning resulted from:

(9) A. All aspects of the training experience.
(9) B. Lectures in the classroom.
(7) C. Demonstrations with basic instructors.
(4) D. Informal discussions outside the classroom.

Question 25. Inadequate use was made of:

(12) A. all activities used appropriately.
(5) B. specific lecturers -- 5 different speakers mentioned.
(4) C. needed more leisure time.
(3) D. field observation.
(2) E. basic instructors.
(2) F. visual aids.

Question 26. The institute started a change in my attitude toward others.

| | |
|---|---|
| Yes | 26 |
| No | 3 |

Question 27. If I were to plan another such institute I would give more time to the

(17) demonstrations with basic instructors
(13) field observations
(12) informal discussions
(8) lecture sessions
(1) other

Question 28. Were the physical facilities satisfactory?

| | |
|---|---|
| Yes | 22 |
| No | 7 |

If no, why?

(5) classroom occasionally too cold
(2) chairs too hard

Question 29. I participated in all activities as well as I could have.

| | |
|---|---|
| Yes | 17 |
| No | 12 |

Question 30. I felt more "take home" material should have been given in the institute.

| | |
|---|---|
| Yes | 2 |
| No | 27 |

Question 31. The various parts of the institute seemed related to each other.

| | |
|---|---|
| Yes | 28 |
| No | 0 |
| No answer | 1 |

Question 32. I would like to attend a more advanced institute of this type.

| | |
|---|---|
| Yes | 26 |
| No | 2 |
| No answer | 1 |

Question 33. To improve future institutes I would suggest:

1. "Provide better briefing for new instructors about the background of the participants and what immediately preceded them before they arrived at the institute."

2. "Provide more lecture time and more comprehensive reading material."

3. "Select participants who know what job they will have when they complete their institute training."

4. "Be more highly selective in the choice of participants."

5. "Provide more informal lectures, more discussion, and excursions."

6. "Issue a format prior to the institute so the participants will be "warmed up" to the situation."

7. "Only expand program along similar lines and give more time."

8. "Provide more comfortable chairs."

9. "Provide more comfortable chairs and a warmer building. I really don't think one has to live poverty to learn about it."

10. "Provide more instructors who have been actively involved in helping the disadvantaged. Provide less theory and more practicality, e.g., Paul Jacobs and Reyes Ramos."

11. "If possible, have one-half day lecture -- one-half day laboratory experience at a local employment service office, welfare office, juvenile court, etc."

12. "Place more emphasis on people working in the field such as Ramos, Jacobs -- people who are putting theory to practical application."

13. "Provide some rest period during the day -- even a battery needs recharging."

14. "Shorter discussion periods after the lecture."

15. "Allow some evening freedom -- even if the day must be extended."

16. "Provide more intensive small group experience."

17. "Eight hours per day is enough. Night sessions kept me from getting relaxed at the end of the day."

18. "Less control over leisure time, particularly lunch hours and evenings."

19. "Provide techniques of counseling with those who speak, think, and hear differently from the way that I do."

20. "Make more use of basic instructors. Provide opportunities to study the text material and compare it with information received from the basic instructors, lectures, and field observations."

21. "Provide a slightly more adequate classroom. (Need better light and chairs.)"

22. "A follow-up session in April."

23. "Give participants more advanced notice of plans and objectives to permit them better preparation."

24. "Place less emphasis on minority groups. Place more emphasis on the nature of the small group process as an instrument for effecting change."

25. "Spend more time explaining how poverty is created, why it is so persistant, and ways to improve or reduce poverty."

26. "Make a better selection of trainees."

27. "Have earlier evening sessions and a little more thought regarding special needs of women who must have their hair done occasionally."

28. "A more professional attitude is needed on the part of the students, need fewer politicians and comedians."

Question 34. I think the most helpful thing for me to continue my training would be:

1. "Refresher course on sociological theory, administration, and guidance and counseling."

2. "Get planned and organized following this institute."

3. "I need more contact with people in the poverty class based upon the knowledge I have gained in the institute. I need an opportunity to visit these people in their home and community environment, talk with them concerning their viewpoint concerning the future."

4. "More information on techniques of counseling with those who speak and think and hear differently than I do."

5. "I now need to get on with the job of helping disadvantaged youth."

6. "I think we should have occasional get-to-gethers to discuss tactics, attitudes, progress, and ideas."

7. "I now need to get on the job and begin facing the problems -- supplemented by reading and talking with others who have the same experiences."

8. "I now need to begin the activity, make contacts and learn by my own mistakes."

9. "Now need closer contacts with groups and individual youths with whom we are concerned."

10. "I need to start reading at home and keep a record of some kind of what I do and record progress and failures."

11. "To get out and work in the field and have the opportunity to attend the future institutes."

12. "To continue to kibitz training programs that we will soon structure in my state and actively participate to an appropriate degree in the operations of the Youth Opportunity Center."

13. "Set up the Youth Center and become immediately involved in the actual work."

14. "We need continued workshop experiences of this type after some work in the field and we also need to continue to receive written material on the subject between institutes."

15. "Frequent exchange of ideas with individuals working in the field of employment security with unbiased outside instructors to monitor or referee "

16. "Attempt to get official OK to more actively operate outside of the office using the knowledge obtained here."

17. "I need more personal contact with the people who are actually in a disadvantaged position."

18. "I need to take an extension course with the University of New Mexico."

19. "I need to try to digest and implement what I have learned here -- with my more formal education -- and with advanced training at some future institute."

20. "Assignment to the Youth Opportunity Center; advanced training; and discussion to discover and correct weaknesses in certain areas at periodic intervals -- 6 months would be a reasonable time."

21. "I need to apply the learning acquired at this institute and a further acquaintance with current ratings in the field."

22. "We need study groups made up of peers and with such persons as Tom Adams, Bernthal, and Sanfilippo -- to come in and to discuss problems and techniques with us."

23. "I need -- 1. copies of lectures -- 2. the management texts recommended by Bernthal -- 3. opportunity to exchange ideas with my peers -- 4. A six month follow-up meeting of members of this institute to discover the different actions and results."

24. "I need to further develop my knowledge of organization and management, and the psychology of working with individuals in a supervisory capacity."

25. "I need more reading on the subject -- a better knowledge of the areas of poverty in my own city -- a better acquaintance of work being done by other agencies."

26. "I need a little more time to get qcquainted with my own community where I have been for only a short time."

27. "Additional study in field work --."

28. "I now need practical experience combined with formal training."

## Chapter VIII
## Staff Summary

The initial response of the Colorado School participants supports the judgement that the three week program successfully achieved its objectives. Questions designed to assess the meeting of objectives, the increase in knowledge about poverty, commitment to the Youth Opportunity Program, the quality of the faculty, the general program and design, the personal relationships of participants, the nature of the physical facilities received an almost unanimously favorable response. The results shown on the objective test instruments support the participants' subjective evaluation; while sixteen participants felt there was too much time pressure, only seven felt that the pressure had not been conducive to the learning situation.

If the staff were asked to conduct another institute with the same objectives for a similar group of participants, the design we would prepare would be essentially the same. We would wish to have all participants live in the same residential facility and we believe the Oxford Hotel is perfectly suited for this purpose.

We would make more effective use of the evening sessions by assigning specific tasks to the group. This was not practical because of the home demands on a number of the Denver participants.

The staff does not feel that the short planning time detracted from the program in any respect. The shortage of time placed the staff under the same kind of pressure that the participants experienced and we believe this pressure is as important to good planning as it is conducive to effective learning.

It is our judgment that the faculty persons were effective in presenting the content of the program. The opportunity to select lecturers from the nation at large added a certain spirit of urgency and importance to the Colorado School as well as broadness in scope. Participants responded favorably.

The location of the classroom added measurably to the learning atmosphere Its effect was noticeable on faculty, staff, and participants. The same impact could not have been achieved in a classroom on the University of Colorado campus. We doubt it could be achieved on any college campus.

By and large the staff feels that the participants were well motivated prior to the Colorado School. Additional preparation probably would not have made much difference in the overall learning experience.

Participants did express considerable anxiety during the first two weeks of the program. We attribute this high anxiety level to their uncertainty regarding their probable job positions in the Youth Opportunity Centers. In several groups participants knew that one of their number would receive an executive position and since the choice had not been made, they were somewhat reluctant to reveal their ideas and feelings. This situation was unfortunate but probably unavoidable considering the fact that 'youth opportunity center' was only an idea and that plans were still incomplete at the time the Colorado School was conducted.

Finally, the staff would like to address a comment to senior program administrators at the state, regional, and federal levels.

The War on Poverty is a high risk program. Youth Opportunity Programs, if they are directed to the unemployed, or underemployed, high school push outs, will show high failure rates. Whenever risks are high, administrators seek to reduce failure by the imposition of controlling regulations. Innovative ideas cannot be tested when failure is severely punished.

The persons who took part in the Colorado School show every evidence of being imaginative, innovative, and creative. If their natural and acquired ability to develop and execute effective programs for unemployed youth is not evident in their home states, this will not be a result of personal incompetence. Nor will it be a result of the difficulty of the task they face. The reason for failure will be, in all probability, that administrators have intentionally or unintentionally restricted their freedom of action.

One fact is clear. We have been highly unsuccessful in dealing with the hardcore unemployed in the past. As a consequence we have retreated to statistica measures of productivity which absolutely guarantee continued failure. We must not permit this condition to occur in the Youth Opportunity Program. It is, in

our view, essential that administrative agencies at all levels not produce the usual directives and memoranda on how programs should be organized, what staffing patterns should be, what pay scales should be obtained, and what offices cught to contain.

Instead, thoughtfully considered papers concerning the end result which is desired should be the major output of state and federal administrators. The latter is real policy determination. The former is straight-jacketing. There is no need for standardization at this time. On the contrary there is a critical need for startlingly new and different approaches to the problems of unemployed youth. If a superior feels worried and threatened by the innovative schemes of Colorado School participants, this fact will be a symptom that the school was indeed successful.

Appendix I

Employment Security Institute Log

EMPLOYMENT SECURITY INSTITUTE
LOG

Name _____ Date _____

|---|---|---|---|
| Morning | | | |
| Lunch | | | |
| Afternoon | | | |
| Evening | | | |

1. What particular idea(s) of those presented today, would I like to see implemented in my own program? (Please note ideas regardless of source, but be sure to list source.)

2. What problem(s) would be alleviated or solved if this idea could be implemented at home?

3. How could the idea(s) be implemented? What conditions and action would be required?

4. What additional information would I like to have about the idea(s) listed above?

Appendix II

Evaluation Instruments*

*Instruments Schedule A and Schedule D appear in the text above.

Schedule B

University of Colorado
Employment Security Institute
October 5 - 23, 1964

Name_____

You have 30 minutes to write an essay entitled "The Present Structure of Poverty in My Community." Cover these four areas:

1. Describe the poverty in your community as best you can both qualitatively and quantitatively.
2. Explain why this poverty exists, in your opinion.
3. Present your solution to the problem of poverty in your community.
4. Describe what you perceive to be the present obstacles to your solution of the problem.

Schedule C

University of Colorado
Employment Security Institute
October 5 - 23, 1964

Name _____

Write a short answer (two-four sentences) for each of the following 10 questions.

1. "A person's character is set in his early years of life and can hardly be changed in later life. For example, a child who is lazy when he is six years old will be lazy when he is 21 or even 45 or 60." Do you agree or disagree with the statement? Explain why.

2. "It will be virtually impossible to substantially reduce poverty in this country without large scale social changes. Existing bureaucratic organizations in welfare, employment, and education must be given up in favor of some entirely new structure capable of handling the problem." Do you agree or disagree with the statement? Explain why.

3. "The poverty of most families in an urban environment is due to the employment market, lack of skills, training and formal education rather than to the informal group relationships of the unemployed person (home life, influence of parents and close friends, recreational activities.)"
Do you agree or disagree with this statement? Explain why.

4. "For minority groups such as Negro and Spanish-surname populations, there is only a small range of employment opportunities available, and very little variation in their skills and training. Thus an employment officer should pay most attention to the fact that a particular individual is a minority group member rather than to the details of his training and capabilities." Do you agree or disagree with the statement? Explain why.

5. "An explanation of the idleness patterns among the youth in a poverty area of a city must take account of peer group behavior as influenced by their sub-cultures, i.e., their norms of behavior. The idleness of youth cannot be adequately explained by the home environment, personality factors, or the job market." Do you agree or disagree with the statement? Explain why.

6. "To meet the demands of a rapidly changing technology, the average man in the labor market can and must learn new jobs as old ones are eliminated. A rapid change in work roles presents no particular adjustment problem." Do you agree or disagree with the statement? Explain why.

7. "The influence of a person's natural drive and ambition is more important in explaining his chronic unemployment than the influence of his immediate social situation (his relationships with his peers and family, his patterns of security and recreation, etc.). A change in the social situation cannot be expected to affect one's drive or ambition." Do you agree or disagree with the statement? Explain why.

8. "The problem of chronic unemployment and poverty in this country is largely the fault of our culture's way of causing and handling it (i.e., the fault of the 'system' as a whole) rather than the fault of individuals. A substantial solution to the problem can be accomplished with appropriate changes in the system." Do you agree or disagree with the statement? Explain why.

9. "The fact is that there are in this country highly successful professionals (e.g., doctors, lawyers, professors), politicians, businessmen, government officials and so on who are minority group members. But awareness of these successful role models can provide little or no help in motivating the typical Negro, Spanish or other minority group youngster to work hard to succeed." Do you agree or disagree with the statement? Explain why.

10. "Once a way of handling a problem (such as chronic unemployment in a city) has been established in organizational structures, there is a strong tendency for procedures to become stable and then, in time, to become sterile and out-of-touch with the basic problem. Such 'organizational inertia' is more often the basis for the lack of needed change than is the absence of creative reformers who would sweep away the old in exchange for some new plan." Do you agree or disagree with the statement? Explain why.

Confidential: To be used only in the research evaluation of the Institute

Schedule E

UNIVERSITY OF COLORADO
EMPLOYMENT SECURITY INSTITUTE
ON THE MANAGEMENT AND OPERATION OF THE YOUTH OPPORTUNITY PROGRAMS

October 5 - 23, 1964

Name_____

Instructions:

(a) Please answer all questions.
(b) Comment on any question where you wish to elabcrate or explain your answer in more detail.

The information obtained will help in planning better Institutes here and elsewhere.

1. What do you feel were the main objectives of the Institute?

2. Were these objectives achieved, or not? Yes_____ No_____
Please explain.

3. Do you feel that your own commitment to work in Youth Opportunity Programs has increased, decreased, or remained unchanged? Please explain.

4. I liked the food. Yes_____ No_____

5. Announcements and directions were clear and easy to follow.
Yes _____ No_____

6. There should have been more time for recreation. Yes _____ No_____

7. When you first came to the Institute, did you have well-formulated learning objectives? Yes_____ No_____. (If yes, state them here)._____

_____

_____

8. I could have participated more actively. Yes _____ No_____

9. Having senior administrators present was a great assistance.
Yes _____ No_____

10. I would like to have had more time spent in_____.

11. In the total picture, I think everyone accepted everyone else and made them feel comfortable. Yes_____ No_____

12. There was too much time pressure. Yes_____ No_____

13. Most people in the group changed their attitudes and behavior and became more knowledgeable during the Institute. Yes_____ No_____

14. I learned many things which will be helpful in my work relationships with disadvantaged youth. Yes _____ No _____

Also fellow employees. Yes _____ No _____

15. My most significant learning occurred during, or as a result of:
_____lecture sessions
_____evening discussion sessions
_____informal discussions with other participants
_____field observations
_____demonstrations with basic instructors
_____other (specify)_____

_____

16. Discussion with other participants outside the formal groups was beneficial to me. Yes _____ No_____

17. There should have been more planned recreation. Yes_____ No_____

18. The Institute faculty was well chosen for the job. Yes _____ No _____

Any comments? _____

19. Too much time was spent in_____.

20. The pressure of time was conducive to the learning situation.
Yes _____ No _____

21 People improved their awareness of the problems of disadvantaged youth.
Yes _____ No _____

22. There was enough time to discuss with others outside of formal groups.
Yes _____ No _____

23. I think I gained knowledge but without much change in my attitude or behavior. Yes _____ No _____

24. Most of my learning resulted from _____

_____

25. Inadequate use was made of _____

_____

26. The Institute started a change in my attitude toward others.
Yes _____ No _____

27. If I were to plan another such Institute, I would give more time to the (choose one or two)
_____lecture sessions
_____evening discussion sessions
_____informal discussion
_____field observations
_____demonstrations with basic instructors
_____other (specify_____

_____

28. Were the physical facilities satisfactory? Yes _____ No _____
If no, why? _____

29. I participated in all activities as well as I could have.
Yes_____ No_____

30. I felt more "take home" material could have been given in the Institute.
Yes _____ No_____

31. The various parts of the Institute seemed related to each other.
Yes _____ No _____

32. I would like to attend a more advanced Institute of this type.
Yes _____ No _____

33. To improve future Institutes, I would suggest:_____

_____

_____

34. I think the most helpful thing for me to continue my training would be

_____

_____

The following schedule was supplied to the Institute by the Labor Department in Washington. It may prove most useful for comparing the various institutes held across the country. We therefore have given little effort to analyze the results of this instrument other than recording simply the numbers for the "yes-no" answers. The response was returned to Washington for further analysis.

This instrument was designed as a before and after measurement. Due to the fact that the Colorado School got started rapidly, we did not schedule in the time to administer it at the beginning of the Institute. Consequently, there was no way for us to make a comparison of the before and after responses. The after responses are being sent back to the Department of Labor for what use they may be in comparison with their other schools.

Schedule F

U.S. DEPARTMENT OF LABOR
BUREAU OF EMPLOYMENT SECURITY
Washington, D. C. 20210

This is your final evaluation of the Institute. We are hopeful that the organizers and the administrators of this Institute have been sensitive to your needs throughout the period of time the Institute was in session. We are quite concerned with the ability of the Institute to prepare you for the job ahead, which in essence will be providing employment services to the disadvantaged youth. Your evaluation of the results of this Institute will aid greatly in the improvement of both the design and the content of future Institutes.

## FINAL EVALUATION

PLEASE DO NOT SIGN YOUR NAME

A. Scope and Goals of Program

(1) What do you conceive the objectives of this Institute were?

(2) In terms of your understanding objectives do you feel that the Institute achieved them?
Please give your reasons. (Either way)

Yes - 29
No - 0

(3) In terms of your objectives and beliefs do you think the Institute reached them?
Please give your reasons.

Yes - 29
No - 0

(4) How do these objectives compare with what you expected to gain from this Institute?

Positive Responses - 25
Had no expectation - 3
Negative Responses - 0

(5) If you feel the objectives of the Institute should be changed in the light of your experience, what do you recommend as the changes that should be made?
Please give your reasons.

Change - 11
No change - 18

B. Organization and Administration

(1) Were the physical facilities adequate?
Suggestions for improvement.

Yes - 24
No - 5

(2) Should there be changes in scheduling which will improve the training?
Please give your reasons.

Yes - 17
No - 12

(3) What recommendations do you have for the improvement of the organization and administration of the Institute?

C. Training Processes

(1) Do you find the material presented by speakers was at the right level; at too low a level; at too high a level?

Just right - 26
Too high - 3
Too low - 0

(2) In terms of the content of the Institute lectures how would you rate your assimilation in as far as your future application of the subject matter is concerned?
Please explain.

Average - 18
Above average - 11
Below average - 0

(3) How has the Institute prepared you to perform in the Youth Opportunity Program?
Please specify.

(4) Are you satisfied with your experience in your particular sub-group and with the results obtained?
Please explain.

Yes - 14
No - 0
No answer - 15

(5) Are you satisfied with the work of your particular committee?
Please explain.

No committees

(6) Has the Institute met your expectations as to content of lectures presented?
Please explain.

Yes - 28
No - 0
No expectations - 1

(7) Do you feel that the Institute was instrumental in clarifying your own feeling to yourself regarding the needs and the nature of the problems of the disadvantaged youth?
Please explain.

Yes - 28
No - 1

(8) Do you feel the Institute was instrumental in clarifying your understandings regarding CAUSE trainees?
Please explain.

Not applicable

(9) Do you feel the Institute was instrumental in clarifying your own feelings regarding the job ahead?
Please explain.

Yes - 17
No - 0

(10) What suggestions do you have for the improvement of the Institute process?

# PREFACE

This bulletin deals with the training of technicians through full-time pre-employment programs beyond the high school. It is designed as a planning guide and describes the principles and procedures utilized in developing such programs. It is concerned with the development of programs for training persons for the various types and levels of technician occupations found in American industry.

The procedures outlined cover planning for technician training programs wherever found, in technical institutes, community colleges, junior colleges, and area vocational-technical schools which serve the needs of post-high school students and adults. The purpose of the bulletin is to provide guide lines for the educational administrator who is concerned with establishing programs to meet the growing needs in this important field. Selected references lead the way to more intensive study of specific aspects.

The manuscript for this bulletin was originally prepared by Dr. Lynn A. Emerson when he was serving as Consultant, Area Vocational Education Branch, Division of Vocational Education, United States Office of Education. He was assisted by other members of the staff, with special recognition to Frank J. Coyle for his valuable contribution.

Sincere appreciation is expressed to Dr. Walter M. Arnold, Assistant Commissioner for Vocational Education, United States Office of Education, for permission to use the manuscript for this publication.

Gerald B. James, Director
Division of Vocational Education

# CHAPTER 1. PROGRAM PLANNING--AN OVERVIEW OF ITS NATURE, SCOPE AND PROCEDURES

The purpose of this chapter is to provide a general overview of the nature and scope of program planning for the pre-employment training of technicians, and of some of the procedures involved. Subsequent chapters provide a more extensive treatment of the phases outlined here.

The programs with which this bulletin is concerned provide training for a growing group of industrial workers which have come to be known as technicians. The duties and requirements of their jobs are akin to those of engineers, but usually of narrower scope. Some of the jobs require limited manual skills similar to those needed by skilled mechanics. The work of the technician is essentially technical in character, thus the planning of programs for the training of technicians follows the general pattern used for engineering training, yet incorporates certain of the techniques used in planning skilled trades training.

The programs seek to provide opportunity for the student to acquire the knowledge, understandings, manual skills, technical skills, attitudes and appreciations needed by technicians. Each program is usually aimed at a group or cluster of technician occupations which have a substantial body of content common to all of them. The objective of the program is to develop trained versatility in dealing with the tasks found in the occupational cluster.

Organized education programs arise when the need for training exceeds that which can be provided through informal learning on the job. They develop in response to pressures of one sort or another. The source of pressure for the development of technician training programs is the need of industry for trained personnel in this field, and this need finds expression when industry is no longer able to provide through its own efforts the trained personnel it requires. The need for organized training comes into the limelight when rapid technological change creates new occupations; or when rapid expansion of production is demanded by national defense or other emergency. In a specific geographical area the need may arise when new industries come into the community, or when established industries take on new types of work. Sometimes the stimulus comes from funds made available through legislation which is enacted in response to state or national industrial needs.

The approach to program planning for technician training will vary in accordance with conditions existing in the area in which the proposed program will be located. If the program is to limit its service to supplying trained personnel only to the immediate geographical area, the needs of this area must be made known. Thus a survey may or may not be needed, depending on how much information is already available. If the area already has technician training programs in certain occupational fields, the task of planning a program for a new field is much smaller than if no programs have previously been developed. In areas where the junior college is an accepted institution for vocational education, the planning task is different from that of an area where all vocational education is on the high school level.

The approach that is used in program planning in a given community thus depends upon many factors.

Organized planning for the development of technician training programs involves a number of steps carried out in a logical sequence. Here are some of the steps, discussed at greater length later in this bulletin.

Identifying technician occupations.

The occupations for which training is to be provided need to be clearly identified. Industry's needs are usually stated in broad terms. Study will need to be made of the characteristics of the occupational groups in which the personnel lie so that the specific jobs can be identified as within the area encompassed in the proposed program.

Determining the geographical area to be served.

This involves determination of the political unit which will operate the program--city, county, State, or some other unit--and which will provide the financial support, often assisted by subsidy from Federal or other funds. Most of the students in the program will normally come from homes located in this political unit.

Consideration may also need to be given to the placement market to be served by the graduates of the program. This is usually much larger than the area from which the students come. Technically trained persons often migrate long distances to accept positions.

Making occupational surveys to determine specific needs for technicians.

Broad surveys of needs for technicians, conducted on a State-wide or nation-wide basis, are sometimes available for certain fields. But since the programs should primarily meet needs close to home it may be desirable to make surveys of the industries located in the area to determine in more specific terms the kinds of technicians needed and the extent of the shortages.

Determining the occupational groups for which training is to be provided.

No single institution can provide training for all the existing technician occupations. Selection must be made of those groups which appear to be needed most and for which it is practicable to provide training.

Making surveys for availability of students.

Technician training programs serve two purposes; (a) to provide opportunity for young persons in the community to get training, and (b) to supply industry with trained personnel. No program can operate successfully unless it has a sufficient number of qualified students, and steps need to be taken in the planning procedure to insure that an adequate supply of potential students is available.

Surveying the area for presently-available technician training programs.

This is an important step although it may take little time and effort. If training facilities already exist which may be made available to youth in the community, consideration may well be given to utilizing such resources rather than setting up new facilities. Cooperation between educational administrative units, scholarships in private institutions, or other ways might be utilized. Results of this survey may lead to a decentralized system of offering training wherein a number of qualified institutions in an area coordinate their training plans to eliminate duplication or overlapping.

Analyzing the occupations for training content.

The development of curriculums is based upon occupational analysis, but this analysis must be made with the specific purpose in mind of determining the content needed in a training program which prepares persons for effective entrance into these occupations. Such an analysis attempts to get a true picture of the knowledge, understandings, manual and technical skills, attitudes, and the like, which are essential for a worker in the occupation. It is best done by a trained analyst working with persons who are thoroughly familiar with the occupation.

Developing the curriculums.

The curriculum is a scheduled composite of the courses needed to provide a well-organized training program in a specific area. It thus grows out of the needs of the person in the technician occupation. It includes the technical content together with the basic science and mathematics needed, and may contain units of general education character. The courses are of appropriate length and level, arranged in orderly sequence to facilitate ease of learning.

Curriculums may be developed entirely from occupational analyses, supplemented by appropriate mathematics and science. They are often constructed by piecing together portions of similar curriculums in other institutions. Perhaps the best technique is a combination of occupational analysis and ideas obtained from curriculums in other institutions.

Developing the course outlines.

Courses of study are the package units which make up the curriculum. They are developed from analysis of the detailed work life of technicians to determine the specific knowledge, skills, etc., needed. Course content in science and mathematics stem from the technical content, which is analyzed from the specific basic and applied science and mathematics needed to understand the technical content. The course content is arranged in appropriate teaching order, which is somewhat dependent upon the method of instruction used.

Selecting methods of instruction for specific courses.

Technician training programs are taught by classroom lecture and discussion, laboratory work, shop work, drafting room practice, and field work. The

method which is most appropriate for reaching the desired educational objective depends upon the nature of the content, and sometimes is influenced by the facilities which can be made available. Laboratory work finds an important place in technical training curriculums.

Coordinating technician training programs in the total program of the institution.

When the new program is to be a part of an existing institution which already is offering training in fields somewhat akin to the new program, consideration needs to be given to fitting it into the total picture in the best manner. Sometimes it is possible to utilize a specific course in more than one curriculum, especially if it is a basic course. Care must be taken, however, to make sure that such dual use does not detract from the effectiveness of the course in the new program.

Locating and developing instructional materials for specific courses.

In many fields of technician training there appears to be a definite shortage of appropriate instructional materials. Many textbooks are available for engineering courses and a considerable variety of instructional materials can be obtained from skilled crafts training. Much needs to be done in the development of suitable textbooks, laboratory work books, and other types of printed materials of types and levels suitable for technician training programs. Thus in setting up new programs attention needs to be given to locating such materials, or to planning for their development.

Determining plant and equipment needs.

Ideally, equipment needs are determined from study of specific aspects of courses of study. Plant needs emerge from the housing necessary for the effective utilization of the equipment, together with suitable space for classroom work, drafting room work, library study, and other services. In practice, however, compromise must be made in terms of available existing plant, and sometimes available equipment. It must be kept in mind that the plant and equipment needed for technician training are more nearly like that needed for engineering programs than that commonly found in vocational schools.

Planning personnel needs for the program--administrative, supervisory, instructional.

Since training programs for technicians are new to many educational systems, it is important to clearly identify the needs of the personnel required to operate the program in terms of their education backgrounds, work experience, interests and attitudes. Standards for instructors need to be carefully worked out, and consideration given to sources of qualified personnel. Care needs to be taken to insure that administrative and supervisory officials who deal with the program understand fully the nature and requirements of the task, and have a real desire to make the program succeed.

Setting up student recruiting, testing, selection, counseling and placement procedures.

This is an important aspect of any technician training program. Relatively few guidance counselors really understand the nature of technician occupations and the programs for training technicians. Thus any new program in this field faces the task of developing understanding and cooperation on the part of the schools which graduate students who will later enter the technician training program. Standards of admission are somewhat similar to those needed for engineering, and differ considerably from those for the skilled crafts. Placement of graduates of the technician training program is an essential function, and the placement market usually includes geographical areas outside the district which operates the program.

Establishing effective relationships in the community.

Any new program should be especially sensitive to community relations. Industrial management, pertinent labor union organizations, appropriate community agencies, and the general public need to be kept informed concerning the program. Many types of cooperation are needed. Representative advisory committees or specialized consultative services--for the school as a whole and for specific curriculums--usually are desirable.

In planning any new educational program the most effective results are usually obtained when the planning follows a sequential development of the various items that need to be considered. The sequence outlined in the preceding steps has been found to be useful. But it must be remembered that it is not always practicable to take one item and follow it through without consideration of pertinent other items. So the program planner works concurrently on some of the items, always keeping in the mind the necessary interrelationships.

FIG. 1 -- HOW TECHNICIANS GET THEIR TRAINING

# CHAPTER 2. IDENTIFYING TECHNICIAN OCCUPATIONS

Supplementary to the engineering and scientific professions, and dealing mainly with applications of science, mathematics and technology to various types of industrial tasks, is a group of occupations which have come to be known as technician occupations. In certain ways they are akin to the skilled crafts, for many of them require some manipulative skills, mainly in the use of hand tools in the installation and adjustment of highly technical equipment. But the main function of the technician is to utilize the principles of mathematics, science and technology in dealing with his tasks. His work is thus more nearly like that of the engineer, for he is concerned with technical skill, which may be defined as the ability to apply technical knowledge to specific tasks.

Some technician occupations lean toward the engineering type, such as those which consist chiefly of design, computation, analysis, or laboratory testing. Others border on the skilled crafts, such as jobs which deal with installation or trouble shooting of mechanical, electrical, or electronic equipment where much technical "know-how" is demanded but which require some manual skills. Figure 2 shows some rough comparisons of the amount of manipulative skill and of technical skill needed by groups of semiskilled workers, skilled craftsmen, technicians, and engineers.

In comparing the skilled craftsman with the technician it will be noted that occupations in which the proportion of worker effort devoted to technical skill rises above the fifty per cent mark are classified as being in the technician category. This is an arbitrary figure, but serves to illustrate the broad differences in the occupations. It is noted also that there are wide differences within each of the groups shown in the figure with respect to distribution of manipulative and technical skill. Some craft jobs approach those of the technician, and some technician jobs approach those of the engineer.

Technician occupations are not easy to identify. They are found under a wide variety of payroll titles, most of which do not include the word "technician." They cover a wide range of activities, and of types and levels of technical content. Difficulty often occurs when studying technician jobs because employers do not identify them as "technician" work. Here are a few of the many technician job titles, of varying type and level:

- Air conditioning technician
- Chemist assistant
- Building inspector
- Estimator
- Structural draftsman
- Topographical draftsman
- Surveyor
- Project planner, data processing
- Programmer
- Electric power technician
- Electrical draftsman
- Electronics technician
- Mechanical draftsman
- Tool designer
- Mechanical technician
- Production planner
- Time study man
- Safety inspector
- Writer, technical manuals
- Process description writer
- Specification writer, electrical
- Cloth designer
- Electronic equipment salesman
- Industrial photographer

FIG. 2 — MANIPULATIVE SKILL AND TECHNICAL SKILL REQUIREMENTS OF OCCUPATIONAL GROUPS

| | |
|---|---|
| Fixture designer | Research assistant |
| X-ray technician, industrial | Electrical engineering aide |
| Laboratory assistant, metallurgical | Tool inspector |
| Laboratory tester, food | Pilot-plant operator |

The kinds of technical ability found in the various technician jobs are of considerable variety. Some jobs emphasize analysis and diagnosis. Some require visualization of drawings, or a flair for creative design. Some demand a high degree of applied mathematical ability. Some require extensive understanding of industrial equipment and processes. Some require knowledge of the skilled trades. Sometimes the job involves supervisory responsibility, and combines technological understanding with skill in dealing with people.

Some occupations in the vocational-technical field are very limited in the range of content which is dealt with and the amount of intellectual ability or technical skill required. Others demand that the worker deal with a considerable variety of subjects, and have a high degree of scientific understanding and technical skill. The amount and type of education needed for these occupations varies greatly. Thus in getting a picture of the whole field one must look at these great variations in the scope of the jobs--the range of content dealt with--and the level of the job, which reflects the intellectual ability needed.

Occupations which deal with technical processes and are of very limited scope and level include such jobs as certain types of product inspection, where the work deals with a few specific products and a limited number of inspection instruments; or such jobs as routine engine testing, where the worker checks specific items of engine performance following established standards. In these jobs the worker uses relatively little independent judgment, and a low level of technical ability. They might be classified as <u>low-level technical jobs</u>, and not within the broad category of technician occupations. (See Fig. 3)

Other occupations deal with a fairly narrow scope or range of technical content but require a high level of ability within that range of content. For example, the television maintenance technician may deal only with the servicing of television receivers, but he is required to know a great deal about electronic principles and their application to television receivers, about troubles that are found in such equipment, and about test instruments and their use in locating trouble. Such a person needs a fairly high level of technical competency, even though his work is largely limited to television receivers. An occupation of this type might be described as that of a <u>technical specialist</u>, to differentiate it from that of a more broadly trained person who is competent to deal with other applications of electronics such as television station operation and electronic industrial control systems, as well as servicing television receivers. This latter person might be called an engineering technician.

The higher grade technicians whose jobs cover relatively wide scopes and which require a high level of mathematical, scientific, and applied technology ability are frequently called <u>engineering technicians</u>. Such jobs as engineering

A. Low-level narrow-scope technical occupation, not classified in the technician group.
B. Technical Specialist )
C. Industrial Technician ) May be classified as technician occupations.
D. Engineering Technician )

FIG. 3 - TYPES OF TECHNICAL OCCUPATIONS BELOW THE PROFESSIONAL LEVEL

aide, tool designer, instrumentation technician, and electronics technician are in this category. These technicians require a fairly broad education, including basic science and mathematics of post-high school level and considerable breadth of applied technology. Their training is broad enough to prepare them to handle a considerable range of tasks within their general fields of technology, as assistants to engineers or scientists, or in other work of a varied type.

Another group of technician occupations, filled by workers who are sometimes called industrial technicians, have a somewhat narrower scope of activities and a somewhat lower level of technical content than that required for engineering technician occupations. The work deals more with production processes and process control than with product design. The training program involves less mathematics and science and a more limited range of technology than that needed by the engineering technician, yet it has considerable breadth and depth. Such occupations might include quality control, technical supervision and similar jobs.

It should be kept in mind that the classifications of technician occupations outlined above are not all in common use and are presented here simply for the purpose of trying to give a reasonably clear picture of the diversity of technician occupations.

Technician occupations are found in a wide range of work fields--manufacturing, construction, agriculture, health, maintenance and service, research laboratories, and government. Within a specific field, technicians of one type or another are found in many phases of the work. (See Figs. 4 and 5) Programming of computers, writing of technical manuals, purchasing of technical equipment, cost accounting in technical industries, technical sales, and technical illustration are examples of special types of technician occupations. The growing field of astronautics is opening up many jobs for persons with technician training.

The specific tasks performed by technicians are many and varied. Here are some of them, taken from a variety of technician occupations:

- Making freehand sketches
- Preparing working drawings
- Interpreting drawings
- Taking details from master designs
- Plotting curves and graphs
- Planning wiring or machine layout
- Recording and compiling data
- Making computations
- Designing fixtures and gages
- Designing tools and dies
- Designing details of machines
- Designing instrument installations
- Diagnosing trouble using instruments
- Interpreting instrument readings
- Calibrating instruments
- Estimating materials requirements
- Estimating costs
- Inspecting materials
- Determining suitability of materials
- Making cost control studies
- Constructing experimental equipment
- Performing laboratory analyses
- Operating complicated technical equipment
- Analyzing customer needs for technical products
- Selling technical equipment

FIG. 4 TECHNICIANS ARE FOUND IN ALL PHASES OF PRODUCT DEVELOPMENT, MANUFACTURE AND MARKETING

# THE TECHNICIAN

# IN INDUSTRY

FIG. 5 — SOME OCCUPATIONAL FIELDS AND TECHNICIAN JOBS

| | |
|---|---|
| Installing technical equipment | Writing technical manuals |
| Adjusting technical equipment | Making time and motion studies |
| Testing installed equipment | Preparing technical reports |
| Checking product conformance to specifications | Supervising the work of others |

No single technician performs all of these tasks, but they are illustrative of the type of activity which characterizes technician jobs. It will be noted that the tasks are concerned with drawing and design, with materials, with technical equipment, with instruments and gages, with production processes, with production planning, with relations with other persons, with communication of information and ideas, and with other items. The technician is thus a person who needs trained versatility. He needs specific technical abilities, but he also needs versatility, the ability to deal with a variety of situations.

To help differentiate between skilled crafts and technician occupations, a list of typical occupations in metal products manufacturing might be used.

METAL PRODUCTS MANUFACTURING

| Skilled Crafts | Technician Occupations |
|---|---|
| Toolmaker | Tool designer |
| Machinist | Draftsman |
| Molder | Inspector (tools) |
| Patternmaker | Time and motion study man |
| Steamfitter | Assembly technician |
| Plumber | Expediter |
| Millwright | Maintenance technician (automated machines) |
| Electrician | Technical supervisor, etc. |
| etc. | |

Although all the crafts jobs involve some technical skills, it is evident that in the technician occupations listed above the technical skills predominate.

A similar listing of typical craft and technician occupations in the construction field might show the following:

CONSTRUCTION FIELD

| Skilled Crafts | Technician Occupations |
|---|---|
| Bricklayer | Architectural draftsman |
| Stonemason | Structural draftsman |
| Tilesetter | Architect's aide |
| Plasterer | Estimator |
| Carpenter | Building inspector |

| | |
|---|---|
| Painter | Building materials salesman |
| Plumber | Air conditioning technician |
| Steamfitter | Construction supervisor |
| Sheetmetal worker | Materials man |
| Structural steel worker | Expediter |
| Welder | Specification writer |
| Electrician | etc. |

In surveying the needs for technicians and in gathering data for the planning of programs for technician training, it is desirable to utilize criteria to determine whether a given job falls within the technician category. A check list for this purpose is shown in Fig. 6. In using this check list the occupation is analyzed with respect to whether or not it requires the understandings and abilities listed. If the majority of the items are checked as being needed in the occupation it may be classified as being of technician character.

If the majority of the following items are checked in the affirmative, the occupation may be classified as of technician character.

Does the occupation require intensive training in technical subjects involving the direct application of specialized functional aspects of science, mathematics, and advanced technical skills and information based upon: Yes___ No___

___a. Analysis and diagnosis of situations and problems requiring technical understanding -

___b. The ability to use standard technical handbooks and similar materials effectively -

___c. Frequent decisions with respect to technical problems -

___d. Concern with a variety of technical situations often involving many factors and variables -

___e. The use of a variety of instruments -

___f. Interpretation of plans and drawings -

___g. Visualization and creative design -

___h. An understanding of equipment -

___i. An understanding of materials and processes -

___j. Cost analysis in addition to technical understanding and technical skill -

___k. The ability to render technical assistance to engineers, scientists, or other professional personnel engaged in scientific research or production -

___l. The ability to supervise or communicate with others effectively in oral and written form, including the use of graphics, in matters pertaining to technical activities.

FIG. 6 -- SUGGESTED CRITERIA FOR IDENTIFYING TECHNICIAN OCCUPATIONS

# CHAPTER 3. IMPORTANCE AND USE OF ADVISORY COMMITTEES

Since technician training depends so much upon its cooperation with industry, it is important that the knowledge and counsel of employers and others be sought in an organized manner. The representative advisory committee serves this purpose. A functioning advisory committee will not only enable the school to keep abreast of new and changing technologies, but it will promote good community relationships and furnish objective criticism that can be used to improve technician training programs.

The importance of advisory committees is emphasized in the booklet--"Vocational Advisory Committees"--published by the American Vocational Association. It states, "Vocational education more than any other type of education needs close cooperation with the community. It trains workers for specific jobs and productive lives. It needs the periodic help and criticism of the real workaday world to be sure that its training courses are up to date and that its preparation for a life-work is useful." Such help from advisory committees is especially needed in the field of technician training, where technology is changing at a very rapid rate.

There are several kinds of advisory committees, each of which serves a different purpose. There is the general committee serving the entire school. There is the specific occupational advisory committee. There may be other committees dealing with a particular phase of the program, such as a new building committee or an occupational survey committee. It is often possible to organize these committees so that the various special committees will have representation on the general committee.

As the title suggests, the general advisory committee deals with matters which affect the school as a whole. It may advise on occupational surveys which may be needed, on planning for expansion of program offerings or planning a new building. It may render assistance in gaining public recognition and acceptance of a new program, or in securing support for financing programs. The kind of representation needed on general advisory committees is broad, covering all the pertinent segments of the community which have bearing on the program. Management representatives from specific industries, leaders of labor organizations with which technicians are affiliated, persons from pertinent professional technical associations, representatives of the public employment service--these and others may well be considered for membership on the general advisory committee.

The special advisory committee is organized to meet a specific need, such as the planning and functioning of a single curriculum, for example electronics technology. Personnel for such a committee are selected from persons who are intimately acquainted with the specific technical field, with industrial needs and practices. Their functions deal with technical advice and counsel, and they may be concerned with such things as curriculum planning, course content, instructional materials, equipment selection, instructor qualifications, student qualifications, and placement of graduates. The special advisory committee for a specific technical field usually works closely with the instructional staff in that field in the school.

In a local situation the advisory committee works with the school person responsible for the program--usually the local director of vocational education or the principal, who usually acts as secretary of the committee. He sets up the agenda for meetings, keeps the committee informed about school matters, makes arrangements for meetings, takes the minutes, and prepares the reports of the committee.

The function of the advisory committee is to give advice. It should be clearly understood that it does not have administrative authority. The committee can and should make recommendations, but the responsibility for action rests with the legally constituted school authorities. It deals with important problems faced by the school, and should be provided with all information it requests concerning the program. The committee exists because it furnishes an avenue of information and contact not otherwise readily obtainable. Its conclusions and recommendations should be treated with respect.

Advisory committee members are important persons in the community. Usually they are busy people. They are giving their time and energy without compensation, as a civic service. The problems they are asked to discuss should be important ones, sufficiently so that they will be challenged by the tasks laid before them. The successful operation of the committee will depend largely upon the school representative who works with it. He must make each meeting a challenge to justify the expenditure of time by important individuals.

The committee members of general and special advisory committees should be appointed by the school authority, and it is well to have a definite term of service, such as three years. The terms of individual members should not run concurrently. This will assure fresh points of view and enable the dropping of inactive members. There should be no objection to renewing an appointment of a member who has made outstanding contributions to the work of the committee.

The size of the general advisory committee is usually larger than that of the special committee which deals with a specific curriculum or special phase of the program. The general committee should be large enough to include representation from groups and agencies which are intimately concerned with the program as a whole, but should not be so large as to become unwieldy in its functioning. Six to ten persons usually will provide such representation. The special committees which work with limited aspects of the program usually are smaller. Four to five persons should be sufficient for such committees.

The proper selection of committee members is important. They should have a real interest in the school and its problems. They should be persons of standing, who are respected by their associates. They should have the ability to work together as a team.

Since advisory committee members serve without pay and are important persons in the community, every effort should be made to make the committee meeting effective for the school and rewarding to the committee members. Careful advance planning of the agenda, preparation of data and materials needed for the meeting, adequate notification of members concerning meeting dates, scheduling the meeting at hours when the members can give sufficient time to

discussion of the problems, seeing that the meetings are conducted with dispatch and effectiveness--these are some of the things which make for efficiency in working with advisory groups.

In addition to the use of advisory committees, the school organization may well consider the utilization of special individual consultants for specific purposes. Such consultants might be used in helping to plan occupational surveys, in curriculum development, in appraising the effectiveness of programs, and in other ways. They should be persons who have had wide contact with technician training programs, who have a sound approach to the tasks of program development and operation in the technician training field, and who have the personality traits necessary to work effectively with the local school officials. Often such consultant service, even though used for very short periods, is well worth its cost.

## CHAPTER 4. DETERMINING THE GEOGRAPHICAL AREA TO BE SERVED

In planning any program for the training of technicians, careful consideration needs to be given to the geographical area to be served. The program serves to meet two needs: 1) those of the youth and the employed workers who want the training; and 2) those of the industries of the area in which the program is located. Training programs for technicians usually also serve to meet needs of industries located at a distance from the place where the training is given. The interest of the taxpayers who finance the program has considerable influence upon the geographical area to be included. They are more concerned with providing the educational services required to meet the needs of local industries than to meet needs of industries outside the area.

In determining the geographical area to be included in the program, several items need to be considered. Among these are the numbers of potential students available for the program, the placement opportunities for graduates, the number of employed workers needing extension training, the existing school administration patterns, the potentialities of cooperative effort between existing educational administrative units, and potential financial support of various types.

The size of the program in terms of student body and of curriculum offerings has distinct bearing on the size of the district served, especially in the case where a new school is proposed. Efficiency of operation as well as effectiveness of program from the educational standpoint require a program of optimum size. The range of curriculum offerings should be large enough to make adequate impact on the general public and on the industries concerned. The student body must be of sufficient size to warrant economical operation of all the courses which make up the curriculum, advanced as well as basic courses. Retention of students in the second year of a two-year program frequently runs about 60 per cent. Good technician training programs require careful selection of students of reasonably high ability, thus the base from which students are recruited must be large enough to provide for such screening.

The availability of students is influenced by the policies established with respect to non-residents of the district. Liberality in such policies may help in building up a desirable enrollment, for large geographical areas of the United States are not now provided with facilities for technician training. Availability of transportation within the proposed district is of importance; and since many students will use automobile transportation, accessibility of good highways needs consideration.

The placement market for graduates of technician training programs is usually much wider than the geographical area of the district which operates the program. This must be taken into consideration when planning programs, as well as the needs of the industries in the district. The character of the local industries will affect greatly their ability to absorb graduates of the day programs, and their ability to furnish students for extension courses offered in the evening. An area with industries which employ considerable numbers of technicians - research laboratories or electronics manufacturers,

for example - provide greater opportunity for effective utilization of technician training programs than does one with industries which have few technician jobs - such as shoe factories or lumber mills.

The geographical area to be served by the proposed technician training program is often determined largely by the existing educational administrative patterns for providing education beyond the high school. If the community already is provided with post-high school educational facilities in other fields than technician training, the area served by such programs may well be considered for the technician program. Such educational administrative units might be a junior/community college district, a county-wide operated school program, a State-wide system of State-operated vocational schools, an area vocational school, or some form of organized cooperative effort on the part of several local school districts such as a "jointure," an "intermediate unit," a consolidated district, or a board of cooperative educational service. In any case the geographical area for the program should be large enough to support an economical and efficient program.

The size of the district is influenced greatly by the financial support needed for the program. The nature of the program and the extent of the placement market for graduates of the day program indicate the need for financial aid from State or Federal sources, but the primary source of support is the local tax district. Thus the size of this district should be in keeping with the financial needs. The assessed valuation of property in the district on which the tax levy is made is thus an important element. It must be kept in mind that capital outlay and operating costs for post-high school technical programs are considerably higher than those for high school education.

# CHAPTER 5. MAKING OCCUPATIONAL SURVEYS FOR DETERMINING NEEDS FOR TECHNICIANS

Before any pre-employment training program of vocational education is established it is essential to know whether or not the graduates can find employment. In many cases it is necessary to make occupational surveys in order to secure such information. Surveys are time-consuming and expensive, and the resulting information ought to be of type and quality commensurate with the cost. Before any extensive survey is undertaken by school authorities who are concerned with possible development of technician training programs, all existing sources of data already compiled should be carefully studied. If such sources do not provide the data needed, a survey of industries should be undertaken.

The purpose of the survey is to determine the kinds of technician positions present in the industries, the numbers employed in these positions, and the annual replacement needs for new workers who might be trained in the proposed program. It should also seek to determine the probable numbers of employed persons who need extension training in the technician field, and the general nature of the extension courses needed. Although this publication is concerned mainly with pre-employment program planning, it is suggested that data on potential enrollees in extension courses be gathered at the same time, for evening classes are invariably provided in technician training institutions which are located within reach of persons employed in these occupations.

The appointment of a representative advisory committee for the survey is a desirable practice. Such a committee should include representation from large and small employers, manufacturers or trade associations, organized labor, the public employment service, and other pertinent community groups, as well as personnel from the educational institution sponsoring the survey. The advisory committee can provide valuable help in planning the survey, getting favorable reaction toward the survey on the part of employers and others, and implementing the recommendations which emerge from the findings. It should be made up of very able persons who are respected in the community and whose background will enable them to give sound counsel.

If the survey is an extensive one and the work entailed will be of some magnitude, it may be desirable to have a working committee in addition to the general advisory committee. This is a small committee which can meet frequently to deal with problems which arise which do not require the attention of the larger group. It helps to design the survey pattern and implement the work of the survey.

Early in the planning process it is necessary to clearly outline the purposes and scope of the survey. The main objective is to secure data which may be used to determine the training needs for technicians. Among the items on which information is needed are the following:

Occupational titles of technician jobs found in the community
Numbers employed, by groups of occupational titles
Replacement and growth needs for technicians

Sources of present technicians
Total numbers of employees in the establishments
Numbers and types of persons now employed who need extension training in the technician field
Training programs for technicians now offered by the employed organizations

Before it is possible to develop the curriculums and courses of study for the proposed educational program it will be necessary to gather data on specific tasks done by the technicians found in the community, and the kinds of technical knowledge, mathematics and science which these technicians need in order to perform their tasks effectively. Sometimes this kind of information is gathered at the same time as are the data on numbers of technicians needed. Often, however, a separate study is made of these items, after needs for technicians have been ascertained and decision made concerning the types of curriculums to be offered.

The survey planning process must determine the extent and scope of the survey. The geographical area to be surveyed, the types of industries to be included, and the occupations to be included which lie outside the technician field (such as the skilled trades), must be determined. When the survey is being made by a city board of education, decision must be made as to how far to go outside the city limits. Often the large industrial establishments are found in the suburbs rather than in the city proper. The industrial areas outlined by a chamber of commerce or an employers association help in defining the survey area.

In some cases the survey may be limited to those types of industries in which technicians are found in substantial numbers. In other surveys, it may be desired to get a fairly complete picture of all the technicians in the area and thus the industrial scope would be larger, taking in those industries in which only a few technicians are employed.

Technicians are found in many fields of activity - industry, agriculture, business, the medical and health field, and others. Most recent surveys have been limited to industrial manufacturing and service occupations. In the years ahead it is probable that other fields may be surveyed as well.

Selecting the sample of the establishments to be surveyed is important, for it is usually impossible to contact every one, and a poor sample may well lead to erroneous conclusions. An acceptable procedure is to include all the larger establishments (employing 100 or more persons) one in five of those employing 20 to 99 workers, and one in 25 of those in which fewer than 20 are employed. Local circumstances, however, may make it desirable to use different proportions. Whatever the pattern used, it is essential that the selection be made in accordance with good sampling procedure.

The cost of the survey is influenced by the geographical and occupational scope, by the depth of coverage of the various items, and by many other things. In estimating the cost, the items include the personnel costs of the survey director, consultants which may be used, research analysts, interviewers, typists, etc.; travel and communication; machine tabulation; office

supplies, postage, etc.; and printing of the report. Sometimes it is possible to secure personnel for certain portions of the survey from other agencies without direct cost to the organization making the survey. Again certain services may be made available without charge, such as machine tabulation.

The quality of the survey is influenced greatly by the background, experience and abilities of the personnel that may be assigned or recruited for the survey. The director needs research planning ability, understanding of the field of technician education, and ability to organize and administer the project. The consultant needs familiarity with the broad task of surveys of technician occupations, with technician education program planning, with occupational analysis techniques, with research practices, with report preparation. The interviewers may well come from the field of industrial and technical education - as teachers or local supervisors - if the time schedule for the interviewing could be at periods when they might be available for such service. The contacts made with industrial personnel through the survey interviews often are useful later in their school work. Occupational analysts can sometimes be made available from the public employment service.

Surveys are often expedited by the setting up of a time schedule for all portions of the survey. Some of these activities may run concurrently; others are dependent on previous survey activities. A sample schedule taken from a recent survey shows the important items of the schedule:

| | MONTHS (January through May of second year) | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | J | F | M | A | M | J | J | A | S | O | N | D | J | F | M | A | M |
| Initial planning | x | | | | | | | | | | | | | | | | |
| Securing background data | x | x | | | | | | | | | | | | | | | |
| Preparing master file | | x | x | x | | | | | | | | | | | | | |
| Interviewing | | | | | x | x | | | | | | | | | | | |
| Coding | | | | | x | x | | | | | | | | | | | |
| Machine processing | | | | | | | x | x | | | | | | | | | |
| Analyzing data | | | | | | | | | x | x | x | | | | | | |
| Writing the report | | | | | | | | | | | | x | x | x | x | | |
| Editing, art work, printing | | | | | | | | | | | | | | | x | x | x | x |

The time required for the different parts of the survey is frequently underestimated. Especially is this true with respect to analysis of the data and the preparation of the report.

The total data utilized in the survey will include material previously gathered in other surveys (usually for different purposes), as well as the data obtained directly from employers. Much information is already available in most communities in the form of reports made by chambers of commerce, trade associations, public employment offices, and other organizations. This kind of data

is usually more general than that needed specifically for determining technician training needs, yet it is useful in providing an overall view of the area. Effort should be made to gather all such data as may be available from State and community sources.

Two methods are commonly used in gathering information from employers, the questionnaire and the personal interview. Of these, the interview method is currently used quite widely, and is the one recommended. In using the interview method, the personal contact tends to secure greater attention to the task of furnishing information on the part of the employer. It usually requires less work on the part of the employer than when the questionnaire is used. The interviewer is able to explain just what kind of information is needed; thus the data are more accurate. When the questionnaire is the method used the returns are frequently spotty. Employers are beseiged with such requests for information and often either throw the questionnaire away or answer it in a sketchy manner.

The personal interview method provides another desirable outcome, that of providing a personal contact which may be utilized later for other purposes in developing and carrying on the technical program.

In working out the specific methods to be used in the survey, it is highly desirable that previous experience in conducting surveys in the technician training field be studied. Reports are available on several technician surveys, such as those in Michigan, California, Kansas, and Connecticut. The procedures used in gathering the data in these surveys may need to be changed to meet local conditions, but they are suggestive and useful.

A major task is the devising of the survey instrument, the schedule used by the interviewer, or the questionnaire, if that is used. In preparing the schedule blank to be used by the interviewer, care needs to be taken to include only those items which are really pertinent. If data are gathered which are never used--and this frequently happens in surveys--time is wasted and costs rise. Thus it is essential that the data requested be limited strictly to those which will be utilized in planning the technician training.

The data needed for planning technician training programs include most of the following items:

1. Total number employed in the establishment

2. Numbers of technicians employed, broken down by occupational groups, and by sex. Occupational groupings might well be similar to the following:

| | |
|---|---|
| Mechanical design<br>Mechanical production<br>Electrical<br>Electronics<br>Chemical<br>Heavy construction, etc. | (Actual payroll jobs should be listed, with job titles, if practicable.) |

3. Estimated number of technicians to be needed two years hence and/or five years hence, by occupational groups

4. Technician jobs for which it is difficult to get workers

5. Sources from which present technicians are recruited

6. Plant training programs now being offered by the establishment

Other items may be needed, but the total number should be kept to essentials.

The interview schedule blank should be carefully prepared, with spaces of appropriate size and spacing, and with items listed in approximate order in which they will be obtained. If the data are to be tabulated by machine--and this is almost always the case--the items should be precoded, to save time in tabulation.

Clear and complete instructions will be needed to make sure that interviewers fill out the blanks accurately. These instructions may well be on a sheet attached to the schedule. A most essential element in these instructions is the defining of what is meant by technicians.

Before the interview schedule is printed in its final form, it is quite desirable that it be tried out with several employers to make sure that it is usable and that it provides the desired information. On the basis of this trial run it is revised to take care of needed changes.

The interviewers selected to gather the information will need a period of intensive training, to make sure that all interpret the procedures in the same manner. A manual for their use may be desirable, including clear-cut definition of technician occupations, specific instructions for using the interview schedule, getting to the proper person for the interview, the use of appointments or cold calls, the recording of the data secured, and safeguarding of confidential information.

Before the field work gets under way it may be desirable to send letters to the employers to be interviewed, giving them some background concerning the survey and requesting their cooperation. If these letters could be sent in the name of some well-recognized organization--such as the Chamber of Commerce or similar agency--they may well carry more weight than if sent by the survey director.

When the field work is started it is usually desirable for the interviewers to meet for a short period at the end of the day, for the first few days, to exchange experiences concerning difficulties encountered, and for a check-up as to whether they are getting the desired information.

As each interview schedule is turned in it should be proofed to check for omissions and errors. Then the coding may be started, to prepare the data for machine tabulation. Some of this may well be done while the interviewing is proceeding.

The working out of the tabulation forms on which the final data will be recorded is an important task. If the form shows the data by groupings which can be directly utilized in analysis for program planning, time may be saved. Care must be taken, also, to safeguard the confidential data by grouping them so that those for a single establishment are not revealed. Accuracy in tabulation is essential, and means should be devised for checking the work. Tabulating large amounts of data takes time, and one must guard against the tendency to underestimate the amount of time required.

The most important task of the survey is the interpreting of the data, and the drawing of conclusions concerning training programs needed. This requires a broad understanding of the whole field of technician training and of occupational needs and requirements. Tentative conclusions arrived at by the director and his staff may well be discussed fully with the working group of the advisory committee, and with others concerned with the operation of the program, before final conclusions and recommendations are formulated. In a State-wide survey such conclusions will involve not only the types of curriculums to be offered and numbers to be trained in each, but also the most desirable location of the various programs in the different schools in the State.

The preparation of the survey report involves procedures similar to those encountered in getting any bulletin ready for printing. Decision will need to be made concerning the use of tables, graphs and charts; organizing the material into appropriate sequence; possible use of color; the format of the printed report; preparation of the art work, and the like. It may be desirable to prepare two types of reports; a short summary report for general publicity purposes, and a longer report which will include all the pertinent findings.

Although the survey is made primarily for getting data on which to base program planning, the findings may be useful in other ways. Hence it may be desirable to publicize the results for the general public. The report will normally first be submitted to the advisory committee and to the board of the sponsoring agency. Later, if advisable, the data will be made available to the public.

Under some circumstances it may be practicable to have the occupational survey made by the public employment service, working in close cooperation with the educational authorities. This practice has some advantages over the plan of having the survey made by the educational staff. The public employment service has background of experience in securing information from employers, in the use of scientific sampling techniques, in the tabulation of data by machines. The State Employment Security Commission usually has trained research personnel and labor market analysts on its staff. A cooperative arrangement between the educational authorities and the public employment service thus makes available resources which can insure a valid survey. An example of such a plan is the recent State-wide survey of North Carolina industries by the North Carolina Employment Security Commission working in cooperation with the State Board of Education. The Commission plans to publish the findings in the summer of 1962.

# CHAPTER 6. USING SURVEY RESULTS FOR DETERMINING CURRICULUMS TO BE OFFERED

The data found through the occupational survey are essential as bases for program planning. But other factors need to be taken into account. The total replacement needs for technicians are met by various means, and only after a careful study of all sources of supply for technicians can a valid estimate be made of the number of graduates of the proposed program who may find jobs. Some of the replacement needs are met through upgrading of workers presently employed. Some are met through the hiring of graduates of technician training programs located at a considerable distance from the area under study. Some of the replacements are dropouts from engineering colleges, or are graduates of these colleges who enter technician jobs as transition employment prior to assuming work of engineering character. Sometimes the replacement needs are partially met by graduates of vocational-technical high school programs in the community. A study of all these sources of supply, including the probable number of potential technicians available from each source, should provide an estimate of the competition for the technician openings which the proposed training program will face. These facts must be taken into account if a realistic estimate is to be made of the number of potential placements of graduates of the new program.

In a field such as technician training, estimates of replacements only is not sufficient to give a picture of total needs. The technician field is growing rapidly, and the data obtained from the survey which estimate the expected growth in the number of technicians are highly important. Thus the total needs for new technician personnel will include those required for expansion in addition to the replacements.

Curriculums for the training of technicians are usually aimed at groups or clusters of closely related technician occupations rather than at a single technician payroll job. Thus in determining the curriculums which may be needed and the numbers to be trained in each, attention must first be given to the development of the occupational clusters. These are groupings of payroll jobs which are closely related to each other through such items as:

1) The similarity of work performed

2) The abilities and knowledges required of the worker

3) The patterns of worker characteristics required by the job

4) The instruments, machines, tools or other equipment used

Although the specific jobs which make up the cluster differ from each other in certain respects, the similarity is sufficiently prominent to warrant the setting up of a training program which will provide the abilities needed for effective discharge of the job functions.

The jobs which make up the cluster may well be required to meet the following criteria: (*)

1) There are a sufficient number of jobs in the cluster to provide a reasonable spread of job opportunities for the person graduated from the curriculum.

2) Each job in the cluster is of technician character.

3) The jobs are of the level that normally require post-high school maturity with one to two years of training.

4) The jobs are closely associated with each other in industry so that shifting of the worker from one job to another in the cluster is readily possible, and one job leads naturally to other more advanced jobs.

5) Important elements are found which are common to all the jobs, or in preparation needed for them, such as common basic science and mathematics, common industrial terminology, similar technical skills.

The development of the job clusters grows out of data obtained in the occupational survey. The specific technician jobs which show substantial needs for new workers are identified. Then each of these jobs is analyzed and brief job descriptions are prepared covering the work activities, functions, and performance requirements for each occupation. A useful procedure in grouping the jobs into clusters is to use a check chart on which the essential characteristics of the jobs are listed across the top of the chart, and the job titles are listed down the side. Each job is checked against the list of characteristics and a check mark made in the appropriate space if the job includes that specific characteristic. A "key job" is chosen which has all the characteristics. Those jobs for which a substantial number of check marks are found are accepted as belonging in a cluster with the key job. Detailed description of this technique is found in U. S. Office of Education bulletins OE-80000 - "Mechanical Drafting and Design Technology," and OE - 80004 - "Electrical and Electronic Technology."

After the job clusters have been worked out, the occupational survey data on replacement and expansion needs for each of the jobs in the cluster are combined. For these data, decision is made with respect to whether or not the numbers needed warrant a curriculum in that field. In making this determination several factors need to be taken into account. If the curriculum is to be added to an institution which already has other curriculums for which some of the basic courses are like those needed for the new curriculum, the number of students required may well be less than if such other curriculums do not exist. If laboratory facilities which demand expensive equipment can be utilized for more than one curriculum, this may influence the decision on curriculums to be offered. If the industrial need for technicians is very

---

(*) Adapted from Bulletin No. 1332, University of the State of New York, "A Guide to the Development of Programs for the Institutes of Applied Arts and Sciences," Albany, 1947.

critical, the decision to offer the training may be made on the basis of relatively smaller numbers. Sometimes the demand for extension courses for employed workers may be great, and this will influence the setting up of a day program using the same equipment for both purposes.

The numbers of graduates from a curriculum who may expect to find opportunity for employment will depend upon the replacement needs of existing workers, the numbers needed on account of growth and expansion in the field, and the numbers of new workers who may come from other sources.

The annual replacement rate for workers due to death and retirement varies considerably, depending on the average age of the employed workers and the nature of the work. A rough overall percentage which has been used in many surveys is five per cent. A more accurate estimate can be made by using the procedure on labor market research methods developed by the Bureau of Employment Security, U. S. Department of Labor. Details concerning this procedure can be obtained from State Employment Security offices.

The needs for new workers due to growth and expansion will have to be determined by estimates secured during the occupational survey. The numbers of new workers who will be recruited from other sources than the proposed program will need to be estimated. These will come from other institutions located at a distance which have contacts with the local industries, from upgrading programs and special technician training programs offered within the industrial plants, and from other sources. In the planning of the New York State Institutes of Applied Arts and Sciences it was estimated that 25 per cent of the technician openings in the State would be filled from other sources and that ultimately 75 per cent of the openings would be filled by graduates of the Institutes.

The contribution of the school in meeting the employment needs for new workers is measured by the number of students it carries through to successful completion of the various curriculums. In two-year programs of technician training on the post-high school level, the experience of many institutions shows a retention rate in the second year of approximately 60 per cent. Thus if twenty students are enrolled in the work of the first year it may be expected that twelve will return for the second year. The total enrollment in such a program would be thirty-two students. If the school sets a goal of a specified number of graduates from a given curriculum, the total number of students required in that curriculum can thus be estimated.

# CHAPTER 7. STUDYING THE AVAILABILITY OF STUDENTS

Post-high school technician training programs are selective with respect to admission. Candidates for admission must have completed high school or equivalent instruction. They must have intellectual ability represented by test scores of 100 IQ or above. They should have completed specified high school courses in mathematics and science. They should have interest in and adaptability for the various aspects of technical work.

The enrollment of qualified students in such programs is influenced by these factors:

The location of the school in relation to the student's home.

The transportation facilities available (including highways and school parking facilities.)

The type of neighborhood in which the school is located.

The extent and quality of equipment the student sees when he visits the school.

The placement opportunities when he finishes the program.

The prestige of the institution in the community.

The tuition fees, if any.

The extent to which he is acquainted with technician occupations, and with the program offered by the school.

These factors must be considered when plans are being made for offering technician training.

A curriculum should be offered only when an adequate number of students is assured. It is essential that study be made of the numbers of potential students for the proposed curriculums. Experience has shown that in areas of reasonable population density and good transportation facilities post-high school institutions of the technical institute type might expect to enroll 20 per cent of the high school graduates who are not going to college or professional schools. A rough estimate of the student potential can thus be made by obtaining data on the numbers of high school graduates in the area served by the school and the numbers who go on to college or professional schools. Such information can usually be obtained from the high schools. Primarily the students in the technician programs will be young men; but it must be kept in mind that young women are found in increasing numbers in technician occupations, and their attendance at technician training schools may well be encouraged.

Valuable data may also be obtained concerning the post-high school plans of high school students through appropriate surveys, usually by questionnaire.

It should be pointed out, however, that many high school students set their post-high school aims higher than actually materialize. In making such a survey of students who might be interested in technician training it is essential that they clearly understand the nature of the work of the technician, and the kind of institution in which the training is offered. They need also to be fully informed on job placement potentialities, and the growing importance of the technician in American industry.

In making surveys of high school students it is usually possible to get good cooperation from principals and counselors. Teachers may also assist in getting the questionnaires filled out. In this connection it is essential that those cooperating in the project be fully acquainted with the nature of the technician occupations, the opportunities for advancement which are found in these occupations, the compensation received by technicians, and the general working conditions. Careful explanation of these items is essential before the questionnaires are filled out, and questions may be asked by students which the person administering the completion of the questionnaires should be qualified to answer. These persons need to be thoroughly familiar with the nature of the proposed technician training programs, the rigorous character of the curriculum, the qualifications for admission, and other pertinent data concerning the program. A by-product from such surveys of high school students is the acquainting of the principal and counselors with the nature of the proposed programs which will be useful to them as they counsel students who may later be interested in technician work. The value of the returns from such a survey of high school students is often conditioned by the thoroughness with which the participating high school personnel are made aware of the character and potentialities of the proposed program.

It may be possible to secure from some high schools information concerning what former graduates are now doing, including the numbers who have enrolled in non-college educational programs subsequent to high school graduation, as well as data on those who have attended college.

Although it is difficult to predict with accuracy the initial enrollment in proposed curriculums of technician character, it should be possible to get a fairly good idea as to whether there are sufficient numbers of potential students in the geographical area to be served to warrant the establishment of the program. It must be kept in mind that after an institution has been in operation for some time, and when the standards and practices become generally known and graduates go out into good jobs, potential students learn about the school and enrollment tends to increase. The experience of many well established post-high school technician training institutions indicates that more students apply for admission than can be admitted.

## CHAPTER 8. ANALYZING THE OCCUPATIONS FOR TRAINING CONTENT

The determination of curriculum content requires more detailed information on technician occupations than is usually obtained in surveys of needs. Most surveys of this type include only brief descriptions of the various payroll jobs of technician type. Such descriptions include some data useful for developing the training content, but usually are incomplete from this standpoint. Thus it is necessary to study these occupations intensively, looking at them from the standpoint of the training needed to prepare persons for effective entrance into them. This study can be made in several different ways.

The information on training content needed may be gathered at the same time when data are collected concerning numbers and types of technicians needed. This involves considerable expansion of the interview instrument, greater versatility on the part of the interviewer, and a considerable lengthening of the time required for the interview. Also, the person in the industrial establishment who may be in the best position to provide data on needs for technicians may not be the best person to supply detailed information as to just what the technician needs in the way of training. The needs survey naturally includes many duplicate jobs, and detailed analysis of all the jobs may be unnecessary and wasteful.

A different procedure in securing the training content is to delay the gathering of such data until the needs survey has been completed, and then to concentrate on the analysis of the jobs for the determination of training content. This calls for a clear defining of the nature of the educational objectives sought (knowledge, understanding, technical skills, etc.), concentrated attention to the task of ferreting out the needed data, sifting out that which is most needed, and later organizing the data into appropriate courses and curriculums. It involves the selection of a small group of persons who thoroughly know the jobs in a selected cluster of technician occupations, and having these persons work intensively under the direction of a skilled technical education analyst. Qualified persons for this task are usually employed full-time in industry, but might be recruited for service on this task during evening hours. They will usually need to be paid for such service, since continued application over many hours will be needed. The types of persons needed for such analysis are highly skilled technicians currently employed on key jobs in the selected cluster of occupations, and/or the first line supervisors of technicians who thoroughly know all the aspects of the technician jobs. The analyst should be one who knows enough about the technology of the jobs to work intelligently, and who is thoroughly familiar with analysis techniques as used in preparing course outlines. A good procedure is to operate on the conference basis, with the analyst drawing out the needed data through discussion, and directing the individual efforts of the group members in writing down the information. A small group - such as an analyst and three or four technicians or technician supervisors - seems to work better than a large group. The persons should be selected from different companies so that varied practices in these organizations will be brought out. Sometimes such a working group also can be utilized effectively in developing the instructional materials needed, or at least in doing the preliminary planning for such materials.

In starting the analysis of the occupations for the training content needed, a first step is to recognize clearly the various kinds of content that will be needed, and the kinds of abilities that will be required as the student progresses in the training program. Among these are technical knowledge and understanding, manipulative and technical skills, understanding of pertinent mathematics and science and the ability to apply them to technical situations, communication skills using verbal and other symbols, and human relations understanding.

In making the analysis each of the occupations in the cluster is broken down into the specific work tasks performed, and notation made concerning the relative frequency with which each task is performed. Each work task is then analyzed to get at the specific technical knowledge needed to perform it, the applied science and applied mathematics required, the understanding of drawings required, and other pertinent items. Care is needed to make sure that the analysis is in specific terms, such as specific applications of mathematics or of physics. For example, in a certain task performed by a tool inspector in determining the angle a tapered hole makes with the base he must be able to visualize a right triangle in the inspection set-up and to utilize trigonometry in the solution of the problem. In this case, however, the ability to use trigonometry which is actually required is limited to using the sine of an angle in a right-angled triangle and a table of sine values for different angles. The tendency in making an analysis of this type is to state that "trigonometry" is needed, rather than the specific aspect of trigonometry that is really required.

The tasks being analyzed need to be looked at from all the different educational content items - technology, mathematics, science, and others. After a number of the tasks have been analyzed to determine the range and types of content needed, it may be advisable to set up a check-chart which lists in one direction the various tasks in the occupation being studied, and in the other direction the various specific items of technology, mathematics, etc., which the analyses reveal. The presence of a specific item is checked in the appropriate space. Such a check-chart helps the analyst to remember the different items which require checking. After the specific tasks have been analyzed they may be combined in a check-chart which lists occupations (instead of tasks) against the training content items. An example of such a chart is shown in Office of Education bulletin OE-80004 - "Electrical and Electronic Technology."

When the analysis of the various occupations in the cluster has been completed, the content items found are classified into appropriate groupings, where they may be studied as separate groups. Those items dealing with a recognized phase of the technology would be placed together; those dealing with mathematics in another group, and so on. These groups of items will later be studied as the bases for development of courses. When one examines the items of a specific group he may discover that additional items may be needed which were overlooked in the analysis. Or close examination may reveal the need for items which would not appear in the analyses but which will be needed in order to teach the other items effectively. An example might be certain basic science principles on which those listed might depend. Much careful thought needs to be given to a study of the

various groups of items to make sure that essential ones have not been omitted, and to eliminate those which close scrutiny reveals as superfluous.

If the analysis of technician jobs for training content is done at the time the data are gathered concerning needs for technicians, the survey schedule blank will need to be considerably longer than if only the data on needs are gathered. Since there will be little opportunity during the interviews for detailed discussion of content items, the tendency is toward gathering data which are less accurate than those obtained through exhaustive analysis of the occupations by persons whose daily work is directly with these occupations. But considerable information can be secured in the needs survey. A sample schedule which includes space for such data is shown in Brandon's study - "Twin City Technicians," listed in the Bibliography. The data thus secured are studied by a competent analyst, sometimes supplemented by additional information from persons technically competent in the occupational field. The check-chart technique described above is also applicable here.

Detailed analysis of work tasks as well as broader analysis of the occupation is especially desirable in occupational fields in which there is little previous experience to use as guide lines. In fields where training programs have been operating for some time, much valuable help can be obtained from studying what has already been done. In such cases the analyses need cover only those aspects which are new as compared with those dealt with in the existing programs, and the time required to gather the data needed is much less than when one is starting from scratch in a new field.

The content data gathered as outlined above, and classified into appropriate groups, form the bases for the development of curriculums, outlined in the following chapter.

# CHAPTER 9. DEVELOPING THE CURRICULUMS

A curriculum may be defined as an integrated group of courses of study of appropriate types and lengths, arranged in proper sequence, and leading to a defined educational objective. The objective of the curriculums of the technician program is preparation for effective entrance into beginning or entry jobs in specific clusters of occupations of technician type. A definite curriculum is provided for each cluster, and is a distinct entity, although some of the basic courses of a curriculum may also find an appropriate place in one or more other curriculums. The program of the institution as a whole is thus the composite of all the curriculums offered.

The task of developing a curriculum from content obtained from the occupational survey is that of arranging the content into appropriate courses of suitable length, and arranging these courses in proper sequence. The technical content found in the occupational survey is supplemented by other content of general educational nature, or by foundation courses required if the student is to be enabled to master the technology. Thus the development of a curriculum involves understanding of the educational philosophy pertinent to the selection of the general education content, of the principles involved in arranging courses in pedagogical sequence, of appropriate teaching methods for specific courses, as well as ability to synthesize the material found in the occupational analysis.

In planning curriculums for two-year post-high school technical programs it is desirable that the following principles underlying technical curriculums be kept in mind:

## Principles Underlying Technical Curriculums (*)

1. The curriculum title describes it so clearly that it is easily identified and understood by employers and prospective students.

2. The range of content needed in preparation for the jobs in the cluster is reasonable for a two-year post-high school program.

3. The technical content leads itself to organized school instruction.

4. A substantial portion of the total curriculum content consists of technical courses peculiar to the job cluster or basic thereto.

---

(*) Adapted from Bulletin No. 1332, University of the State of New York, A Guide to the Development of Programs for the Institutes of Applied Arts and Sciences, Albany, 1947

5. The difficulty level of the content is such that it can be mastered by a reasonably high proportion of the students within the time limits of the curriculum.

6. It will be feasible to secure, maintain and keep up to date the special equipment needed for the curriculum.

7. The curriculum is built upon established entrance requirements for students, which may specify the completion of specified courses as well as high school completion.

Curriculums may be developed in several different ways. Among these are the following:

1. "Lifting" the curriculum from some other institution. Generally this is not a desirable practice. The curriculum may not be a good one, even in its present setting. The institution in which it is found may be different from yours in objectives, standards, and the like. The entrance requirements may be different from those you propose. The curriculum may not fit the needs of your placement market.

2. The "scissors and paste pot" method. This consists of using parts of several different curriculums from other institutions. This method has many of the hazards outlined under (1) above.

3. Opinion analysis. In this method the curriculum is developed from the ideas suggested by persons acquainted with the field and with educational procedures. It is valuable in proportion to the expertness of the persons whose opinions are utilized.

4. Occupational analysis. This approach is necessary in fields where curriculums have not previously been developed, or where it is desirable that the curriculum meet the specific needs of the community it serves. It is usually desirable to utilize the findings of an occupational survey as a check against a curriculum developed by other means.

5. Combinations of above methods. This is the procedure which is most commonly used. Perhaps the most effective procedure is to make an occupational survey, and to develop the curriculum from the data thus obtained, checking the pattern of the curriculum and certain of the details against good similar curriculums in other institutions, and utilizing the opinions of qualified persons in the curriculum building field.

Procedures in developing a curriculum by occupational analysis.

Since this procedure is necessary in developing curriculums in new fields of technician occupations, it is outlined here in some detail:

125

1. Set up the objectives of the curriculum in terms of desired occupational and educational goals. This will include the scope and level of occupational understandings and skills desired, and the scope and level of general education attainment to be sought.

2. Select the specific occupations to be included in the job cluster.

3. Analyze the occupations in the job cluster for training content. This analysis should include:

   Technical knowledge and understanding, and technical skills needed.
   Basic and applied mathematics needed.
   Basic and applied science needed.
   Basic and applied drawing needed.
   Manipulative skills required.
   Communication skills and management understanding needed.

The use of a check-chart such as that described in Bulletin No. 80004, U.S. Office of Education, Electrical and Electronic Technology, is useful in determining the specific items of content needed for the various occupations of the cluster.

4. Set up the necessary specific entrance requirements for students. The analysis of content made under (3) above will indicate the intellectual ability level needed, the desirable high school courses in mathematics and science which the student should have completed, and any previous work experience which should be required of entrants to the program. The entrance requirements with respect to ability are frequently set up in terms of minimum scores on a battery of carefully chosen standard tests.

5. List the content items from (3) above which the student:

   (a) Should have when he enters.

   (b) Can learn more appropriately after he enters employment.

The content from the curriculum is the total content needed minus (a) and (b).

6. List the controls which affect the curriculum. (Some of these are inherent in the program of the institution where the curriculum is to operate.)

   (a) Total permissible length of the program.

   (b) Division of the program by terms or semesters.

   (c) Nature of the curriculum pattern, if cooperative.

(d) Fixed or mandated subjects required of all students.

(e) General education mandates, in total hours.

(f) Practice of the institution concerning electives.

(g) Entrance requirements for all students in the institution.

(h) Type of schedule of the institution--periods per day and week, length of periods, length of school year.

(i) Diploma, certificate, or associate degree requirements.

(j) Potentialities for securing needed space and equipment.

Many of the above items are pertinent only if the proposed curriculum is to be added to the program of an existing institution. If so, it is essential that they be considered.

7. Group the selected curriculum content into major component areas:

| | |
|---|---|
| Technology of the major field | Basic and applied drawing |
| Technology of related fields | Management content |
| Basic and applied mathematics | General education content |
| Basic and applied science | |

Since the primary objective of the program is the development of technological understandings and skills, a substantial proportion of the total content of the curriculum is made up of the technology of the occupational cluster. This proportion varies somewhat in different institutions, with some curriculums providing as much as 80 per cent. In well-rounded programs the proportion of technological content often runs from 50 per cent to 60 per cent, supplemented by basic and related science, mathematics, and drawing to the extent of 20 to 30 per cent.

The general education content to be included in the curriculum does not come directly out of the occupational analyses. This is usually determined by the broad objectives of the program, the degree to which the curriculum is aimed specifically at the technological needs, the philosophy of the institution in which the curriculum is to be offered. The amount of general education included will vary with the total length of the curriculum in semester hours, and the time required to take care of all the technological needs. Breadth is desirable in the curriculum, but not at undue expense of the technological needs.

8. Set up tentative course titles designed to cover the content of each major component area.

The course titles will include those courses in mathematics, science, etc., which may be needed as basic foundations even though they do not emerge directly from the occupational analysis.

9. Allocate the selected curriculum content under the appropriate course title.

In this connection one must keep in mind the difficulty levels of the content and the prerequisites for certain courses.

10. Decide on the type of instruction needed for each course.

Courses will be taught through classroom work, laboratory work, shop work, drafting room, and field work. Some groups of content will require both classroom and laboratory work. The content to be included in each type of course should be segregated, and plans made for correlation when the schedule of classes is developed.

11. Determine the tentative length for each course, in terms of total contact hours, outside study required, and total credit hours.

This will require the development of a topical outline or syllabus for each course, with approximate time elements for each component of the course. It will be necessary to check the total contact hours and credit hours for the proposed courses in the curriculum against the permissible length of the curriculum as a whole. Course length and credits may then have to be revised to fit the total length of the curriculum, which may require deletion of some less important items.

12. Arrange the courses in appropriate instructional order.

In this task one must keep in mind the relative difficulty of courses, and prerequisite courses needed for proper understanding of advanced courses. Thus in a curriculum in electronics technology one finds courses in algebra and trigonometry preceding a course in applied analytic geometry, and a course in direct current circuits preceding that in alternating current circuits.

13. Allocate the courses into semesters or terms with approximately equal work loads.

The credit-hour is a good measure of workload, and all semesters of the total curriculum should have approximately the same number of credit hours.

14. Work out a tentative time schedule for the curriculum.

This is desirable in order to make sure that all the courses in a given semester may be scheduled to fit the schedule pattern of the school, the availability of laboratory space at the time desired, and a proper daily and weekly balance between classroom and laboratory or shop work.

15. Revise the courses, sequences, schedule, etc., as may be found necessary.

It should be understood that the various items outlined above as steps in curriculum development are listed in approximately the order in which they may well be carried out, but that one must work back and forth with respect to certain items. Thus tentative course titles and tentative course content may need to be revised in the light of needed changes to make the curriculum conform to an appropriate over-all pattern.

General education in the technician training curriculum.

The term "general education," as used here, includes the knowledge and skills which all persons need who work at the level of technician occupations, irrespective of the specific occupational fields in which these persons are employed. Some of these competencies are of direct use on the job, such as the ability to communicate effectively orally and in writing. Others are designed for broadening the individual to make him a more effective member of a democratic society.

Curriculums for technician training often include courses in various phases of the social studies, and include economics (basic and applied), human relations, and various other subjects. The extent of the general education in the curriculum is usually determined by the basic philosophy of the institution in which it is offered. The tendency in institutions which also have college preparatory curriculums is toward a larger proportion of general education in the technician curriculum than is usually found in such curriculums in institutions which limit their offerings solely to occupational training programs. The range of general education content varies from zero to more than 30 percent. Curriculums with liberal proportions of general education are richer in their over-all aspects. If this can be done without sacrifice of important technological content, such programs are desirable. But care must be taken to achieve a proper balance, since the main objective of the technician training curriculum is the preparation for effective work life in which technology is of great importance.

Management courses in technician training curriculums.

When the technician training curriculum is in the field of production, and the worker is closely tied in with production processes, it is usually desirable to include pertinent courses in the field of management. The occupational analyses will often give clues to the need for such content. Among these offerings are such course titles as industrial relations, supervision, production management, industrial economics, and production control.

Options in curriculums.

Sometimes the total program includes two curriculums which are closely related with respect to the basic technology, mathematics and science needed, but which differ from each other in the advanced applied technology. For example, a curriculum in mechanical production technology has similar basic content to one in mechanical design technology. In such a case it may be desirable to have a single curriculum which has a common first-year program for all students but provides options (production or design) which the student may choose for his second year's work. Similarly curriculums in electrical

technology and electronics technology may have some 50 per cent of the total content common to both, as illustrated by those outlined in Office of Education publications OE-80006 and OE-80009, listed in the Bibliography. (See Fig. 7)

Some problems encountered in curriculum planning.

In some cases where curriculums are being planned for technician training, there may be a tendency to follow curriculum construction practices which are pertinent in other educational fields but which do not apply to technician training. The background of experience of the curriculum planner, and the course facilities already available in the institution, may tend to make the curriculum planning veer from the most desirable course. Among the problems encountered are the following:

1. Attempts to provide "dual-purpose" curriculums.

   It is sometimes proposed that a curriculum prepare persons either for entrance into a technician occupation or to advanced standing at an engineering college. The appropriate content for these purposes differs considerably, and such a "dual-purpose" curriculum usually attains neither objective. In the case of programs operating under Title VIII of the National Defense Education Act the requirement of "less than college grade" means that the curriculum is specifically designed to prepare persons for entrance directly into the technician field, that the program content does not parallel that found in the first two years of engineering college baccalaureate degree curriculums, and that the curriculum is not designated by the institution for credit toward such a degree. The phrase "less than college grade" refers to the terminal character of the program, and not to the quality of the program. Good technician training curriculums demand intensive effort on the part of carefully selected students of ability.

2. Setting up a "general engineering" curriculum for preparing technicians.

   Technician training is highly specialized training for effective entrance into specialized clusters of closely related occupations. A general curriculum aimed to prepare for a great range of occupations does not permit the specialized instruction for the technician field.

3. The tendency to use existing courses in an institution even though they do not fit the curriculum effectively.

   This is especially true with respect to mathematics, science and drawing. Generalized courses in these fields are usually taught by persons who have little acquaintance with technician occupations, and the content of the courses may contain specific items which are of little use to the technician. Really effective courses need to be designed for specific goals.

| COURSES SPECIAL TO THE ELECTRICAL CURRICULUM | COURSES COMMON TO BOTH CURRICULUMS | COURSES SPECIAL TO THE ELECTRONICS CURRICULUM |
|---|---|---|
| TECHNOLOGY<br>Electrical Instruments and measurements<br>Alternating current machines<br>Electrical installation planning<br>*Industrial electronics<br>Electrical control circuits<br>Electrical power systems--in-plant distribution (with utility systems option)<br>Operating problem analysis<br><br>SCIENCE<br>Chemistry and applications in electricity<br><br>*A less intensive course than that in the electronics curriculum. | TECHNOLOGY<br>Direct current circuits and machines<br>Time varying circuits<br>Basic electronics<br>Shop processes<br><br>MATHEMATICS<br>Algebra and trigonometry<br>Applied analytical geometry and calculus<br><br>SCIENCE<br>Engineering science (physics)<br><br>DRAWING<br>Technical drawing<br>Graphic analysis<br><br>GENERAL EDUCATION<br>Social science<br>Communication skills<br>Technical report writing | TECHNOLOGY<br>Circuit tracing<br>Special electronic circuit design and analysis<br>Transmitter theory and operation<br>Research report (special problem)<br>Ultra-high frequencies and microwaves<br>Television circuits<br>Industrial electronics |

The courses offered in the first year are the same in both curriculums.

Compiled from data in U.S. Office of Education bulletins OE-80006 (Electrical Technology) and OE-80009 (Electronic Technology).

FIG. 7 -- COMMON CONTENT IN ELECTRICAL AND ELECTRONIC CURRICULUMS

4. <u>The tendency to pattern the technician training curriculum after the curriculum designed for skilled trades training.</u>

The objectives of the two fields are essentially different, in that technician training is focused on the development of technical understanding and technical skill, whereas skilled trades training is focused on the development of craft skills, largely manipulative in nature, and on the understanding of specifically related subject matter. (The curriculum pattern in skilled crafts training has its center in the work of the shop, and the technology is related to the shop work.) In technician training the focus is on the technical principles and processes, developed through classroom study and laboratory experimentation, and any shop work in the curriculum is largely a related aspect of the technology. (See Fig. 8)

5. <u>The problem of standards - of levels of instructional content and of student attainment.</u>

This problem arises when a person whose background has been largely in skilled crafts training is preparing the technician training curriculum. He needs to recognize that technician occupations require training which involves considerably more advanced mathematics, science and technology, with greater and more frequent application than that required for the crafts. Students in skilled crafts programs usually have much less in the way of rigorous study, including study outside the classroom and shop, than is required of students in technician training programs. The schedule pattern also differs markedly, the admission requirements for students in technician training are higher, and the objective is preparation for a cluster of occupations rather than for a single skilled craft. The total approach to the problem is thus quite different in the two fields of training.

FIG. 8 — COMPARISON OF TRAINING PROGRAMS FOR THE SKILLED CRAFTS AND TECHNICIAN OCCUPATIONS

# CHAPTER 10. DEVELOPING THE COURSES OF STUDY

In the previous chapter on curriculum development several steps were outlined which dealt with courses of study. The purpose of the present chapter is to present some details describing types of courses found in technician training curriculums and how these courses are developed.

A curriculum was defined as an integrated group of courses of study of appropriate types and lengths, arranged in proper sequence, and leading to a defined educational objective. Similarly, a course of study may be defined as an integrated group of instructional units, arranged in proper sequence, and leading to a defined objective. In structure, the curriculum and the course are similar. In content, the curriculum deals with major components; the course of study, with specific instructional units. These units, in turn, are made up of specific items of instruction, which are the basis for the lesson plans developed by the instructor for each session.

Each course of study is intimately related to the method used for teaching the course, and each course of study is developed in accordance with the procedures utilized in the method of teaching which is to be used. Thus the course of study for laboratory teaching differs from that which would be appropriate for the classroom.

In the field of technician training the courses are taught in laboratories, shops, classrooms, and drafting rooms.

Laboratory courses are designed to develop technical understandings and technical skills. They take the form of a series of planned exercises or experiments using technical equipment. Frequently the procedure requires the student to perform experiments which help him to understand scientific formulas by actually following the steps by which the formulas were derived. Sometimes the laboratory instruction aims at the development of technical skills, such as the ability to diagnose trouble in electronic circuits, or to use effectively various kinds of test instruments. Or it may be aimed at developing understanding of the construction and operating principles of machines, instruments, or other equipment. Usually the laboratory work involves the preparation of technical reports, thus developing skill in organizing the writing the report. Laboratory instruction is largely individual, with the instructor giving assistance to the individual student as needed, and checking his work.

Shop courses found in technician training programs have as their objective the development of those manipulative skills needed by the technician, since an integral part of the tasks performed by some types of technicians require such skills. A technician employed in an experimental laboratory, for example, may need certain skills in order to build or alter equipment used for experimental purposes. Skill in the use of certain hand tools is needed more frequently than is skill in the use of machine tools. The scope of such shop training is usually much narrower than that found in shop courses designed for the training of the skilled mechanic. It must be kept in mind,

however, that a properly equipped machine shop may also serve as a laboratory, and be used to provide the technical understanding of machine tool processes and capabilities rather than for the development of trade skills.

Classroom instruction in technician training curriculums takes several different forms. Sometimes the instruction may be largely of the lecture type, although this type finds relatively little place in these curriculums. Classroom presentation followed by discussion is widely used. The presentation is often accompanied by demonstration of technical principles, or by the use of varied forms of audio-visual aids, sometimes including closed-circuit television. Or the classroom work may take the form of the conference method, mixed in with presentation and discussion. In such situations the use of case studies or role playing as a basis for the conference is sometimes found. Thus the pattern of the course of study for the different forms of classroom instruction may need to be varied to suit these different methods.

All courses which make up the curriculum should meet the following basic criteria:

1. The objectives of the course are clearly outlined and clearly understood.

   The range and level of attainment expected of the student when he completes the course, in term of knowledge, understanding, technical skills, manipulative skills, attitudes and appreciations, should be clearly defined and be kept in mind as the course is being developed.

2. The content of the course is of appropriate level.

   Consideration should be given to the ability level of the student and the position of the course - early or later - in the curriculum.

3. The content is based upon what the student has learned in previous courses or previous instructional units of the present course.

   Some repetition for review purposes may be desirable, but this should be done intentionally.

4. The content is in appropriate instructional order.

   The instructional units are arranged in order of progressive difficulty, or in some other logical sequence. One unit leads naturally to the next one.

5. Each instructional unit is of satisfactory size for effective learning.

   For certain types of courses the size of the instructional unit is governed by what can be taught and learned in a given class

session. In all cases the unit should be a self-contained, well-organized body of content, yet small enough to be handled effectively in the teaching-learning situation. The student progresses from one level of difficulty to the next level by successive steps, and these steps should be small enough to permit steady progress.

6. <u>The length of the course is in keeping with the time available for the whole curriculum, and with the scheduling pattern.</u>

   Each course should be allotted its proportion of time available for the whole curriculum in accordance with its importance and the extent of essential content. The time allotted to the course in hours per week and per term should fit in with the time allotments for other courses so that a workable schedule can be made, for space and equipment usage as well as for permitting a desirable schedule from the standpoint of student learning.

The type of instructional units which make up the course of study, and size of these units with respect to time required, are closely influenced by the method of instruction used. For courses taught in the classroom it is usually desirable to divide the total content into units which may be taught in single class sessions. This makes for more effective teaching, for each unit may be started and finished in the one session, a procedure which is desirable in group instruction.

When the instruction is largely individual in nature, as in the case of laboratory work, shop work, and drafting instruction, where the student progresses at his own speed, the size of the instructional unit may be larger than what can be accomplished in one session. In cases, however, where it is necessary that equipment be dismatled at the end of the period so that the laboratory can be used by successive groups of students, the limiting of the size of the instructional unit to what can be done in a single laboratory session is desirable.

In sessions in which the conference method is used, utilizing the various conference procedures including the case method and role playing, the size of the instructional unit preferably should fit the length of the individual conference session.

As indicated earlier, the course of study is an organized group of instructional units, each with its specific objectives. Thus in planning the course as a whole the objectives and content of the various units must be carefully studied so that the units can be arranged into an integrated whole.

Several different ways of building courses are utilized. In all of them the first step is to gather the data which make up the content of the course. Then the data are organized into the appropriate instructional units. The data may be gathered from many sources. The best source of technological data lies in the occupations for which the course in planned to provide trained workers. The procedure for extracting such data is careful analysis of the knowledge and skills required by the worker. This is not a

short nor easy task. It requires sustained effort in working with persons who are thoroughly familiar with the detailed tasks performed by the workers. An effective procedure is to have a trained educational analyst work with a small group of competent workers in the technician occupations under study.

An example of this procedure is the development of courses of study in the field of inspection of machined parts, tools, and gages. Four competent inspectors were brought together, each one qualified in the broad field of inspection but specialized in some aspect of the work. These men gathered around a conference table under the leadership of the analyst, and worked for many evenings on the task of pulling out all the pertinent knowledge, skills, attitudes, etc., needed by workers in the different inspection tasks of this occupational field. The inspectors were paid for their work, on a basis similar to that for instructors of evening classes.

In carrying out the analysis the inspectors were given stacks of slips of paper, 3" x 5", and were asked to write on a single slip of paper each inspection task which had come to their attention during the preceding days. Such an entry might be "measuring an angle of a part using the sine bar and gage blocks." Each inspector made out a considerable number of these entries, each on a separate slip of paper. When it appeared that they had covered most of the tasks usually found, all the slips were piled together to be sorted later. Next, each inspector was asked to make a similar listing of all the instruments and accessories he had used or seen used in these tasks. The listing of the instruments recalled some inspection tasks which they had not previously listed. Catalogs of inspection instrument manufacturers were available to help the inspectors in recalling the various tasks. When the lists were reasonably complete they were sorted for duplications, and the entries were then classified into groups from which the courses were developed.

The foregoing example is an illustration of the "introspection" process in which a person competent in the occupation thinks back through his experience and recalls the tasks performed. The recall is stimulated by the presence of other inspectors, and the interplay between them, as well as by the techniques used by the analyst to help them in this process.

After the tasks of the occupation have been listed they are laid out in learning sequence, taking into account such items as the following:

1. The simplicity or difficulty of the operations which make up the task.
2. The number of different operations required in the task.
3. The accuracy required.
4. The judgment required.
5. The range and depth of technical knowledge required.
6. The degree of technical skills needed for the task.
7. The number of different instruments or tools used.

8. The number of different things the student must keep in mind at one time.

9. The cost of errors, such as damage to equipment or materials.

10. The dependence of one task upon learning acquired in previous tasks.

The task of building courses of study in mathematics and science differs somewhat from that of developing the technical courses. The content of applied mathematics and applied science is derived from analysis of the mathematical and scientific applications found in the tasks performed by technicians in the occupations under study. When making such analyses care must be taken to include the specific aspects of mathematics and science really needed, rather than to specify broad mathematical and science areas. For example, on the surface it may appear that a certain type of inspector needs trigonometry, and the inference is that he needs a rather complete course in this subject. Closer scrutiny, however, reveals that the only trigonometry he really needs is that required to solve problems invloving the sine, cosine and tangent of the right angle triangle. He also needs the ability to visualize a right triangle in his inspection setup, and this involves different kinds of learning from that of simply manipulating the trigonometric functions.

In the fields of mathematics and science it may be necessary to include in the curriculum certain courses which are basic ones and which are needed as foundations for the applied mathematics and science. The content for such courses is derived from the field of pure mathematics and science, and the course content usually is taken from existing programs and from testbooks in these fields. Each course, however, needs to be set up in terms of the learning ability of the students and their previous achievements in that field.

No matter what the nature of the content of the course is like, the typical procedure in course development is analysis of the pertinent items, selection of those items needed, and arrangement of them in proper instructional order. For a course in human relations for technical supervisors, the analysis of the activities of the supervisor would bring out such items as the following:

Handling a grievance

Reprimanding a worker

Assigning a worker to a disagreeable task

Straightening out a quarrel between two workers

Many other items would be included. From these items the analyst works out the things the supervisor needs to know, and be, and do, to handle them properly. Then from these latter items the course of study is developed.

For courses in general education to be included in the technician training curriculum, the objectives sought are the knowledge and skills needed by the worker as a citizen in a democracy as well as a citizen in an industrial

work situation. Thus the content for a course in communication skills may well take into account the kinds of communication skills needed in the occupational field as well as those of the outside world. In developing such general education courses it is common practice to study what is included in similar courses in other institutions, to look over pertinent textbooks and reference books on the subject, and to combine the items into an integrated whole which suits the given situation.

Theoretically, courses of study should be developed, and detailed instructional units prepared, before one considers the matter of equipment and space for the program. Practical situations, however, require that some attention be given to potentialities with respect to equipment when the course is being developed. It is poor practice to design a course of study which required costly and elaborate equipment when such is not available and the budget does not permit its purchase. Unless reasonably adequate equipment can be made available, it is perhaps better that the courses not be offered. The course development process thus requires working back and forth between theoretically desirable items and those which are within the realm of possibility.

After the course outline has been prepared in tentative form it is good practice to check it for completeness and accuracy. Here is a check-list that contains many of the important items:

1. Is the title of the course clear-cut and meaningful?

2. Are the unit titles and the items of the outline stated clearly?

3. Is the content of the course outline appropriate for the setting in which it will be used?

4. Is the outline complete? Have items of importance been omitted?

5. Has proper emphasis been given to the various units of the course?

6. Are extraneous items included in the outline, items not pertinent to the course?

7. Is the over-all length of the course in keeping with its importance in the curriculum?

8. Is the course content classified into proper homogeneous groups or units?

9. Are the units arranged in appropriate order?

10. Is the outline in sufficient detail? in too much detail?

## CHAPTER 11. DETERMINING THE EQUIPMENT NEEDS FOR TECHNICIAN TRAINING PROGRAMS

The overall effectiveness of any technician training program is greatly influenced by the adequacy and appropriateness of the equipment provided, and the instructional aids furnished. It is poor economy to neglect to supply the equipment needed or to force the instructional content and methods into an inferior pattern brought about by equipment not suited to the needs of the program.

The task of training technicians is accomplished through the use of classrooms, drafting rooms, and laboratories. There is some need for shops such as those used for skilled crafts training which are equipped largely for the development of manipulative and tool skills. The laboratory has a very important place in the training program.

Among the educational objectives attained through effective use of laboratory training are the following:

1. Securing functioning understanding of principles of science.

   Examples are phase shift control in electronic tubes, or stress-strain relationships in tension testing.

2. Learning the properties and processing of materials.

   Examples are the properties of semiconductors, or the welding of alloy steels used in connection with nuclear reactors.

3. Learning the construction and operating principles of commercial equipment.

   Examples are the mechanisms used in a process control instrument, or the functioning of a rotary converter.

4. Developing ability to diagnose troubles in equipment.

   Examples are locating malfunctioning in a tape-controlled machine tool or in a radar unit.

5. Developing skill in utilizing technical principles in performing other types of technical tasks.

   Examples are skill in precision measurement of intricate products, or in testing of newly developed equipment.

To achieve these objectives through laboratory work requires a considerable variety of equipment carefully chosen to meet specific educational objectives. For achieving understanding of basic principles of science in the electrical field, the equipment needed would include meters, switches, electrical machines, control devices, resistors, capacitors, transformers, and many other items. For such an objective in the mechanical field, special equipment

would be required which demonstrates the use of simple machines such as levers, gears and cams; or principles of hydraulic or pneumatic pressures.

Laboratory equipment for studying properties of materials would include such items as heat treatment furnaces, tensile and compression testing machines, and hardness testers. Materials processing methods would be learned through selected metal working tools of toolroom and production types, and similar machines, if needed, for other materials than metal.

For the study of construction of commerical equipment and of operating principles of such equipment, typical machines and instruments would be needed. In some cases cutaway units might be used; in other cases units capable of operation would be needed. For trouble diagnosis training, the equipment needs are largely instruments and their accessories, together with the equipment on which the trouble is to be located.

The range of laboratory equipment needed for technician training programs is great, and the cost of such equipment can become a sizeable item in the capital outlay budget. It is therefore essential that much care be taken in determining just what equipment is needed to meet the demands of the program. Since each item of laboratory equipment serves one or more specific purposes in the training program, these purposes must be listed if the task of equipment selection is to be done well. The best approach is to prepare a detailed outline of each instructional unit in each course in the curriculum. Preferably the instructional units should be worked out by the course instructor. For each unit he would designate the equipment needed by each student performing the laboratory assignment. In some cases it is not possible to have the instructor make up the equipment list, and the task will need to be done by the head of the department or some other person who is familiar with the details of the instructional units of the course and the way in which they will be taught.

The quantity needed of each item of equipment will be influenced by such factors as the following:

1. The extent to which the item is used in more than one instructional unit in the course, or in other courses.

2. The number of students in the class.

3. The sequence and difficulty level of the instructional units in the course.

If each student had to start with instructional unit No. 1 in the course and continue in consecutive order through all the units, the quantity of equipment needed for this unit would be that required for a single student multiplied by the number of students in the class. That required for subsequent units would be determined in similar manner, taking into account items of equipment that were used in previous units. Ordinarily, however, it is possible to group together certain instructional units which do not depend upon each other in the sequence of learning, and which are of approximately equal difficulty, and spread the class group among these units. This

cuts down on the total equipment needed which is peculiar to specific units.

In some types of laboratory assignment it is permissible or preferable for students to work in small groups. In such cases the equipment needs are cut in accordance with the group size.

Drafting room equipment consists mainly of the drafting tables, drawing boards or drafting machines; and the instruments, scales, triangles, and other items which are often furnished by the student. In technician training, especially in courses involving design, it is desirable to provide drafting machines. The type and size will depend upon the nature of the design work. It is also necessary to provide some means of duplicating drawings.

Equipment needed for classrooms is limited to that used for demonstration purposes, and the audio-visual aids utilized to teach technical principles and practices. The specific items needed are obtained from careful study of the detailed instructional units which make up the courses to be taught in the classroom. The list of equipment for classroom use stems from the method of instruction used as well as from the items of content. Audio-visual aids find an important place of usefulness in classroom teaching in technician training programs. Many technical principles can be taught much more effectively when such aids are used. Each classroom instructor should have easy access to all the types of audio-visual aids he needs for his course. These include sound motion picture projectors, film strip and slide projectors, overhead projectors, and opaque projectors. If such equipment is readily available it will be used much more frequently than if the instructor has to put forth considerable effort to obtain the equipment when he needs it.

When the items of equipment needed are being determined from detailed study of the instructional units of the courses, it is well to take time to note the data which will be needed to set up specifications for purchase of the equipment. The completeness of the data in the specifications sometimes determines whether or not the order is filled promptly or whether the vendor may have to ask for further information. Among the factors which need to be taken into consideration when equipment specifications are being drawn are the following:

1. The sizes of equipment items.

2. The capacity and range of measuring instruments.

3. The precision required in instruments. This is an important element in its cost.

4. The ruggedness of instruments, an important element when they are used by beginning student.

5. The flexibility of use of machine or instrument.

6. The quality of machines and instruments, which has bearing on length of life and freedom from repairs.

The extent and type of housing, furnishings, and utilities required for a given laboratory should grow out of the equipment used for instructional purposes and the manner in which it is used. Close working relationships with the architect of a new building for technician training purposes will usually pay good dividends. Often the architect does not understand the real needs of the structure and will welcome information which well help him plan it for efficient use. Flexibility of partitions, adequacy of electrical wiring permitting increase of loads, functional design of laboratory tables and work benches, peripheral location of such benches to permit utilization of the central portion of the laboratory for special equipment, adequacy of storage space for equipment used only occasionally-- these are some of the items which need consideration.

A suggested laboratory layout for electrical instruction, together with an equipment list, is found in the U.S. Office of Education Bulletin OE-80006, "Electrical Technology".

# CHAPTER 12. DETERMINING THE NEEDS FOR INSTRUCTIONAL MATERIALS

The availability of pertinent instructional materials is of great importance in technician training. Since most of the learning is in the form of technical understandings, books and other printed materials are essential. It is thus desirable that considerable attention be given to determining the different kinds of instructional materials needed, and to make provision for securing them.

The term "instructional materials" as used here refers to the various kinds of printed materials used by the student, such as textbooks, reference books, handbooks, laboratory manuals, drawings, and study guides. Those used by the instructor include instructor guides; charts and drawings for classroom presentation purposes; films, film strips, slides and other transparencies; assignment or other sheets for use as handouts to students; and text and reference books used in preparing for class sessions.

The needs for instructional materials are derived from detailed analysis of the instructional units which make up the course. Perhaps the most effective instructional materials take the form of a textbook or a laboratory workbook prepared by the person who teaches the course. Then the course content could be arranged in effective teaching order, the assignments made in accordance with the specific equipment available. This assumes that the instructor of the course is also an effective writer. Usually, however, the textbook for a course, or more than one textbook if necessary, must come from those available from commercial publishers or similar sources. It is not desirable that a well-prepared course of study be altered to fit a given textbook, but sometimes modifications must be made in course outlines in accordance with what is available in textbooks. Such modifications should be kept to a minimum, and other ways found to supplement the selected textbook in order to provide pertinent missing material.

The selection of textbook for a given course may well take into account such factors as the following:

1. The content coverage of the textbook in relation to the content included in the course outline.

2. The ability level required for mastery of the text material.

3. The extent and depth of basic educational background, such as science and mathematics, needed to understand the explanations of the text.

4. The number of illustrations and their effective usage.

5. The readability of the text material as evidenced by sentence length, size of words, etc.

6. The up-to-dateness of the content.

Similar items should be taken into account when selecting a laboratory manual for a given course. But laboratory manual content must gear in with the equipment available. Thus it is often difficult to find a published manual which fits the needs of the specific situation, unless the course content is built around the content found in the manual, and equipment secured in accord with that content. In some of the basic laboratory courses, such as physics or basic electricity, well prepared manuals are available from commercial publishers. For such laboratory courses it is frequently desirable to use commercially available manuals. In selecting such a manual, some factors to be considered are as follows:

1. The format of the material for each instructional unit. A good format will indicate clearly the steps to be followed, in a manner which is readily understood by the student.

2. The clarity of the drawings or other illustrations used in outlining the laboratory procedure.

3. The usability of the manual in a laboratory situation, involving such items as page size, lying flat when opened, proximity of drawing and accompanying procedural instructions, etc.

For advanced courses in technology the available equipment has controlling influence over the laboratory manual. If the equipment takes a standardized pattern -- as with the case of certain commercially available laboratory panels for electronics instruction -- laboratory assignment sheets may be available for each panel unit, or combination of units. Usually, however, it is necessary to prepare the laboratory assignments for each unit of advanced courses, building these assignment sheets around the available equipment.

Written instructional materials suitable for technician training programs are available from a variety of sources. Publishers of textbooks who have specialized over the years in the various fields of engineering are now giving some attention to materials designed for applied technology on the two-year post-high school level. Publishers whose main field has been that of skilled trades training are now providing some offerings in the technician field.

A number of trade associations have become concerned with the porblem of instructional materials in their respective fields. Manufacturers of technical equipment frequently provide operating manuals and service manuals. Many publications prepared by governmental organizations to meet their own training needs, and which have been made available through the Superintendent of Documents, find a useful place in technician training programs. This is especially true with respect to some of the basic courses in science and technology, such as those prepared for use in schools operated by the Armed Services.

Several States have established instructional materials laboratories for the purpose of developing operation sheets, information sheets, etc., especially for use in skilled trades training programs. Some of these laboratories are

now giving some attention to materials for training programs for technicians.

Since audio-visual aids find such an important place in classroom teaching in the technician field, it is desirable that such aids be made available for each course in which they can be effectively used. Motion picture films are especially useful in teaching the basic principles of electricity and electronics, for showing industrial practices which are sometimes taught by field trips, and for illustrating technical principles in complicated machines. If the cost were not prohibitive it would be desirable to purchase and have readily available all the pertinent motion picture films which find a really useful place in the classroom teaching. Usually, however, the most sensible practice is to purchase those films which are used frequently, and to obtain those used only occasionally through rental.

Film strips are more effective than motion pictures for certain types of instruction. They are available in great variety in the fields of basic science, mathematics, and technology. They are relatively inexpensive, and the good school will have them in goodly numbers.

The overhead projector, which uses transparencies up to 10" x 10" in size, is finding increasing use in the field of technical teaching. Transparencies are easily made by preparing the copy -- drawings, lettering, or type -- on translucent paper and making a print on sensitized transparent film which is developed by the ammonia process. Overlays of successive sheets of film -- sometimes in color as well as black lines -- are effective for some types of teaching. New processes for producing projection transparencies are now being made available, such as the Thermo-Fax transparencies made from printed or other copy in only a very short time. Transparencies usually are prepared in the school where they are used.

When suitable instructional materials of various types cannot be obtained by purchase from publishers, it is necessary to prepare them in the school. Preferably this should be done by persons skilled in preparing such materials, working in cooperation with the course instructor. In reproducing such materials the offset printing process is preferable to stencil duplication especially when the copy contains detailed drawings.

The school which offers technical training should be provided with a well-stocked library. Reference books of the appropriate types and levels should be available in all the occuaptional fields for which training is offered. Of special importance is the need for technical periodicals. The technology of industry is changing so rapidly that much of the current material is found only in periodicals. Another source of valuable information is the technical publication of the house organ type published by several manufacturers of technical equipment. Pertinent publications of governmental agencies should also be included. The library of course should also be provided with books and periodicals dealing with the fields represented in the general education courses included in the various curriculums.

## CHAPTER 13. INSTRUCTIONAL STAFF QUALIFICATIONS, RECRUITMENT AND TRAINING

One of the problems to be faced in setting up a program for the training of technicians is that of securing qualified instructors. The present-day employment opportunities in industry for persons with similar qualifications are extensive, and the salaries paid are usually in excess of what educational institutions can provide. But there are many persons who are willing to sacrifice some financial compensation for the other rewards which come from teaching. A good technician training program requires well-qualified instructors, and every effort should be made to secure the type of persons needed.

The general requirements for instructors would include the following:

1. A clear understanding of the place which technician training programs fill in the total educational pattern.

2. A functional understanding of human growth and development, of how persons learn, and of the problems faced by students in technical training.

3. Ability to use efficient and effective methods of teaching technical subjects.

4. A thorough understanding of the content in the field of specialization, together with mastery of the technical skills involved.

5. A clearly balanced appreciation of the functions of both occupational and general education content in the curriculum.

6. Ability to organize technical instructional content into suitable form for teaching.

7. A real interest in helping persons to learn.

8. Ability to fit into a faculty group as a member of the team.

In most types of occupational training it is necessary to recruit persons for instructional service who do not meet all the qualifications which are desired.

Since occupational competency is of prime importance in an instructor, this is usually clearly specified when qualifications for the instructor are set up. Closely allied with occupational competency, in the case of teachers in technician training programs, is technical education background. If it is practicable to require competency in professional education as a prerequisite to employment, this is also specified. But frequently it is impossible to recruit persons with all these competencies, and also with satisfactory personality traits. So the stated qualifications specify the occupational experience and technical education requirements, and make

provision for acquiring the needed professional education training after entering upon the teaching job.

A rough measure of occupational competency is length of employment in responsible positions in the technician field, preferably in different specific jobs which show progression from one job to another on a higher level of difficulty or responsibility. Occupational competency can also be measured by a carefully prepared practical examination, of sufficient length to sample typical technician tasks of the specific field. The qualifications set up for instructors might thus include (x) years of appropriate experience, supplemented by a practical examination if desirable.

Technical knowledge and understanding can be appraised by the amount of technical training completed in approved technical institutions. Thus the qualifications set up might include graduation from a four-year (or a two-year) technical curriculum in the field of specialization.

Competency in professional education is usually measured by the amount of course work completed which is appropriate to the field of teaching in a technician training program. Courses of this type would include educational psychology, methods of teaching technical subjects, course-of-study building in technical education, and supervised practice teaching. It is often practicable to require six semester hours of course work in education prior to appointment as an instructor -- a normal load of courses for one six-week summer session -- and to require that additional course work be taken within two or three years after appointment.

At present few trained instructors are available from teacher training institutions. The requirement of occupational experience usually makes it necessary for the graduate of the technical teacher training program to enter industry to obtain the needed experience subsequent to his completion of the training program.

Some institutions are able to secure instructors from other similar schools, or from technical high schools. In some cases persons with technical training and experience are obtained from vocational high schools. Also some instructors in technician training come from engineering college faculties, or from retired military personnel who have had technical training and experience. Some instructors have had previous teaching experience in technical schools of the Armed Forces. Sometimes it is possible to recruit industrial arts teachers who have strong backgrounds in mathematics and science and who have had adequate experience in technical work in industry or in the Armed Forces. Some institutions have arranged with nearby industries for part-time teaching service on the part of technical personnel employed by the industries.

Instructors of general education subjects in post-high school technician training programs frequently are required to meet qualifications similar to those set up for junior college teaching. A bachelor's degree in the field of specialization to be taught is usually required; and often a master's degree is specified. The professional courses in education often are included in the undergraduate or graduate study, yet sometimes it is

necessary to recruit persons who have satisfactory subject matter background but nc professional education courses and to provide such courses as are needed after the instructor begins work.

Along with the rapid nation-wide growth in technician training programs has come increased interest and activity in the development of teacher training programs for this field. Some of these programs recruit technically competent persons employed in industry and provide the professional education courses, specifically designed for teachers in technician training, through evening classes which are readily accessible to these employed technical workers. Such persons frequently are hired for evening school teaching to permit them to see if they really like technical teaching; later they may be employed as full-time instructors.

Other teacher training programs combine the technical training with the professional education in four-year full-time programs. Subsequent to graduation the required practical experience in industry is obtained before entering a teaching position.

A well-planned program makes provision for keeping its instructional staff up to date with respect to technological developments. Instructors are encouraged to read technical periodicals, participate in the activities of professional technical association, and pursue courses in technology. Special summer programs for bringing instructors up to date in the technology of specific fields are being made available by some teacher training institutions, often in cooperation with large manufacturers of technical equipment, or with agencies such as the National Science Foundation. Similarly there is need for opportunity for instructors to grow in instructional ability, through visits to other similar schools, attendance at pertinent educational conferences, and through reading of professional educational literature. In setting up the technician training program it is well to keep in mind these long-term needs as well as the immediate ones.

## CHAPTER 14. SETTING UP STUDENT RECRUITING SELECTION AND PLACEMENT PROCEDURES

A well-planned recruiting program is essential to any pre-employment training offered in the technician field. There is great lack of understanding of technician occupations, and of programs designed to prepare persons for these types of occupations. The term "technician" is largely meaningless to most high school students, and to many high school teachers and counselors. If the institutions which provide technician training are to recruit qualified students, these persons must be brought to an understanding of technician occupations and technician training programs. This is no easy task, and will require much effort and ingenuity.

The first portion of the task is to help high school students and teachers to acquire a good understanding of the range of technician occupations, and the requirements and rewards of such occupations. The second portion of the task is to get qualified students sufficiently interested in this field of training so that they will make application for admission to the instruction which provides the necessary training.

Technician occupations are not easy to define. Increasingly, however, literature is being made available for this purpose. Bulletins describing careers in technician occupations might be obtained and made available to prospective students. An example is the bulletin issued by the General Motors Corporation - "Can I Become a Technician?". Similar material might well be incorporated in the catalog of the institution. Other means discussed later in this chapter may be useful also.

After the prospective student has gotten a true picture of technician occupations and has developed an interest in securing such training, he considers a number of items when choosing a school. Among these items are the following:

1. The proximity of the school to his home.
2. How much it will cost him to complete the program.
3. The prestige of the school -- its standing in the community.
4. The placement record of the school, and success of its graduates.
5. The plant and equipment of the school.
6. The character and attractiveness of the promotional literature of the school.
7. The general character of the curriculum, with special reference to its apparent practicalness in providing the needed training.

It is recognized that some of the above items grow out of a program which has been in operation for some time, yet they may be influenced by proper initial planning.

The recruiting function of the school is too important to be allocated as a minor part-time assignment of a busy principal or director. To be effective it requires careful planning and regular attention. Among the tasks involved in recruiting, which are frequently used by technician training institutions, are the following:

1. Periodic visits to feeder high schools, to confer with teachers, prospective students, and others; and to speak at school assemblies.

2. Sending of appropriate publicity material to high schools, to prospective students, and to other interested persons.

3. Planning and holding open house or visitor's day for prospective students, their families and friends.

4. Special efforts to acquaint high school counselors with information concerning occupational requirements and rewards in the technician field.

5. Miscellaneous tasks such as preparation of news release, addresses made before civic groups, preparation of printed publicity material, etc. Parent-teacher groups in junior and senior high schools are important and fruitful contacts.

The success of any technician training program is influenced greatly by the effectiveness of the student selection procedures. The level of ability required to master the technical content of the curriculum, and the basic mathematics and science, calls for students who are above the average run of high school graduates. Unless the selection process weeds out those who cannot meet the standards, either the proportion of drop-outs will be excessive or the standards will eventually have to be lowered.

The selection procedure usually involves a personal interview with the prospective student to appraise certain aspects of his personality, an examination of the character and quality of the work completed in high school, and may include the use of selected tests.

The examination of the high school record should reveal the general academic ability of the student, the courses taken which are included among the admission standards, and his success in these courses. Often the high school record is supplemented by a statement by the principal, and a record of the relative standing of the student in his graduating class. These factors are appraised in the light of the specific standards set for admission.

The use of selected standardized tests as a criterion of admission seems to be increasing in popularity. The types of tests used in various institutions include the following:

1. General scholastic aptitude tests, such as the American Council on Education Psychological Examination for high school students, or the California Test of Mental Ability.

2. Educational and Vocational aptitude tests such as:

   a) Differential Aptitude Tests (Psychological Corporation), involving verbal reasoning, numerical ability, abstract reasoning, special relations, mechanical reasoning, clerical speed and accuracy, and language usage.

   b) General Aptitude Test Battery - Grade 12 and above, U.S. Employment Service), which provides measures in the following basic aptitudes: Intelligence, verbal, numerical, spatial, from perception, clerical, aiming, motor speed, finger dexterity, and manual dexterity.

   c) Engineering and Physical Science Aptitude Test - Grade 12 and technical school entrants (Psychological Corporation). Measures in mathematics, formulation, physical science comprehension, arithmetic reasoning, verbal comprehension, and mechanical comprehension.

3. Educational achievement tests, such as Essential High School Content Battery for grades 9-13 (World Book Co.), which measures achievement in mathematics, science, social studies and English.

4. Interest inventories, such as:

   a) Kuder Preference Record - Vocational - grades 9-16 (Science Research Associates)

   b) Strong Vocational Interest Blank Revised - ages 17 and over - (Stanford University Press)

   c) Interest Check List - (U.S. Employment Service)

Cooperative arrangements have been worked out in some states between the technician training institution and the State Employment Service whereby the latter gives the tests to the prospective students and reports the findings to the school. Cut-off scores are established for the various tests, and revised as needed in the light of experience in the school.

The large amount of work involved in the selection of students prior to the opening of the school year often necessitates the establishment of a faculty committee for this purpose.

Some students who apply for admission meet all the requirements except the completion of required high school courses in mathematics or science, or such students may be lacking certain portions of these courses. In some cases the technician training school sets up make-up courses, offered during the summer or concurrent with the courses offered during the school year. Students with deficiencies are required to complete these courses.

The placement of graduates in suitable job openings is one of the services usually performed by institutions offering technician training. Although this function does not take place until after the program has been in

operation for two years it is well to make plans for carrying it out well in advance. The placement market was taken into consideration when the initial planning was made, especially the local one. But graduates of these programs often find jobs at considerable distances from the school, and this must be kept in mind when the placement program is being planned. Good relationships with prospective employers of graduates may well be established long before the actual placements are made, through keeping the employer informed concerning the program offered, encouraging visits of industrial recruiters to the school, and in other ways.

Placement records provide information of value in promotion of the program, and in furnishing data which are useful in program planning and revision. Care in setting up good records and in maintaining them usually pays good dividends. They are especially useful in follow-up studies of graduates which are a desirable means of maintaining good personnel relationships with these graduates as well as providing information needed for periodic checking of the program.

## CHAPTER 15. ESTABLISHING EFFECTIVE PUBLIC RELATIONSHIPS

Every educational institution needs good relationships with the public and with various other types of institutions. This is especially true with educational programs designed to provide training in the technician field since such programs are not well known. The purposes of public relations include the following:

1. Developing a public understanding of technician occupations, and of training programs which prepare persons for this field.

2. Developing recognition and prestige of the institution.

3. Developing a favorable attitude toward financial support of the program.

4. Aiding in the recruiting of qualified students.

5. Getting the cooperation of industrial establishments of the community in such matters as consulting service on technical problems and part-time use of industrial technical personnel as instructors.

6. Placing of graduates in appropriate jobs.

To attain these objectives the technician training institution needs a broad program of public relations which will reach the average citizen as well as the larger employers.

It will not be an easy task to acquaint the general public with the nature of technician occupations. They are not easy to define, and they merge into engineering occupations on the one hand, and into the skilled crafts, on the other. Descriptive literature, suitable newspaper releases, appropriate meetings with interested groups, and extensive person-to-person discussion of the training program and the technician field may be among the means used to attain the desired goals.

Favorable prestige of an educational program is influenced by the level on which it is operated; and by the apparent quality of the program offerings, the physical plant, and the equipment. The standards of admission for students exert considerable influence. Also of importance may be accreditation by state or professional agencies. Prestige is a very important element in the growth and development of educational institutions. High prestige attracts good faculty members, and good students, and influences the placement of the graduates. High standards in all aspects of the program, and effective means of acquainting outside persons with these standards, may well have a place of importance in program planning.

In the long run the public financial support given to an educational institution is a reflection of the worth of the program is the eyes of the taxpayers. It is thus essential that the public be made aware of the nature

and the value of the institution. High quality technician training is of economic value to the community and the State. If the area is concerned with attracting new industries which require technical personnel, an effective program for providing such training on a pre-employment basis as well as for employed workers is a real asset. Its cost can be justified to taxpayers as an investment rather than an expense.

Among the outside relationships which the institution should cultivate is that with the State Employment Service. This organization is in position to render effective service in the making of occupational surveys, in the analysis of technician occupations, and in the testing of prospective students. The Employment Service has specialists in these fields, has some funds for these purposes, and usually is pleased to cooperate.

Perhaps the most important single group with which effective working relationships should be established is the employers of the community. They are in position to cooperate in providing information on needs for technicians and on occupational descriptions. They often make it possible for qualified technical employees to teach part time in the institution. Their personnel serves on advisory committees, and gives advice on equipment and practices. They employ many of the graduates. As large taxpayers they have influence on the financing of the programs. Since the need for technicians in many areas is great, and is apparently growing, employers are usually glad to help in the establishment and development of technician training.

Many technician occupations border closely on the skilled crafts, and some of them require experience as craftmen. Labor unions concerned with such skilled crafts, as well as labor organizations of technicians, are thus among the groups with which effective relationships need to be established and maintained. Representatives of such organizations serve on advisory committees and assist in other ways.

Increasing interest in the field of technician training is being shown on the part of certain professional associations, in the technical fields as well as in education. To the extent that the technician training institution can maintain working relations with such organizations, through contact with local branches and the like, this is to be desired.

All in all, the task of developing good public relations is a large one, but is sufficiently important to warrant considerable effort on the part of the educational administrator.

## BIBLIOGRAPHY

Allee, David W. Planning the Plant for Technician Training. School Shop, 18:8; April 1959.

Deals with determination of facilities needed, functional utilization, architectural and structural planning to facilitate effective instruction. Includes suggestions for specific features in electronics and machine tool laboratories.

American Society For Engineering Education--Technical Institute Division. Committee Report on Curriculum Development. Technical Education News, 18:1; Special Issue 1958.

Includes table showing percentage of contact hours devoted to basic science, technical specialty, allied technical specialty, administrative-managerial, and general education subjects in technical institute curriculums in 1957 as compared with 1949. Covers eight technologies: electronics, air conditioning, architecture, aeronautics, mechanical, electrical, automotive and civil.

Board of Education of the Vocational Schools in the County of Middlesex. Survey of the Need for Vocational-Technical Education in Middlesex County, New Jersey. New Brunswick, N.J., The Board. 1960. 147 p.

Describes the industrial and economic situation in Middlesex County. Reports survey findings with respect to laboratory technicians, engineering technicians, electronics technician, instrument mechanics and technicians, draftsmen, miscellaneous technicians, and many of the skilled trades. Gives data on training opportunities available, and on enrollments in schools. Includes copy of the survey form used in the study.

Boaz, Ted. How Much Does it Cost to Develop an Instrument Laboratory? Technical Education News, 18:5; May 1959.

Describes the curriculum in industrial instrument technology at Del Mar Technical Institute. Outlines the physical plant and details of the laboratory equipment.

Brandon, George L. Twin City Technicians. East Lansing, Michigan, State University, 1958.

Reports the findings of a survey of Benton Harbor and St. Joseph, Michigan, showing the kinds of technician occupations found and the job titles used. Describes the activities of these technicians in working with equipment, instruments, industrial materials, hand and machine tools, drawings and other records, and with energy and power. Describes the

occupational survey techniques used, and includes a copy of the survey instrument.

Brookins, J.E. and Purvine, W.D. Training in Civil Technology. School Shop, 18:8; April 1959.

Outlines the curriculum in civil technology at Oregon Technical Institute, with majors in drafting technology, highway technology, structural design technology, and surveying technology. Gives brief description of facilities and equipment. Discusses employment opportunities, graduate placement, drop-out experience, and relations with industry.

Flesher, W.R. Public Vocational-Technical Education in Oregon, (Report of a Survey Made for the Oregon State Board of Education.) Columbus, Ohio, School Survey Service, 1958.

Contains a chapter on technical institute education in Oregon, including a comprehensive description of curricula, staff, physical plant, student body, and graduates of Oregon Technical Institute.

Harrington, Gordon M. Technicians for Connecticut Industry. Hartford, Conn., State Department of Education, 1957.

Outlines the place of the technician in industry in relation to the engineer and the skilled mechanic; gives brief descriptions of several technician occupations; and reports the findings of a survey of technician needs in Connecticut. Reports on a survey of student potential. Outlines a proprosed program of technical institutes for the State.

Henninger, G. Ross. The Technical Institute in America. New York, McGraw-Hill Book Co., 1959. 276 p.

A report of the National Survey of Technical Institute Education made by the American Society for Engineering Education. Discusses the philosophy and objectives of the technical institute, curriculum patterns, the institute student body, faculty, physical plant, administrative pattern, and financial structure. Appendices include typical occupational opportunities for graduates; typical curriculums in industrial electronics, structural design technology, electrical engineering technology, industrial technology, and machine construction and tool design, together with course descriptions; and data from follow-up studies of graduates.

Kansas State Board for Vocational Education. Training Needs of Highly Skilled Technicians in Twenty-Three Selected Manufacturing and Processing Firms in Kansas. Topeka, Kansas, The Board, 1959. 138 p.

A condensed report of a thesis by Merle W. Bodine at Kansas State

College of Pittsburg. Presents data on 42 technical occupations representing 830 highly skilled technicians. Classifications used are engineering technicians, electronic technicians, production technicians, laboratory technicians, maintenance technicians, and distributive technicians. The report includes frequency of work activities; and functional understanding needed in science, mathematics, and human relations. Includes information on the survey instrument used and the survey procedures.

Kansas City (Missouri) Board of Education. Skilled and Technical Workers in Greater Kansas City - A Survey of Supply and Demand Factors. Kansas City, The Board of Education, 1958.

Outlines the procedures followed in carrying through the survey. Analyzes the findings with respect to present workers and potential needs, and draws conclusions concerning educational program planning. Includes sample forms used in the survey.

Michigan State Department of Public Instruction, Division of Vocational Education. Industrial Technical Education in Michigan. Lansing, Michigan, The Division, 1959. (Bulletin 2139) 58 p.

A descriptive bulletin of technician training. Describes the technician; shows needs for technicians in industry; discusses the role of guidance in technician education, including suggested tests; describes technician training on high school and post-high school levels, including curriculum patterns in several occupational fields. Includes selected bibliography.

Roanoke Chamber of Commerce. A Technical Institute in Roanoke to Serve Western Virginia. Roanoke, Virginia, Chamber of Commerce, 1957.

Describes procedures followed in making preliminary studies of technical institute education and of the needs of the area for this type of education; outlines recommendations for establishing a technical institute in Roanoke, including sponsorship, curriculums to be offered, plant and equipment, administration, financing, and admissions and recruitment.

Smith, Leo F., and Lipsett, Laurence. The Technical Institute. McGraw-Hill Book Co., 1956. 319 p.

Describes the technical institute and its historical development, presents a broad overview of curriculums and their components; discusses careers of graduates. Outlines the procedures used in organizing and administering technical institute programs, including determination of objectives, surveying the demand, developing curriculums, qualifications of instructional staff, recruiting and selection of students, student personnel services, and administration of programs.

Technical Institute Curriculums -- Typical curriculums described in various issues of Technical Education News:

Air Conditioning and Refrigeration. University of Houston, T.E.N., 16:9; July 1957.

Aircraft Technology. Academy of Aeronautics. T.E.N. 11:6; October 1951.

Architectural Construction, Wentworth Institute. T.E.N., 12:10; August 1953.

Automotive Technology. The Technical Institute, Oklahoma State University, T.E.N., 19:3; January 1960.

Civil Technology - Highway Major. Oregon Technical Institute. T.E.N. 19:3; January 1960.

Computer Technology. Milwaukee School of Engineering, T.E.N. 17:3; September 1958.

Diesel and Stationary Engines. The Technical Institute, Oklahoma State University. T.E.N., 11:8; April 1952.

Drafting and Design. Penn. State Technical Institutes. T.E.N., 13:2; May 1954.

Electrical (Cooperative). Rochester Institute of Technology. T.E.N., 12:1, May 1953.

Electronics Technology. Lansing Community College. T.E.N., 19:5; May 1960.

Engineering Physics. Broome Technical Community College. T.E.N., 18:3; February 1959.

Gas Fuel Technology. Southern Technical Institute. T.E.N., 10:6; January 1951.

Industrial Chemistry. Erie County Technical Institute. T.E.N., 14:7; April 1955.

Industrial Instrumentation. Ward School of Electronics. T.E.N., 18:3; February 1959.

Industrial Laboratory Technology. Hudson Valley Technical Institute. T.E.N., 15:14; September 1956.

Industrial Supervision Technology Lawrence Institute of Technology. T.E.N., 12:6; May 1953.

Industrial Technology. Southern Technical Institute. T.E.N., 14:2; December 1954.

Mechanical Technology. State University Agricultural & Technical Institute, Alfred, New York. T.E.N., 19:2; November 1959.

Radio and Televison Broadcasting. Central Radio and Television Schools. T.E.N., 12:7; November 1952.

Tool Technology. State Technical Institute, Hartford. T.E.N., 14:7; December 1954.

Twork, Lester A. Training Metallurgical Technicians. School Shop, 18:8; April 1959.

Describes in some detail the program of the Henry Ford Community College, including physical plant, metallurgical curriculum, instructional content and equipment for the specific metallurgical courses, entrance requirement, relationships with industry, and placement procedure.

U. S. Department of Health, Education, and Welfare, Office of Education. Curriculum Materials for Trade and Industrial Education. Washington, U. S. Government Printing Office, 1961. (OE-84023)

A listing of materials available from State and local sources, including course outlines, study guides, work books, leaders' manuals, and the like. Includes considerable material dealing with technical occupations.

U. S. Department of Health, Education, and Welfare, Office of Education. Electrical Technology -- Suggested Curriculum, Course Outlines, Laboratory Layouts and Equipment Lists. Washington, U. S. Government Printing Office, 1960. (OE-80006)

Presents a suggested two-year post-high school program of instruction in electrical technology, including the curriculum, course outlines, laboratory layouts, equipment lists, supply lists, and sample instructional materials.

U. S. Department of Health, Education, and Welfare, Office of Education. Electronic Technology -- Suggested Curriculum, Course Outlines, Laboratory Layouts and Equipments Lists. Washington, U. S. Government Printing Office 1960. (OE-80009)

Presents a suggested two-year post-high school program of instruction in electronic technology, including the curriculum, course outlines, laboratory layouts, equipment lists, supply lists, and sample instructional materials.

U. S. Department of Health, Education, and Welfare, Office of Education. Electrical and Electronic Technology. Washington, U. S. Government Printing Office, 1959. (OE-80004) 34 p.

Describes fields of work in which electrical technicians and electronic technicians are employed. Discusses job relationships and the grouping of jobs into clusters for training purposes. Gives detailed job descriptions for fourteen occupations. Outlines the subject matter required for a training program, and suggests procedures for developing curriculums.

U. S. Department of Health, Education, and Welfare, Office of Education. Mechanical Drafting and Design Technology. Washington, U. S. Government Printing Office, 1959. (OE-80000)

Outlines fields of work in which technicians are employed in mechanical drafting and design, and describes typical activities in these fields. Discusses job relationships useful for grouping jobs into clusters for training purposes. Provides detailed job descriptions for fifteen occupations. Outlines a procedure for determining training requirements from the job analyses.

U. S. Department of Health, Education, and Welfare, Office of Education. Organization and Effective Use of Advisory Committees. Washington, U. S. Government Printing Office, 1961. (OE-84009)

Outlines the types and functions of committees, the establishment and organization of committees, the planning of programs for committee consideration, and the conducting of meetings. Although aimed principally at committee service for skilled crafts and apprentice training, it has much in common with advisory committees for technician training.

U. S. Department of Health, Education, and Welfare, Office of Education. Organized Occupational Curriculums: Enrollments and Graduates, 1957; Washington, U. S. Government Printing Office, 1959. (Circular No. 568)

Lists curriculums of semi-professional character in various occupational fields, together with enrollments and graduates, in several hundred technical institutes, junior colleges, four-year colleges and similar institutions. Provides data concerning enrollments in curriculum of technician training for business, agriculture, health and medical services, and other fields, as well as for industrial occupations.

U. S. Department of Health, Education, and Welfare, Office of Education. Three-Dimensional Teaching Aids for Trade and Industrial Education. Washington, U.S. Government Printing Office, 1961. (OE-84024)

Description and photographs of various types of demonstration devices, many of which can be fabricated from low-cost materials. Includes much of value in technician training.

U. S. Department of Health, Education, and Welfare, Office of Education. Vocational-Technical Education for American Industry. Washington, U. S. Government Printing Office, 1958. (Circular No. 530)

Defines vocational-technical occupations; outlines various types of training programs; includes a considerable number of references.

U. S. Department of Labor, Bureau of Employment Security. Technical Occupations in Research, Design, and Development. Washington, U. S. Government Printing Office, 1961. (BES No. E-194)

Deals with technical occupations that could be identified as being concerned with research, design and development activities and considered directly supporting to engineers and physical scientists. Describes a total of 65 general and specific job activities found in some 85 establishments in various parts of the country.

Veterans Administration. Employment Outlook for Technicians. Washington, U. S. Government Printing Office, 1958. (VA Pamphlet 22-1)

Describes the nature of the work of technicians, where technicians are employed, how to become a technician, earnings, and employment trends. Provides information on the duties of technicians in several occupational fields.

Wood, Herbert S. A Study of Technical Education in California. Sacramento, State Department of Education, 1959.

Describes the need for technician training, duties and training needs of technicians, and status of technical education in California. Gives guidelines for planning, operating and evaluating a technical education program. Provides a guide to the community occupational survey, and includes selected survey forms.

*TECHNICAL EDUCATION; *JUNIOR COLLEGES; *PROGRAM GUIDES; *PROGRAM DEVELOPMENT; PROGRAM ADMINISTRATION; TECHNICAL OCCUPATIONS; *STATE SURVEYS; GUIDELINES; CURRICULUM; EMPLOYMENT OPPORTUNITIES; PROGRAM PLANNING; OCCUPATIONAL INFORMATION; PROGRAM EVALUATION; OCCUPATIONAL SURVEYS; QUESTIONNAIRES
CALIFORNIA

The general purposes of the project were to study industry and public service requirements for trained technical employees and to examine the contributions of the junior colleges in training such personnel. Information on technical education in California colleges and other post-high school and technical institutions in various parts of the United States was acquired by personal interviews with different levels of educators involved in technical education, analysis of institutional catalogs, and a review of pertinent literature. Information on industrial technicians requirements was acquired by consultation with personnel directors, and a review of employment studies and other relevant literature. The findings were used as a basis for preparing a set of guidelines for organizing, operating, and evaluating technical education programs in junior colleges to help alleviate the serious and growing shortage of adequately trained technicians resulting from the changes and the expansion of industry, the many new applications of scientific development, and growing recognition of the importance of the technician in industrial manpower, and the serious lack of adequate technician training facilities. The guidelines provide information for determining needs for training, developing the curriculum, selecting instructors, planning facilities, counseling and selecting students, recruiting students, organizing a public relations program, determining and maintaining quality instruction, maintaining liaison with industry, and evaluating the program. The appendix includes a guide to the community occupational survey and selected survey and followup forms. (HC)

# A STUDY OF TECHNICAL EDUCATION IN CALIFORNIA

with Guidelines for the Development and Operation of Technical Education Programs in the Junior College

*Prepared by*

**Herbert S. Wood**
Special Supervisor, Technical Education
Bureau of Industrial Education

## FOREWORD

In recent years, the need for well-trained and competent technicians has increased at a phenomenal rate because of technological changes in industry. One of today's most rapidly growing demands on education is for technical training to meet the need for technicians. The need for a technical education program in California has been met almost exclusively by the junior college, except for the training given within industry itself. California junior colleges are faced with an ever-increasing challenge to keep abreast of the demand and to anticipate local needs with well-planned and well-organized curriculums in the field of technical education. Many California junior colleges, especially those in areas in which there is a high concentration of industrial development, have been meeting this challenge in a pioneering spirit to the limit of their resources and abilities.

During the course of the study of technical education in California that is reported in this bulletin, an examination was made of practices and procedures followed by the junior colleges of the state and of technical institutes and other post-high-school institutions in various parts of the United States. The findings of this study were used as a basis for the presentation of a set of guidelines that can be helpful in the organization, operation, and evaluation of technical education programs in the junior colleges of California.

The urgent need of industry for well-trained and competent technicians is of such import to the welfare of the state and nation that all California junior colleges, as well as all persons concerned with education, should study carefully the contribution that they can make toward providing the training needed.

Roy E Simpson

*Superintendent of Public Instruction*

## PREFACE

In recent years, it has become obvious that the tremendous expansion of industry and the remarkable growth in the demand for trained and competent technicians that accompanied it have created a need for a realistic working philosophy of technical education and its purposes and structure. It has also become obvious that a need exists for a set of guidelines that would give greater unity to the program in all localities without imposing the deadening effect of uniformity. The California State Department of Education, the California Junior College Association, and the University of California, recognizing the need for such guidelines and for specific study of the problems involved in technical education, carried out a co-operative study during the years between 1946 and 1949. This study resulted in the publication by the State Department of Education, in 1949, of a bulletin entitled *Vocational Education in the Junior College.*

A second study of technical education in California, which is reported in this bulletin, was conducted during 1958-59 by the Bureau of Industrial Education of the California State Department of Education. Herbert S. Wood, former Director of Los Angeles Trade Technical Junior College, was added to the staff of the Bureau of Industrial Education as Special Supervisor of Technical Education to co-ordinate this study and to prepare a report that would provide for the needed guidelines for the development and operation of technical education programs in the junior college.

The co-ordinator of the study visited most of the junior colleges in California; talked with their presidents, deans, co-ordinators, and teachers; analyzed their catalogs and bulletins; conferred with county, city, and district school officials throughout California; and spent two weeks in states outside California visiting technical institutes and other schools having technical education programs. He studied the literature on the technician and technical education extensively. Following the termination of these activities, the co-ordinator prepared the report, which brings together information concerning successful programs, practices, methods, and techniques; points out certain critical problems that need attention but that were beyond the scope of this study; and presents some guidelines that can be used in establishing, operating, and evaluating a technical education program.

The report of the study does not attempt a precise definition of the technician nor of technical education but presents a description of

what the technician does and what he needs to know—the skills and knowledge of the particular occupation of which his training program must be built.

The guidelines, which are presented in Chapter VI of the report, should be of special value and interest. These guidelines included do not constitute, in themselves, a precise instrument for the evaluation of technical education programs but may be used to construct an instrument for such evaluation. It is hoped that through experience in the use of these guidelines, improved and valid evaluation instruments will be devised to assist in the improvement of technical education programs.

Sincere appreciation is expressed for the generous and helpful participation by the many interested people who assisted in the study and who reviewed this report and made suggestions for its improvement.

JAY DAVIS CONNER
*Associate Superintendent of Public Instruction; and Chief, Division of Instruction*

SAMUEL L. FICK

## CHAPTER I

# PURPOSES AND PROCEDURES OF THE STUDY

Although national and state attention have been given for many years to the problems involved in providing technical education for the youth of our country, it was not until during the years of World War II that activity in this field of education was intensified. Therefore, the study of technical education reported in this bulletin was concerned primarily with activities since that time.

### *Historical Background*

In March, 1943, John W. Studebaker, U. S. Commissioner of Education, appointed a nation-wide consulting committee of 25 members representing the interests of management, labor, and education, including engineering colleges, technical institutes, and vocational education. The committee, known as the Consulting Committee on Vocational-Technical Training, was directed to study the problems of vocational-technical education and to report to the Commissioner its findings and recommendations. The results of the committee's work were published as a bulletin of the U. S. Office of Education. Included in the foreword of this bulletin is the following statement:

> It is only natural, then, that at this period in our industrial progress we should give thought to the need for the education and training of technicians who work on jobs which require more limited technical competency than that of the fully trained engineer and scientist, and less manipulative training than is required of the skilled mechanic. These jobs usually involve the carrying out of experimental or production procedures which have been planned by the fully trained engineer and scientist. Workers on these jobs most frequently fall into the category of laboratory or technical assistants, or production supervisors. While the job of the technician is not new to industry, its importance has increased greatly during the developmental period of mass production to the point where emphasis should now be given to what is herein described as vocational-technical training of less than college grade.[1]

This bulletin, produced during the war, was prophetic in nature and somewhat ahead of its time. However, the basic philosophy of technical education and the recommended techniques of organization and operation of technical education programs are as sound and valid today as they were when the report was written.

The report was examined and reviewed by a later committee appointed by the U. S. Commissioner of Education in 1945. This com-

[1] *Vocational-Technical Training for Industrial Occupations.* Report of the Consulting Committee on Vocational-Technical Training. Vocational Division Bulletin No. 228, Vocational-Technical Series No. 1. Washington, D. C.: Federal Security Agency, U. S. Office of Education, 1944, p. VI.

mittee was known as the Committee to Study Postwar Problems in Vocational Education. A report of the review made by this committee was published by the U. S. Office of Education late in 1945.[2] This first major publication concerning postwar problems in vocational education referred only incidentally to technical education, but much of the material contained in it was at that time and still is applicable to technical education. These two federal studies were among the first of an extensive country-wide series of studies of the needs of industry for trained personnel.

Directors and supervisors of vocational and technical education throughout the country found it necessary immediately following the close of the war in 1945 to restudy their programs and to readjust them to postwar educational needs. Among their major problems were these:

1. To determine the need of industries for technicians
2. To analyze the technical occupations and to organize proper training programs
3. To determine facilities needed for technical education

### *California State Department of Education Activities*

These problems were particularly acute in California because of the heavy load of war training that had been carried by this state. Suddenly it became necessary to shift the emphasis in vocational and technical education programs from training for wartime manpower needs to the training necessary to provide for the manpower needs of a peacetime society. In 1944-45, only 460 students in California were enrolled in technical education classes that were reimbursed from federal vocational education funds. In 1945-46, this number had increased to 565 students enrolled in 21 classes. Technical education in California seemed to be a small operation in 1946. However, educators throughout the state recognized its potentialities and believed that here was a growing field in which the public schools could and probably should render a needed service to their communities.

One of the early results of this interest and concern and probably the first state-wide attention in California to this new and vital area of occupational training is described in the preface to the bulletin *Vocational Education in the Junior College,* which was prepared by a committee (later known as the State Steering Committee on Vocational Education in the Junior College) representing the California State

[2] *Vocational Education in the Years Ahead.* A Report of a Committee to Study Postwar Problems in Vocational Education. Vocational Division Bulletin No. 234. General Series No. 7. Washington, D. C.: Federal Security Agency, U. S. Office of Education, 1945.

Junior College Association, the California Association of Adult Education Administrators, and the California State Department of Education.

In November, 1946, a group of educators attending a meeting of the California State Junior College Association laid plans to undertake a concerted state-wide attack on the problem of how to develop more effective programs of vocational education in the junior colleges. Through the co-operation of Dr. Basil Peterson, President of the Association; Dr. David Green, President, California Association of Adult Education Administrators; and Mr. Roy E. Simpson, Superintendent of Public Instruction, a State Steering Committee was formed to direct the work. During the past two years that committee stimulated much study, discussion, and other activity throughout the state concerning this major problem—four regional conferences were called, a series of workshops was held, the committee itself met twice at San Luis Obispo to discuss progress and to prepare interim reports and recommendations. These activities involved practically every junior college administrator in the state, personnel of the State Department of Education, and other lay and professional leaders in vocational education. It is from the thinking, experiences, and deliberations of these individuals and groups that this handbook has evolved.

The major purpose of the handbook is to present in a brief, informal manner, some of the elements in the philosophy and objectives of vocational education with special reference to the junior colleges, and some of the techniques of establishing and operating adequate vocational programs in those institutions. As used in this publication, the term "vocational education" is defined as *education for anticipated early employment or advancement in an occupation, including all aspects of technical education which are provided in programs offered by junior colleges.* Vocational-technical training is a significant part of this broad concept. It is further understood that vocational education includes both the general education and the specific occupational training needed by the worker.[3]

This publication became the handbook for junior colleges of the state in their planning of curriculums in the vocational-technical field. Much of the material in this handbook is as valid today as it was when it was written. The procedures and techniques recommended are being used widely in the planning and administration of technical programs in the junior college.

Following the preparation of the bulletin, the State Steering Committee on Vocational Education in the Junior College continued its attention to the study of the field, and at a meeting held in Bakersfield on November 16, 1949, appointed a subcommittee to give further and more concentrated study to technical education in the junior college. The membership of this subcommittee included junior college administrators and the chief of the Bureau of Industrial Education, who acted as chairman. The subcommittee met at Berkeley on July 14, 1950, and made the following recommendations:

[3] *Vocational Education in the Junior College.* A Handbook, prepared by a Committee Representing the California State Junior College Association, California Association of Adult Education Administrators, California State Department of Education. Sacramento: California State Department of Education, February, 1949, p. v.

1. That a workshop be conducted prior to the next meeting of the entire Committee on Vocational Education in the Junior College.
2. That instructors of junior colleges who are or have been teaching so-called technical courses would be invited to participate in this workshop.
3. That this committee would meet over a two or three day period depending upon the progress of their assignment.
4. That the assignment given to members of the workshop will be:
   a. To identify technical education and its place in the junior college program
   b. To describe as many technical courses as possible, listing subjects taken and equipment, floor space, and type of laboratory or shop needed
   c. To give a brief description of each course in order that it might be clearly understood by anyone desiring to establish such a course.

As a result of the recommendations listed above, a workshop was conducted in Los Angeles on October 12-14, 1950, to carry out its assigned responsibilities. Progress reports were made to the State Committee on Vocational Education in the Junior College in November, 1950. This committee recommended that the reports be amplified. As a result, a second workshop was held in Los Angeles in May, 1952. Help was given in this endeavor by a class in curriculum problems in technical education during the summer session of 1952 at the University of California, Los Angeles. The project was completed and the final report published by the California State Department of Education in January, 1953, entitled "Technical Education in California Junior Colleges—a Study of Problems and Procedures."[4] This bulletin was so popular that the supply soon became exhausted. Because of the widespread interest that had developed in technical education and the rapidly increasing need for training in this field, three different committees rewrote and revised the publication under the new title "Technical Education for Industry—Suggestions for Meeting the Need for Technical Education Programs in California Junior Colleges."[5] This publication is now in wide use as a handbook among the junior colleges in California.

[4] "Technical Education in California Junior Colleges—A Study of Problems and Procedures." A Report to the Committee on Vocational Education in the Junior College by the Sub-Committee on Technical Education, on material developed in two workshops, held in California State Building, October 12-14, 1950, and May 8 & 9, 1952. Sacramento: Bureau of Industrial Education, California State Department of Education, January, 1953, p. v.

[5] "Technical Education for Industry—Suggestions for Meeting the Need for Technical Education Programs in California Junior Colleges." A Revision of "Technical Education in California Junior Colleges" published in 1953, which is a Report to the Committee on Vocational Education in the Junior College by the Sub-Committee on Technical Education. Sacramento: California State Department of Education, 1957.

In 1956, the Bureau of Industrial Education of the State Department of Education started making plans for a further study of technical education. Funds were included in the 1957-58 budget to cover the cost of such a study. In November, 1957, the project was started with the addition to the Bureau staff for a two-year period of a special supervisor of technical education to devote full time to the study.

### *General Objectives*

The broad, general purposes of this project were (1) to study the requirements of industry and public service in California for trained employees in the occupations usually classed as technical, and (2) to examine the contributions now being made by the junior colleges of the state in the field of training students for employment in these technical occupations.

In the report of the study, an attempt is made to develop a philosophy of technical education, together with some guidelines for use in implementing that philosophy. Because of the limitations of time and budget, the study was limited almost entirely to the training for employment in industry and public service, although it is recognized that there are numerous technical occupations outside the area of industry for which the junior colleges are, or will be, training students. Many of the problems, procedures, and techniques inherent in technical training for industry are also present in areas outside of industry. Many of the observations, conclusions, and recommendations made as a result of the study will be applicable to most technical training programs. It is recognized that the terms "engineering technician," "technician," and "industrial technician" are not necessarily synonymous. Many occupations requiring highly developed technical ability and extensive training are not engineering associated but are tied in directly to phases of industry such as production, maintenance, and sales or service, or are a part of administration or supervision. Although engineering in its many branches is by far the largest area of employment for technicians, this study also gives attention to other phases of industrial technology.

### *Specific Objectives*

After the general objectives for study were determined, a list of many specific objectives considered to be important and suitable for study was prepared. From this list, the following specific objectives were chosen as being the most important, comprehensive, and suitable for study. In the choice of this list, consideration was given to time limitations of the study.

1. To study the requirements of industry for qualified employees in the occupations classed as technical.
2. To assist the junior colleges in the state in providing adequate training for men and women who hope to enter, or who already are employed in, such occupations.
3. To find out what technicians do and what their background and preparation have been.
4. To describe groups or types of technicians on the basis of what they do.
5. To develop a philosophy of technical education.
6. To discover critical problems in the field of technical education.
7. To discover those curriculums now being used successfully in the training of technicians.
8. To determine the desirable training and experience for instructors of technical courses.
9. To set up guidelines to be considered in establishing and operating a technical program or in evaluating a technical program already in operation.

Several activities frequently carried forward in projects of this sort were not undertaken. For example, a determination of the number of technicians employed or needed in the several technical occupational fields was not made for the reason that several national, state, and local studies in this field have been made. These will be referred to later in this report. A questionnaire inquiry regarding the enrollment and curriculums in technical education programs was not made because several good, recent studies of this type are available. These will be commented upon in a later section.

A new definition of the "technician" is not attempted. One reason is that fairly adequate descriptions of, or statements about, the technician have been developed by the U. S. Office of Education and others. These statements seem appropriate and sufficient during this time when the whole field of the technologies is in a state of development and growth. Some of these statements are quoted in a later section of this report and will be referred to again.

***Procedures Used in Conduct of the Study***

Among the activities and procedures that were found to be necessary in the conduct of the study were the following:

1. Review of studies of employment in technical occupations conducted by federal, state, and local agencies; perusal of many current reports on the activities of technicians in various types of employment.

2. Consultations with industrial personnel directors regarding what technicians do and what they need to know.
3. Extensive reading in the literature of the field to determine further the needs for technicians in the various branches of engineering and industry.
4. Visitations in 41 California junior colleges and 8 technical institutes and technical high schools in eastern states to discover curriculums being used successfully in the training of technicians.
5. Analysis of all technical curriculums being offered in California junior colleges in order to discover basic patterns and concepts that could be useful in the construction of new technical curriculums.
6. Organizing and conducting 35 separate small conferences of educators concerning various phases of the study.
7. Co-operation and participation in the planning of the Los Angeles Workshop on Technical Education, January 15-16, 1958, and in the planning, organization, production, and reporting of the Northern California Workshop on Technical Education, San Francisco, May 15-16, 1958.
8. Preparation of an interim report of progress of the study because of widespread early interest in the study.
9. Evaluation of ideas and suggestions made by many junior college presidents, deans, co-ordinators, and state, county, and local co-ordinators and supervisors of vocational and technical education who reviewed, examined, and criticized the tentative draft of the report.

## CHAPTER II

# THE NEED FOR TECHNICAL TRAINING

The serious and growing shortage of adequately trained technicians for engineering and industry that exists in California and the United States has been contributed to by many factors. Among those factors having the greatest effect on this shortage have been the many changes and the phenomenal expansion of industry, the many new applications of scientific development, the growing recognition of the technician as a very important person in the manpower team in industry, and the serious lack of adequate training facilities for technicians.

### *Change and Growth in Industry*

The United States is in the midst of a second industrial revolution. During the first industrial revolution in the latter part of the nineteenth century, change took place at a fairly slow pace compared to the explosive growth and expansion in industry and technology during the last 15 to 20 years. Scientific research and development during the war years of the 1940's provided tremendous acceleration to the movement and made available for civilian use many materials, processes, and ideas that had been unknown or for which general applications had not been developed. Electronics especially, plastics and synthetics of many sorts, the transistor, great advances in the science of metallography—these and many others have contributed to this second revolution in industry, transportation, and communication. The effects of these new developments are being felt throughout the entire world.

The design, development, manufacture, and maintenance of military aircraft, with all of the highly complex and technologically advanced components and accessories, probably have contributed more to the new industrial revolution than have any other branches of industry. In addition, many new technologies have been created by such new developments as rocketry, with its space flight, guided missiles, new fuels, telemetry and instrumentation, computers, and new metals with amazing characteristics; and by controllable atomic energy, with its many possibilities as a source of power.

California's problems of adjustment to this new field are similar to those in many other states, but in many communities they are more intense and more varied than in others. The westward movement of industries that design, fabricate and assemble the many intricate and

complex components of the finished and fully equipped military aircraft, missiles, atomic reactors, and space ships has been so great in the last 10 years that hundreds of new job titles have been created in California industries, some of them being on the List of Critical Occupations of the U. S. Department of Labor. In addition, many new research and development firms and manufacturing concerns have been born in the West and have flourished and grown into whole new industries requiring, in many cases, technicians whose skills and abilities had never been needed previously. Some of the largest aircraft and missile companies with worldwide reputations originated in California. Among these are Aerojet, Douglas, and Lockheed.

*Migration of Industry.* The modern migration of industry, varying in extent from a single manufacturing plant to an entire industrial operation, has had a terrific impact both upon the communities from which it moves and upon the new localities to which it migrates. Business, the schools, and the local governments in both locations have been violently disturbed and disorganized by such migration. For some of the single-industry towns in New England whose industries have moved to the South, such a sudden uprooting of the industry and the population has proved to be a blessing in disguise. As a result, civic-minded citizens, chambers of commerce, and municipal officials have gone to work and have brought a variety of new manufacturing activities into their communities. Thus, these towns are no longer dependent on a single industry for the livelihood of their citizens.

The birth and growth of a new plant in a town places new demands on the schools, usually for a different type of training. This is especially true in a community that has been in an agricultural or rural area. Many manufacturers of component parts of aircraft locate their plants not in the large cities but in suburban towns where employees can live at home without fighting traffic through metropolitan areas. Other reasons for this choice of suburban locations are the dispersal of defense industries, more space at lower cost, and frequently a better choice of employees. This group of satellite industries often creates demands for school facilities not previously needed.

Many completely new residential communities have sprung up almost overnight near the towns and cities in which the many industries that employ technicians are located. Schools, churches, parks, community centers, and playgrounds are needed in these newly created residential communities to accommodate workers and their families. There is frequent need among members of families living in these communities for

the vocational and technical education needed to obtain employment and to advance in technical occupations. Even in communities that have not been affected by the growth and change so prevalent in the vicinity of large industrial concentrations, the normal growth and modernization of the activities of a town call for new skills and knowledge that must be acquired on the job or in school.

Many illustrations may be found, especially in California, of communities or areas in which severe adjustments have had to be made because of either the development of new industries or of changes in occupations of large numbers of their citizens. San Jose, Pasadena, Whittier, Santa Maria, Antelope Valley, Sacramento, and Richmond are excellent examples of communities in which sudden changes have been necessary because of employment upheavals.

*Women in Industry.* In recent years, women have been employed in technical positions in industry and public service in rapidly increasing numbers. This increase has several causes, including a greater willingness of industry to employ women, growing family need for increased income, job performance of women during and after World War II, the change in the nature of factory employment, and improved working conditions.

Increased numbers of women in technical occupations are found quite largely in drafting positions, in positions as industrial laboratory technicians and as chemical technicians, and in positions in electronics research and testing. Openings for women are found most frequently among industries producing dyes and textiles, cosmetics, perfumes, and foods. Junior colleges in areas in which employment is available for women have a challenge to provide training for them.

### *Industry's Need for Technicians*

As a result of the dynamic change and growth that are taking place in industry, a critical shortage of trained technicians has developed. As early as 1950, Harold P. Rodes, in a report of a study of the needs for technical training in California, reported a general opinion among the 440 industrial concerns and governmental agencies replying to a questionnaire that a substantial increase of technical positions was expected.[1] He found that it had become the practice among industrial employers during the recent years of spectacular growth to recruit graduate engineers and assign them to jobs that could have been done

[1] Harold P. Rodes, "A Report on a Survey of the Needs of California Industries and Governmental Agencies for Personnel with Training of Technical Institute Type." Presented at joint session of Junior College and Technical Institute Division, Annual Meeting of the American Society for Engineering Education, University of Washington, Seattle, Washington, June 22, 1950 (mimeographed).

more effectively by technicians who had been trained in a two-year technical institute or junior college. Rodes's study reported that nearly half the organizations who replied admitted that they were using engineering graduates in positions that did not require professional engineering training. This practice has been an important contributing cause of the nationwide shortage of engineers in most industries.

Although engineers have more years of schooling than are required for a technician, they do not receive all of the specific training necessary to do the technician's job as it would be done by an individual specifically trained for such a job. As a result of this practice, employers are often highly dissatisfied with their work. Another result of such practices is that engineers who are capable of work on a higher level but who are assigned to tasks requiring less than professional skills and knowledge soon become unhappy and frustrated. These practices are also difficult to justify from a realistic, dollars-and-cents point of view because of the resulting inefficient utilization of trained personnel.

In an address presented at the annual meeting of the American Society for Engineering Education in 1958, G. Ross Henninger, Director, National Survey of Technical Institute Education, American Society for Engineering Education, stated:

> In fact, one of the most productive ways to increase our effective supply of engineering-scientific professional manpower is through the integrated development and utilization of persons qualified to be Engineering Technicians. We must have the courage to turn over to the engineering technician all segments of yesterday's engineering and science which have become today's technologies. And we must recognize that these are very large segments. By doing this methodically and determinedly, we would correspondingly release the time and energies of our qualified engineering-scientific manpower. These, then, could extend and expand their competence and creative abilities in application to the frontier problems of today's science and tomorrow's engineering. This would conserve manpower because only two years of curricular work are required to develop an engineering technician in contrast with the requirement of four or more years to develop the engineer or scientist. Further, we thus take into account that somewhat intangible, but very important, factor of the personal and community value of having a person in a job which is in keeping with his interests and aptitudes.[2]

In 1957, the President's Committee for the Development of Scientists and Engineers reported that the greatest obstacle in the progress of the interstate highway program of the Bureau of Public Roads was the lack of technicians. A shortage of 46,000 existed. In many sections of the country, no technician training is now offered. One of the prin-

[2] G. Ross Henninger, "Thinking Ahead in Engineering Education—The Place of the Engineering Technician." A Second Progress Report. Prepared for Presentation at the Annual Meeting of the American Society for Engineering Education. Berkeley: University of California, June 16, 1958, p. 9 (mimeographed).

cipal reasons for the limited peacetime uses of atomic energy is the lack of technicians.[3]

As the Armed Forces have become highly mechanized organizations, a new type of personnel with a different type of ability and training has become essential to them. Complex military equipment has no strategic value in battle without competent technicians to operate and maintain it. John Braymer, Manpower Utilization Specialist, Office of the Assistant Secretary of Defense, in a conference on the Education and Utilization of Scientists and Engineers, Los Angeles, February 18, 1958, said:

> At present, about 45% of all enlisted military jobs require technically skilled occupants. Typical assignments include electronic equipment operators and maintenance men, skilled mechanics and repairmen, the new missile men, fire control technicians, and many other specialists.[4]

A recent study by the Southern California Research Council entitled *Manpower Outlook for the Los Angeles Area in the 1960s* predicts that 179,000 additional professional and technical workers will be needed by 1970—a 181 per cent increase in 20 years.[5] This is the greatest percentage of expected increase in any class of occupations in the Los Angeles metropolitan area, the population of which was 6,000,000 in 1957.

Dale Hiestand, National Manpower Council, Columbia University, has said: "The shortage of engineers is created primarily by a shortage of technicians."[6]

In an address before the California Conference on Science and Mathematics Education in the Public Schools held in Sacramento, California, on February 24-25, 1958, Kermit Mohn, Office of the Assistant Secretary of Defense, in speaking of the need for specially trained civilian personnel in the Armed Forces, said:

> We are on the threshold of a technological revolution in which each new scientific breakthrough generates additional requirements for personnel in order to exploit all applications of the basic scientific knowledge. The National Science Foundation has predicted that twice the present number of scientists and engineers will be needed by 1970.

---

[3] *National Leadership Development Conference, Trade and Industrial Education.* Conference Report August 12-23, 1957. Circular No. 519. Washington, D. C.: U. S. Department of Health, Education, and Welfare, Office of Education, 1957, p. 29.

[4] *Proceedings of a Conference on the Education and Utilization of Scientists and Engineers, February 18-19, 1958.* Sponsored by the Los Angeles Chamber of Commerce in cooperation with Educational, Engineering, Governmental, Industrial and Professional Groups. Los Angeles: Chamber of Commerce, 1958, p. 15.

[5] *Manpower Outlook for the Los Angeles Area in the 1960s.* Report No. 5. Los Angeles: Southern California Research Council, 1957, p. 14.

[6] *National Leadership Development Conference, Trade and Industrial Education, op. cit.,* p. 13.

> Not only are there shortages of professional scientists and engineers, but supporting technical personnel, generally called technicians, are also in short supply.[7]

In referring to the requirements for specialized military personnel, Mr. Mohn made these statements:

> At the present time, about 45 per cent of all jobs for enlisted men are in highly technical areas . . . An additional 20 per cent are in other craft and service specialties—fields which are less technical in nature. Another 20 per cent are in administrative or clerical-type functions, including supply, communications, personnel, and general administrative jobs of all types. The remainder, or about 15 per cent, constitute the hard core of ground combat personnel in the Army and Marine Corps.[8]

A dramatic and valid indicator of the employment situation in the categories of craftsmen, technicians, and engineers was found early in 1959 in the want-ad section of one of the metropolitan newspapers in southern California, an area in which there is a large concentration of defense-connected research, development, and manufacture. A brief study of the extensive want-ad section in the Sunday, January 18, 1959, issue of the *Los Angeles Times* indicated a tremendous demand for men and women with technical training or experience to fill a large variety of jobs as technicians. In the *Times* on the date mentioned, about 260 column inches or nearly 22 column feet were devoted to advertising for technicians to fill existing positions. There were 125 separate want ads in this classification varying from individual half-inch ads to double-column display announcements as long as sixteen inches, all of them inserted by employers. Most of the 125 ads mentioned above included listings of many different types of positions, all of which were technical in nature. Therefore, the total number of technicians needed was much greater than the number of individual ads would indicate. The types of jobs listed varied from electronics technicians through technical writers, inspectors, designers, and laboratory technicians, to analysts and technical instructors. Most of the companies advertising for technicians were recruiting for both their central and branch plants located all over the southwest and western parts of the United States. In addition to these individual and company ads, employment agencies mentioned, in display advertising in the same issue of the *Times*, 120 groups of available technical positions.

The number of technicians sought in the one newspaper studied does not represent an isolated, unusual situation, but is representative of the continuous program of search for qualified persons to meet an ever-

[7] Kermit Mohn, "Needs of Our Armed Forces for Persons in Scientific and Technological Fields," *California Schools*, XXIX (June, 1958), 296.
[8] *Ibid.*, p. 292.

growing demand for technical personnel in the industries of the area. The implications of this situation for technical education in California junior colleges are obvious.

## Chapter III

# THE TECHNICIAN

Countless questions are being asked about the person employed as a technician. What does he do? Where do we find him? What kind of training does he need? What is his role in modern industry? Finding answers to these questions is one of the serious problems confronting both industry and education in the development of technical training. This problem has been complicated by the fact that during the recent period of tremendous industrial growth, many new jobs have developed and existing jobs have changed or grown tremendously in size and importance in a relatively few years.

### *What Does the Technician Do?*

In recent years, much misunderstanding has developed concerning the use of the terms "technician," "technical," and "technology." There seems to be no consistency among the positions referred to as technical. Industry, engineering, medicine and dentistry, education, public service, and other broad fields of endeavor use the word technician in connection with a variety of vastly different jobs. For example, individuals referred to as technicians may simply be draftsmen employed in jobs such as detailing for which sufficient skill may be developed in a vocational-industrial course in high school; or they may be estimators required to do complex calculating and estimating in a construction office; or they may be designers needing advanced technical skills and knowledge. A tool designer conceivably could be a technician or an engineer, depending upon the proportion of mechanical work and design theory required in his particular job. The so-called "troubleshooter" performs tasks varying from those of a good mechanic in certain employment to those of a highly skilled technician in a field such as electronics research and development.

Technicians may also be employed as superintendents, foremen, or inspectors. They are people who are trained in the technologies of their respective occupations but who usually are neither graduate professional engineers nor expert craftsmen, although they have competencies in both areas.

Engineering has been called a "method of thinking." By implication then, a technician who is part engineer or scientist by nature and training, is also a thinking member of the team. He must possess adequate "know why" as well as plenty of "know how."

The duties of hundreds of jobs or occupations combine in varying degrees the skills of the craftsman with the skills and knowledges of the professional worker or scientist. This wide band of overlapping duties and activities constitutes the technician's field.

### *How Has the Technician Been Defined?*

Educators, professional workers, and industrialists concerned with the technician and his training frequently have attempted to define the technician and to describe his work. Richard S. Nelson, Program Specialist, U. S. Department of Health, Education, and Welfare, in an address at the Pacific Regional Conference on Trade and Industrial Education, March 24-28, 1958, said:

> As for a definition of this much wanted individual, one goes as follows: "An individual who assists with technical details in a trade or profession. Uses tools, instruments, and special devices to design, illustrate, fabricate, maintain, operate, and test objects, materials, or equipment. Performs mathematical and scientific operations, reporting on and carrying out a prescribed action in relation to them; examines and evaluates plans, designs, and data; determines actions to be taken on the basis of analysis; assists in determining or interpreting work procedures and maintaining harmonious relations among workers.[1]

Another descriptive statement is the following:

> The term "technician" is used to describe a large and loosely defined group of occupations at many levels of skill and with a wide variety of training requirements. In general, technician jobs fall between those of the skilled craftsman and the professional engineer or scientist. The work is technical in nature but narrower in scope than that of the engineer or scientist and has a practical rather than a theoretical orientation. Frequently technician jobs require use of complex electronic and mechanical instruments, experimental laboratory apparatus, drafting instruments, tools, and machinery. Almost all technicians must be able to use engineering handbooks and computing devices such as the slide rule or calculating machines.
>
> Technicians are utilized in virtually every activity where know-how is required. One of their largest and best known areas of employment is research, development and design work.[2]

The U. S. Department of Labor, Bureau of Employment Security, in a recent tudy of technicians' jobs uses the following concept of the technician:

> TECHNICIAN (in support of engineers and scientists): A term applied to one who performs specific tasks which are functional parts of scientific or engineering activities requiring knowledge of fundamental theory. The work activities sometimes require highly developed manipulative skills, as in the use of instruments, tools and/or special devices.

---

[1] Richard S. Nelson, "Meeting Manpower Needs for Technicians." An address presented at the Pacific Regional Conference on Trade and Industrial Education, Portland, Oregon, March 24-28, 1958, p. 4.

[2] *Employment Outlook for Technicians.* A Report on Technicians Who Work with Engineers and Physical Scientists. Prepared by the United States Department of Labor, Bureau of Labor Statistics. VA Pamphlet 22-1. Washington, D. C.: Veterans Administration, March, 1958, p. 1.

The range of work activities varies in complexity, but is usually in a specialized field of research, design, development and/or construction; in exploration, measurement, analysis and/or application of basic scientific concepts; and in control of production facilities and manpower. The performance of such work activities is based upon:

(1) Knowledge of the underlying scientific engineering and/or mathematical principles related to the specialized field of work and,

(2) The application of established scientific techniques and methods toward the solution of practical problems encountered in the field of specialization.

Technicians usaully become qualified through technical institute type of training, on-the-job and supplemental training, or a combination of both.[3]

The National Association of Manufacturers describes the role of the technician as follows:

The more revolutionary the discovery the more urgent becomes the need for people with special skills and training—people who are able to help translate scientific ideas and discoveries into useful products and services. This is the assignment of the technician. An industry needs an average of between five to seven technicians for every *one* professional engineer.

The technician is a special kind of person. As an engineering technician, he assists the engineer in planning and development work—as a draftsman, estimator, tester or research technologist. Even within a single factory, a technician may perform jobs ranging from simple testing projects to tasks requiring a high degree of creative and technical talent.

The technician holds a key spot between the engineer and the craftsman in industry, between theory and production. He uses drawing instruments, gauges, applied science, mathematics, diagnosis and analysis, common sense, initiative and good judgment in turning the ideas and theories of the engineer into mass-produced items. He collects data, makes computations, performs laboratory tests and turns in reports. He builds, supervises and controls the machines in our plants and offices. He's a key man at atomic installations, in aircraft and automobile factories, and also serves as a troubleshooter in electronics laboratories.[4]

The latest statement from official sources describing the "highly skilled technician" appears in a publication of the U. S. Office of Education that presents proposed regulations to govern the administration of Area Vocational Education Programs established by the National Defense Education Act of 1958. Section 102.108 of these proposed regulations states:

...The following characteristics of highly skilled technical occupations which require a scientific knowledge are suggested as basic minimum criteria:

(a) The occupation lies between that of the skilled crafts and the scientific professions.

(b) The occupation requires technical competency based upon specialized, intensive training in technical subjects involving the direct application of functional aspects of related sciences and mathematics.

Department of Labor, Bureau of Employment Security, January, 1958, pp. 2-3 (mimeographed).

[4] *Your Opportunities in Industry as a Technician.* An Educational Aid. New York: National Association of Manufacturers, January, 1957, pp. 7-8.

(c) The occupation is one in which most of the person's work is concerned with the application of technical knowledge and technical understanding in contrast with manipulative skill.

(d) The occupation is one for which adequate technical training can usually be provided in vocational technical programs on the secondary level, extension programs for out-of-school youth and adults on a full-time or part-time basis or terminal technical courses at the post-high school level of not more than two years in length.[5]

This statement of characteristics of highly technical occupations is particularly important at this time, since school districts operating programs of training for such occupations will be eligible for participation in the new Area Vocational Education Program.

It is extremely important that an early clarification and delineation be made of the scope and type of jobs or occupations that should be considered as properly belonging in the field of the technician. It is equally essential, if the present confusion is to be eliminated, that agreement be reached concerning terminology to be used.

### *What Are the Sources of Potential Technicians?*

Men and women who can qualify for positions as technicians are available from a very few sources. Regardless of the previous experience and education of these potential technicians, most of them require a certain amount of training before they attain competency in a new type of work.

An industrial concern, if it is diligent and lucky, has a source of potential technicians among those employees who have had more or less adequate and suitable experience and who are willing to take some appropriate courses in technical subjects. Some personnel directors have stated that most of their technical jobs have been filled by their own employees who have been up-graded through study of this sort. Another possible source of technicians is the large group of students enrolled in engineering colleges who leave school for various reasons before completing their full program and who, of necessity, must find employment. These young men usually have had a program of instruction directed not at the technical field but toward the engineering or scientific areas. The pre-engineering graduate of the junior college has also had largely an academic education with very meager training in manipulative skills. The training received by students who dropped out of engineering schools before graduating and by pre-engineering graduates of the junior college is rarely as effective and appropriate as is training

[5] "Area Vocational Education Programs." Administration of Title VIII, National Defense Education Act of 1958, P. L. 864, 85th Congress. Miscellaneous No. 3560. Washington, D. C.: Department of Health, Education and Welfare, Office of Education, Division of Vocational Education, 1958, p. 9 (mimeographed).

planned and directed toward the education of the technician. However, some of these men become acceptable technicians.

In California, the largest and most productive source of competent and adequately trained technicians for almost any of the many occupations in which their services are needed is the public junior college. The constantly expanding programs of technical education in these junior colleges and the increasing effectiveness of the training in these programs is supplying a steadily growing percentage of the technicians being employed by industry. These junior colleges have largely taken the place of the private technical institute found in the East and Middle West. However, these private technical institutes continue to be a large source of technicians in these sections of the country.

Women, as well as men, are being employed at an increasing rate in technical jobs. Mary S. Resh, Program Specialist in the Trade and Industrial Education Branch of the U. S. Office of Education, says:

> Industry is hiring an increasing number of women for jobs of a technical nature. Sold on the successful performance of their women technicians, employers want more and are looking to vocational (technical) education to recruit and train them as:
>
> Chemical technicians
> Draftsmen (or draftswomen)
> Electronics technicians
> Industrial technicians
> Optical technicians[6]

There are 22 million women workers in the United States, almost one-third of our total labor force. The percentage employed in technical occupations is constantly growing.

The National Association of Manufacturers has commented on women technicians as follows:

> Women are employed as technicians in laboratories attached to hospitals, medical schools, in private research firms and in chemical or pharmaceutical laboratories. Openings for the distaff side are found most frequently among industries producing dyes and textiles, cosmetics, perfumes, and foods. In these areas, women fill important positions as laboratory assistants, chemical aides, routine analysts, plant operators and production supervisors.[7]

### *What Kind of Training Does the Technician Need?*

The tremendous and rapid technological changes taking place in industry today are having great impact on education throughout the country. The large, complex, and rapidly growing area of technical employment makes it necessary that educators throughout the country, especially in industrialized sections, provide expanded training programs in the various technologies of industry.

---

[6] Mary S. Resh, "Les Girls—a New Chapter in the Manpower Story," *Charm* (March, 1957), 9.
[7] *Your Opportunities in Industry as a Technician, op. cit.*, p. 8.

Until recent years, training for industrial employment usually lay in two areas: the training of craftsmen and the professional training of engineers. The technician as he is known today was almost completely absent from the industrial team. Most educational institutions have followed their traditional, conservative curricular patterns and have been reluctant to meet the new educational needs for training for industrial employment, especially in the technical fields.

The scope of the work of the professional engineer educated in the early 1900's and the education he received at that time have changed greatly. The professional engineering education that he received was probably adequate and suitable for him at that time. However, for today's engineer, that education would be largely inadequate in scope and certainly meager in amount. The engineering technician of today requires almost as much training as the engineer received in the early 1900's.

Today, training for individuals referred to as technicians varies from that of a skilled craftsman to that of a person with professional schooling. Some courses described as "technical" in the junior college and technical institute catalogues are typical vocational trade and industrial courses with little advanced technical or scientific material included. Other courses, also listed as technical, may provide advanced training that goes far beyond that needed by the skilled craftsman. Such courses clearly fit into the technical classification. The term "technology" frequently appears in course titles such as Electrical Technology, Mechanical Technology, and Engine Technology, which may or may not refer to courses geared to the technician's needs.

The training needed for succesful employment as a technician in industry is normally about two years of full-time instruction beyond high school, although some technical jobs require perhaps only one year. A few highly technical jobs require some additional training.

The youth of California are particularly fortunate, since technical training is available in many of the 62 public junior colleges of the state. Many technical curriculums are open to the young man or woman who has the aptitudes for this exacting but rewarding group of occupations. As the training possibilities in the junior colleges in California become better known to high school students, to their parents, and to the personnel officers of industry, an increasing number of technicians will be employed from among junior college graduates.

Surveys in California and elsewhere show an increasing ratio of technicians to engineers. Thus it can be anticipated that as the number

of engineers in industry and public service increases, the number of supporting technicians will grow at an even greater rate. Today, well-trained technicians have no problem in finding suitable employment. One problem facing them is resisting offers of employment until they have completed the training program in which they are enrolled.

Salaries in the technical field vary greatly. In some cases, they may overlap the salary range of engineers. Community wage surveys of the U. S. Department of Labor, Bureau of Labor Statistics, reported in 1956 that draftsmen earned from $280 to $485 monthly, not including overtime. The pay rate for electronics technicians was from $2.00 to $3.00 an hour. Many junior colleges and technical institutes in 1957 reported starting salaries for graduate technicians of from $325 to $500 per month. Some experienced technicians receive salaries as high as $700 to $800 a month. There seems to be no ceiling on salaries for technicians.

The various technical curriculums will be discussed later in this report, and suggestions will be made as to desirable features of programs of technical training.

Mr. Walsh, U. S. Office of Education, states that the one sure characteristic of the future of technical education and technical educators is change. He develops this idea and its implications. This is a good article.

## Chapter IV

# THE DEVELOPMENT OF TECHNICAL EDUCATION IN THE UNITED STATES

Since the early period of our country's development, an effort has been made to establish educational institutions to provide students with training for useful employment. Many of the older educational institutions were patterned directly after those of Europe. One of the oldest of these, the mechanics institute, was borrowed from similar institutions in England in the early part of the nineteenth century.

### *Mechanics Institutes*

The mechanics institutes, designed to train mechanics and tradesmen, are among the oldest educational institutions set up in the United States for this purpose. Institutes of this type began to appear in America shortly after 1820, at first on a small scale. Notable among these were the Franklin Institute in Philadelphia, the Mechanics Institute in Cincinnati, and the Maryland Institute in Baltimore. Many of them grew and flourished for a number of years but eventually died out.

The mechanics institute movement was revived in the later years of the century following Germany's exhibits in the Centennial Exposition at Philadelphia in 1876, which placed great emphasis on the value of drafting as a basic tool in most industrial employment. This revival, too, soon lost impetus.

The failure of the mechanics institutes was largely due to lack of adequate funds, unsuitable meeting places, lack of usable subject matter, lack of adequate teaching material and devices, lack of competent instructors, unsound methods of instruction, and the Civil War. Another major reason for failure was the fact that the instruction was often isolated from the actual needs of industry, a problem that exists even today in many programs of industrial or technical education.

Although the mechanics institute movement died out, for the most part, the emphasis placed by such institutions on the acquisition of useful knowledge lived on as an American educational ideal. The mechanics institutes were in a very real sense the prophetic forerunners of our present industrial schools.[1]

[1] The material concerning the mechanics institutes is based largely on the following reference: Charles A. Prosser, *Evening Industrial Schools.* Chicago: American Technical Society, 1951, pp. 3-12.

***Technical Institutes***

Mechanics institutes in the United States were, for the most part, replaced by technical institutes. The idea of the technical institute was brought from Germany by Frederick Pratt about 1895 and infused into the program of Pratt Institute at about the time the Pratt family transferred their whole trade training program to New York City. They then developed a new program of technical institute training built around a new idea borrowed from the German "technikum," which Pratt had visited and studied a few years earlier.

The technical institutes in the United States, for the most part private institutions, have established themselves in a responsible position in American education. For many years, they carried on an important phase of education that was not being covered by any other type of educational institution. Today, they continue to provide technical education, especially in the Eastern and Middle Western sections of the United States.

Technical institutes have developed programs that vary in length from one to four years and that offer training leading to a baccalaureate degree for mechanics and artisans as well as for engineers. These programs also vary in content from a completely technical curriculum with no general or nontechnical subjects to a well-balanced and broader curriculum including both technical and general subjects. The majority now concentrate on the engineering fields.

The Curriculum Development Committee of the Technical Instruction Division of the American Society for Technical Education recently made a study of the composition of those technical curriculums accredited by the Engineers' Council for Professional Development (E.C.P.D.) in technical institutes in 1949 and in 1957.[2] For the most part, these curriculums were found in private technical institutes. The report indicated that an increased number of semester hours in the institutes was being devoted to courses related to the major technical field. Courses of this type included mathematics, drafting, and slide rule. This increased number of semester hours spent on courses related to the major technical field was frequently offset by a corresponding decrease in the hours allocated for the technical major. This reallocation of time probably reflected changes in the point of view of industry regarding qualifications for new employees in technical occupations.

The E.C.P.D. study also showed that a substantial increase was taking place in the percentage of semester hours of general education subjects

[2] "Curriculum Development Committee," *Technical Education News*, XVIII (Special Issue, 1958), 12.

required. In spite of this increase, the highest average percentage of time allotted to general education subjects reported in any one field of technical training in the 109 curriculums accredited by the E.C.P.D. in 35 schools in 1957 was 11.5 per cent, which was found in the mechanical technology curriculums. The percentage of semester hours in general education courses varied from the 11.5 per cent maximum in the mechanical technology curriculums to an average of only 2.38 per cent in aeronautics curriculums.

In 50 curriculums offered in 1954 but not accredited by E.C.P.D., in 11 public technical institutes affiliated with the University of the State of New York, an average of 13.8 per cent of the semester hour requirements of technical curriculums was found to be devoted to socio-humanistic subjects.[3]

***Public Post-High-School Educational Institutions***

In recent years and in growing numbers, publicly supported and operated post-high-school institutions have been sharing the task of providing technical education with the private technical institute. These public institutions may be known as community colleges, junior colleges, or technical institutes. Technical education curriculums in these institutions have been created because of the great need for technically and vocationally trained employees that has resulted from the recent rapid growth of industry. In some areas, technical education also is provided in the public technical high school.

*Institutions Outside of California.** Public technical institutions in the Eastern and Middle Western sections of the United States usually concentrate on technical curriculums and only incidentally, if at all, do they offer pre-engineering or liberal arts curriculums. Vocational trade programs are not classified as technical education in these public technical institutes. Most institutes of this type allocate a larger percentage of time within the technical curriculums to general or nontechnical subjects than do private technical institutes. On the average, about one-third of the student's total program is devoted to general or nontechnical subjects.

Public schools offering technical education programs are exerting leadership in an effort to increase the general education requirements in technical programs. A belief has developed that any student who

[3] Edward E. Booher, "Survey of General Education in Technical Institutes," *Technical Education News*, XIV (Special Issue, 1954), 6.

* The material in this section is, for the most part, based on the observations and reactions of the co-ordinator of the study reported in this bulletin, who during the course of this study, visited a representative sampling of public technical institutes in the East and Middle West. During this visit, classes, shops, and laboratories were visited; interviews were conducted with school administrators, supervisors, instructors, and students; and texts, curriculums, catalogs, and other publications of the schools were studied.

graduates from a technical program in a public technical institute or junior college should have a well-balanced educational experience regardless of what may be his major field of preparation.

Most public technical institutes select entering students carefully, using different methods but in each case choosing only the best from among those who apply. In most cases, only students with above-average ability can expect to succeed in completing the technical curriculums offered in these schools.

All schools visited during the course of the study had good or excellent laboratories and shops. School officials specifically stated that their technical programs did not attempt to develop skilled mechanics but were set up to provide students with the orientation and training they need to develop moderate skills in the use and functions of tools and machines as well as a working acquaintance with the materials and mechanisms used in the occupations for which the training was planned. The descriptions of courses and curriculums seemed to verify these claims.

In all curriculums studied, the place of mathematics, science, and English was found to be important. The mathematics was tailored to the occupational field, and usually no advanced courses were required beyond those that normally meet the needs of their major field. The theories and abstractions of academic college mathematics were included only in a minor degree. Emphasis was placed on the applications of mathematical processes both in the mathematics courses and in the technical courses and laboratories. Science courses were also closely related to the technical major involved.

Public technical institutes seemed to have no difficulty regarding placement of their graduates. Placements of from 80 to 90 per cent seemed general. The major problem in these schools was to keep the students in school until they finished their training. Industry seems anxious to employ them, fully trained or not. Want ads in papers published in communities served by these schools state: "Preference given to graduates of _____ school." This condition has grown up over years of successful placement until an enviable reputation has been established by the schools. On the other hand, there are few good follow-up programs in operation. Surveys are made only occasionally.

Most of the schools operate on a 30-hour week with as many as 20 hours of outside preparation required. The rate of absence was very low, and failures in schools with careful entrance selection procedures were few. The one school visited that used a "first-come-first-served" enrollment plan had a high failure rate in the first year.

Teachers were, for the most part, engineers or technicians with adequate and appropriate experience. Degrees were not always a requirement for employment. One large school operated an in-service teacher training program. Teacher load averaged from 20 to 25 hours per week with what seemed to be rather small classes.

Several of these schools had a higher salary schedule for teachers of technical subjects than for teachers of academic or nontechnical subjects. Salaries were determined on the basis of comparisons with salaries in industry. Teaching salaries had often been adjusted to compete with them. This practice had eliminated the serious problem of finding competent teachers in technical fields.

Public relations generally seemed good. There were adequate contacts with secondary schools and their counselors; with industry, through advisory committees; and with the general public, through many media.

The technical high schools visited during the course of this study were exclusively vocational and technical but at the same time included in their programs an amount of general education that was almost equivalent to that required for graduation from most nontechnical high schools. One school also offered a fully accredited program preparing students for admission to a college engineering program. This program was accepted by universities and colleges. Students graduating from two other technical high schools were eligible for admission to some engineering schools and colleges upon recommendation of the high school. The technical training programs in two high schools seemed to be on a very high level and the equal of many junior college programs. One reason for this was the high level of selection of entering students. Only superior, mature boys were accepted.

*Institutions in California.* Technical education in California is provided almost entirely in the public junior college. The educational objectives and the general philosophy of technical education of these institutions resemble those of the public technical institutes in other sections of the United States. However, public junior colleges in California usually offer a wider range of curriculums. With but two exceptions, the technical programs in California junior colleges are the smaller part of the total school program. (See Chapter V for a detailed discussion of curriculums in California junior colleges.)

There is plenty of evidence to indicate that some of the wide differences that formerly existed between the technical education programs of the public technical institutes in the East and the junior colleges in California are decreasing and that the technical programs in both types

of schools are becoming more similar. The public junior college in the West, without doubt, will continue to be a comprehensive type of institution in which terminal or occupation-centered technical education will be but one important part.

### *Technical Programs in Universities and Colleges*

Traditionally, four-year colleges and universities in the United States have felt that technical education that did not lead to a baccalaureate degree was not a part of their responsibilities. They have concentrated on the training of professional engineers and scientists, leaving the training of technicians to the technical institutes and junior colleges.

However, in recent years, a relatively small number of public and private colleges and a few universities have established on their campuses technical divisions in which approximately two years of terminal or occupational training of a technical institute type are provided for qualified high school graduates. At present, at least 15 colleges are offering such technical education. The list includes such well-known institutions as Pennsylvania State University, Temple University, the University of Houston, and the University of Dayton. Some of these programs started as off-campus, post-high-school, extended-day programs for working mechanics and technicians. As these programs grow and gained status, they were transferred to the campus and became divisions of the college or university organization. The courses offered in these technical divisions may or may not have transfer value as lower division courses. Others are strictly occupation centered and have little if any transfer value.

The curriculum patterns of these technical division programs of universities or colleges are approximately parallel to those of the technical institutes and junior colleges. They vary from a highly academic pattern to one containing considerable training of a practical nature. The percentage of semester units of general or nontechnical courses included in these curriculums also varies.

### *Technical Training Programs Carried on by Industry Working in Co-operation with Public Junior Colleges*

In addition to technical education programs offered exclusively in public and private schools, technical education programs are also offered by industry, itself, working in co-operation with the public schools. Such programs provide extensive retraining for industrial personnel in the form of in-service training. Many co-operative programs of this type have been set up in a short period of time and have helped to solve crippling manpower shortages. School personnel have been

called upon to give counsel and advice in planning, organizing, and conducting such training programs, and either junior college and university personnel or regular engineering or technical employees have served as instructors. Such programs are usually carried on in the training departments of the plants. In some cases, training programs have been set up on the campus of the co-operating school.

Students enrolled in programs of this type frequently receive regular college credit for the courses successfully completed. Some employers pay part or all of the cost of the employee's tuition and books. Numerous co-operative training programs of this type are now operating successfully and are decreasing in a constructive fashion some of the great shortages of trained technical personnel in many branches of industry.

An extremely important by-product of these school and industry-sponsored training programs has been the demonstration, both to the educational systems and the industrial communities, that such co-operatively planned and operated technical training programs are feasible and can be profitable and successful. Furthermore, they have demonstrated that this co-operative approach is far more successful and effective than are separate programs attempted by either the schools or industries alone.

One dramatic example of how a junior college met a challenge generated by the sudden growth of a new training need is found at San Jose City College. A number of new companies active in vacuum tube research and development and manufacture and production built or expanded their plants in or near San Jose, thereby setting up an increased concentration of employment possibilities in a highly technical field. Representatives of these companies approached officials of the San Jose City College regarding the establishment of a training program for technicians needed in this new industry in the community. The problem was studied by the junior college and its advisory committee. Committees from both the industry and the junior college went to work. The processes and procedures common to the work of the several companies were analyzed. Job descriptions were set up, and a training program worked out to develop technicians competent to work in this new local industry. It was found that few of the basic electronics courses already in operation at the junior college were appropriate and adequate and that much of the highly technical, related knowledge needed in vacuum tube research and development was outside the regular, established electronics curriculum at the college. Therefore, new courses were constructed; competent instructors from one or another of the new companies were made available. Special equipment and apparatus not

available from ordinary sources were loaned or given to the college. During the period of this preparation and study, which lasted two or three years, an extension program of appropriate lectures was set up and carried on by the college. At the end of this period of preparation, a new, full-time day program was put into operation. The advisory committee that had functioned during the period when the program was being established continued to give advice and counsel.

Thus, one co-operative industry-education project was developed and proved its ability to serve the immediate industrial and educational needs of a community.

## CHAPTER V

# THE STATUS OF TECHNICAL EDUCATION IN CALIFORNIA

Free, post-high-school technical education in organized curriculums leading to the Associate in Arts degree is offered in many public junior colleges in California. Only a few private technical institutes of the type found in the Eastern and Middle Western parts of the United States are in operation in California.

### *Analysis of Technical Education Curriculums in California Junior Colleges*

As part of the study of technical education reported in this bulletin, an analysis was made of the nature and scope of technical education curriculums in California junior colleges. This analysis was accomplished by studying the curriculums and the course descriptions in the current catalogs of the 62 junior colleges in California. The following steps were taken in making this analysis:

*Step No. 1.* Each curriculum and all descriptions of required courses included in the curriculums were examined for the purpose of determining those curriculums that could be identified as technical. Only those curriculums that met the requirements of the following criteria were considered to be technical for the purpose of this analysis:

a. The curriculum was listed as "technical" or "technology" in the catalog.
b. The curriculum was described as "terminal" or "occupational" in the catalog.
c. The curriculum led to the Associate in Arts degree in two years of full-time instruction.
d. The descriptions of the courses within the curriculum indicated that the curriculum was more scientific than manipulative in nature and stressed the "why" as well as the "how."
e. The curriculum prepared for occupations on a level between that of the skilled mechanic and that of the professional or administrative person.

Since the number of technicians in industry and public service includes the majority of all individuals in all technical employment, consideration was further limited to technical programs that prepare for employment in industry and public service, including research and de-

velopment, manufacturing, maintenance, operation, and construction. Two types of curriculums, even though referred to in the catalogs as "technical," were *not* included in this analysis: (1) those whose descriptions indicated that the content was predominantly manipulative training and included little or no technical content beyond that offered in the usual trade and industry program; and (2) those that were exactly parallel to the lower-division courses within a four-year college curriculum. Curriculums listed as technical in the fields of agriculture, medicine, dentistry, the graphic arts, business, and other fields outside of industry and public service were not included in this analysis, since the study was confined primarily to a consideration of training for employment in industry.

*Step No. 2.* Technical curriculums were assembled into groups according to general fields of instructions. (See Table 1.)

*Step No. 3.* Courses in each curriculum were classified under the following subdivisions:

a. Science courses (listed as basic science, or as physics, chemistry, etc.).
b. Courses in major field, including shop, laboratory, and class.

**Table 1**

**NUMBER AND KINDS OF TECHNICAL CURRICULUMS OFFERED IN 30 CALIFORNIA JUNIOR COLLEGES**

| Technical Curriculum Group | Number of Colleges Offering Technical Curriculums | Number of Technical Curriculums Offered | Per Cent of Total Number of Technical Curriculums Offered |
|---|---|---|---|
| Electronics Technology | 16 | 19 | 22.0 |
| Engineering Technology | 17 | 18 | 20.9 |
| Drafting Technology | 8 | 10 | 11.6 |
| Laboratory Technology | 5 | 5 | 5.8 |
| Mechanical and Industrial Technology | 5 | 5 | 5.8 |
| Civil Technology | 4 | 4 | 4.7 |
| Construction Technology | 3 | 4 | 4.7 |
| Radio and Television Technology | 3 | 4 | 4.7 |
| Refrigeration and Air Conditioning Technology | 3 | 3 | 3.5 |
| Tool Design | 2 | 3 | 3.5 |
| Aeronautical Technology | 2 | 2 | 2.3 |
| Chemistry Technology | 2 | 2 | 2.3 |
| Electrical Technology | 2 | 2 | 2.3 |
| Petroleum Technology | 2 | 2 | 2.3 |
| Paint Manufacturing Technology | 1 | 1 | 1.2 |
| Sanitation Technology | 1 | 1 | 1.2 |
| Transmission (Electrical) Technology | 1 | 1 | 1.2 |
| Total | | 86 | 100.00 |

c. Related technical courses, except basic and academic science.

d. General education courses (English, history, economics, etc.).

e. Free electives.

*Step No. 4.* The number of semester units in each course and in each subdivision was tabulated. The average number of units required and the range in number of semester units required in each subdivision of each of the 17 groups of curriculums were computed.

Information obtained by these procedures is presented in Tables 1 and 2. It was found that 86 technical curriculums were offered in 30 junior colleges. The remaining 32 junior colleges, which, according to the limitations established, had no technical programs, are almost all located in nonindustrial or in agricultural areas. Most of them are small junior colleges, and several are located in communities in which the majority of the young people expect to attend colleges or universities for the purpose of receiving an academic or professional education.

As shown in Table 1, there were 17 general curriculum groups. There were more curriculums in electronics technology than in any other group. The 19 curriculums of this kind had titles such as Electronics Technology (14), Electronics Research Technology (1), Industrial Electronics (2), Electronics Systems (1), and Computer Technology (1). These numerous electronics programs in California serve many industries in which electronic equipment is designed, developed, manufactured, assembled, or used. Most of the junior colleges offering these curriculums are located in communities near concentrations of aircraft manufacturing and missile industries.

There were 18 training programs in the engineering technology curriculum group, almost as many as in electronics. The engineering technology curriculums provided training for mechanical and electrical engineering assistants, engineering aides, and junior engineers. The drafting technology curriculum group, with 8 curriculums, occupied third place in the list of technical curriculums. This group included curriculums in design, mechanics, engineering, architecture, and estimating.

The data in Table 2 present the average number of semester units and range in number of units required in each of the 17 technical curriculum groups and show the average number of semester units of credit required in each of the subdivisions within the 17 technical curriculum groups. Table 2 reveals some extreme variations with respect to the number of semester hours required within the several subdivisions of the technical curriculums.

Catalogs of the junior colleges were not sufficiently uniform or standardized in the presentation of the patterns of curriculum organi-

zation and content to permit an exact classification of all technical education courses for the purposes of study and comparison. Many courses in these curriculums, therefore, could not be accurately classified as science, major, or related technical subjects. For example, drafting in one curriculum might properly be classified as a related technical course, while in another it would be considered as a part of the major field of study. Science courses were listed in some catalogs as science, that is as basic science, physics, or chemistry and were placed in the science subdivision in Table 2. Other science courses were labeled as related technical and were included in that subdivision. All mathematics courses were classified as related technical courses.

From Table 2, the following facts concerning the organization and content of the technical education programs offered in 30 of the California junior colleges can be seen.

1. Within the 86 curriculums studied, the average number of units required for completion of a curriculum was 64.7. The range was from 60 units to 71 units. Both of these extremes occurred in the electronics technology curriculum group, in which the average number of units required is 64.7. Because of the highly technical nature of these curriculums, it would be extremely difficult for most students to complete a program requiring an average of almost 18 units per semester and to graduate in the usual two years. However, only 3 of the 86 curriculums required 70 or more units for completion. Regarding this situation, *A Restudy of the Needs of California in Higher Education* makes the following recommendation:

   > ***It is therefore recommended that the junior colleges review their offerings and the regulations under which students may register for courses beyond 64 units, with the intention of limiting the total amount of work which students may take to that which is clearly within the province of these institutions.***[1]

2. From the columns in Table 2 headed "range," it can be seen that there was an extremely wide variation in the number of units required within subdivisions in most curriculum groups. These programs of course are, or should be, governed by the requirements of the particular occupation for which each program trains the student. However, even within any particular group of curriculums, the variations in requirements among similar individual curriculums are so great that junior colleges should restudy cur-

[1] T. C. Holy, H. H. Semans, and T. R. McConnell, *A Restudy of the Needs of California in Higher Education*. Prepared for the Liaison Committee of the Regents of the University of California and the California State Board of Education. Sacramento: California State Department of Education, 1955, p. 56.

## Table 2

## SEMESTER UNITS OF CREDIT IN TECHNICAL CURRICULUM GROUPS ACCORDING TO SUBDIVISION

| Technical Curriculum Group | Total Units Required for Completion of Curriculums | | Units Required, by Subdivision | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | | | Science Courses | | Courses in Major Field | | Related Technical Courses | | General Education Courses | | Free Electives | |
| | Average | Range | Average | Range | Average | Range | Average | Range | Average | Range | Average | Range |
| Aeronautical Technology | 61.5 | 60–63 | 1.5 | 0–3 | 10.5 | 9–12 | 32.5 | 29–36 | 15.0 | 14–16 | 2.0 | 0–4 |
| Chemistry Technology | 62.0 | 60–63 | 17.0 | 8–26 | 14.5 | 5–24 | 6.0 | 5–7 | 21.5 | 20–23 | 3.0 | 0–6 |
| Civil Technology | 63.8 | 62–65 | 5.0 | 0–8 | 18.8 | 5–30 | 19.5 | 12–36 | 13.0 | 7–18 | 7.5 | 2–12 |
| Construction Technology | 62.7 | 62–65 | 4.2 | 3–5 | 18.8 | 8–30 | 19.5 | 15–25 | 15.5 | 7–22 | 4.7 | 3–7 |
| Drafting Technology | 62.9 | 61–66 | 0.9 | 0–4 | 23.9 | 14–34 | 18.8 | 8–28 | 15.7 | 7–24 | 3.6 | 0–8 |
| Electrical Technology | 66.5 | 64–69 | 3.0 | 3–3 | 22.0 | 14–30 | 25.0 | 22–28 | 15.5 | 7–24 | 1.0 | 0–2 |
| Electronics Technology | 64.7 | 60–71 | 2.7 | 0–13 | 28.3 | 12–40 | 14.5 | 8–31 | 15.5 | 7–21 | 3.7 | 0–12 |
| Engineering Technology | 64.1 | 60–69 | 7.4 | 0–22 | 15.6 | 4–30 | 17.9 | 2–36 | 18.9 | 13–27 | 4.3 | 0–15 |
| Laboratory Technology | 64.4 | 60–67 | 7.6 | 0–33 | 24.2 | 9–36 | 11.8 | 2–22 | 17.0 | 14–23 | 3.8 | 2–9 |
| Mechanical and Industrial Technology | 65.8 | 62–69 | 5.6 | 0–11 | 27.6 | 12–33 | 13.2 | 7–20 | 15.4 | 7–19 | 4.0 | 0–8 |
| Petroleum Technology | 68.0 | 67–69 | 10.0 | 9–11 | 24.5 | 21–28 | 11.0 | 11–11 | 20.5 | 17–24 | 2.0 | 0–4 |
| Paint Manufacturing Technology | 62.0 | --- | 7.0 | --- | 4.0 | --- | 11.0 | --- | 17.0 | --- | 23.0 | --- |
| Radio and Television Technology | 67.5 | 61–70 | 1.0 | 0–4 | 22.3 | 17–32 | 23.8 | 14–28 | 19.2 | 13–24 | 1.2 | 0–5 |
| Refrigeration and Air Conditioning Technology | 66.7 | 65–68 | 2.3 | 0–4 | 23.8 | 9–32 | 19.7 | 3–34 | 18.6 | 7–25 | 2.3 | 0–4 |
| Sanitation Technology | 65.0 | --- | 7.0 | --- | 23.0 | --- | 11.0 | --- | 14.0 | --- | 10.0 | --- |
| Transmission (Electrical) Technology | 69.0 | --- | 0.0 | --- | 21.0 | --- | 26.0 | --- | 22.0 | --- | 0.0 | --- |
| Tool Design | 64.0 | 62–66 | 2.0 | 0–6 | 22.7 | 21–25 | 16.6 | 16–17 | 19.0 | 17–20 | 3.7 | 2–5 |
| All Curriculums | 64.7 | 60–71 | 4.9 | 0–33 | 20.3 | 4–40 | 17.5 | 2–36 | 17.3 | 7–27 | 4.7 | 0–23 |

riculum content. The data on ranges as shown in Table 2 are among the most striking results of this analysis and even of the entire study. A close study of these data is recommended.

3. There was a range in number of science courses of from 0 to 33 units. The data used in compiling Table 2 showed that in some curriculums, science courses were not listed as separate subjects. However, in some curriculums in which no courses were labeled as science, it is probable that sufficient applied science was included in courses labeled as related technical. The other extreme, 33 units, as might be expected, was in a laboratory technology (physical science) curriculum.
4. There was a wide range of from 4 to 40 units in required courses in the major field. The curriculum requiring 40 units was the electronics curriculum mentioned in point number 1 above, which required a total of 71 units for completion.
5. The average total number of units in the major courses, related technical courses, and science courses, that is, in all of the technical courses in each curriculum, was 42.5 units, or 66.4 per cent of the average units in all curriculums. The range of required units in these three subdivisions combined was 22 to 57 units.

The data presented in Table 2 indicate that the average number of units required in each of the major subdivisions in all of the technical curriculums is approximately as follows:

| | |
|---|---|
| Courses in Major Field | 20 units |
| Related Courses | 17.5 " |
| Science Courses | 5 " |
| General Education Courses | 17 " |
| Free Electives | 4.5 " |
| Total | 64 units |

It should not be inferred that the above averages present an ideal technical curriculum. On the average, the ratio of unit requirements in technical courses to those in general education courses in technical curriculums is approximately two to one. However, as has been indicated, individual technical curriculums vary widely from the average. A curriculum containing courses in the proportions indicated by the averages presented above is not equally appropriate to meet the wide variety of needs in the many phases of technical training. Some guideline must be developed for use in the planning and construction of all technical curriculums. Further study should be given to the proper

balance in technical curriculums, and a policy should be developed concerning curriculum content and balance that is generally acceptable to junior colleges and to employers in industry.

***Other Technical Education Curriculum Patterns***

In addition to the curriculum patterns of technical education programs described in the preceding section, two other types of curriculum patterns are commonly used to provide technical education in the junior colleges of California. They are (1) lower-division engineering curriculums that are offered in four-year colleges and universities; and (2) the so-called double-purpose technical curriculum.

When the courses in the technical education curriculums in the junior college correspond to those of lower-division engineering curriculums, credit for such courses is transferable with full credit to four-year engineering schools. However, such curriculums fail to provide the occupation-centered training needed for most technicians. In this connection, G. Ross Henninger, President, Ohio Mechanics Institute, in his report of progress of the National Survey of Technical Institute Education has this to say:

> At the risk of over-simplification, I may say that the person who finishes the first two years of an engineering curriculum as presently cataloged by most of the E.C.P.D.-accredited engineering colleges and universities is NOT adequately prepared for productive employment, either as an engineering technician or as an engineer. Such a person has too much of too little to qualify as an engineering technician, because he is only at the threshold of his engineering professional-technical subject matter.
>
> This leads to another point of major importance and all-too-much confusion: This is the misguided idea that the zone of Engineering Technician is the natural "dumping-ground" for those who "can't make the grade" in engineering. As a matter of fact, most of those unfortunate misfits who "cannot make the grade" in engineering as now handled educationally or professionally would be just as miserable misfits in the field of Engineering Technician.[2]

Some junior colleges attempt to operate what is sometimes called a "double-purpose" technical curriculum. Such a curriculum is intended to provide adequate training for technical employment for some students and at the same time to serve as a lower-division curriculum for students planning to transfer to a four-year college or university. Such a curriculum can be justified only in the smallest schools in which it might seem impossible to schedule both pre-engineering and separate technical programs. Even in such an extreme situation, some expert and clever curriculum building and course modification would be required if such a combination program were to resemble even remotely both an acceptable pre-engineering transfer curriculum and,

[2] Henninger, *op. cit.*, pp. 6-7.

at the same time, provide adequate training of a terminal or occupational nature in the technical field. It would, of necessity, be based on too many compromises to be effective. However, if such a double-purpose curriculm must be used, it should be planned through the cooperative efforts of the dean of admissions of a four-year college and an advisory committee from the industrial groups most likely to employ the students upon completion of the curriculum. There seems to be little, if any, justification for a double-purpose technical program in a large junior college.

Such a curriculum might be compared to the multi-purpose tool. A good mechanic in any occupation rarely carries such a tool in his toolbox. He uses single-purpose tools for each operation or process of his trade. The combination tool is almost never as effective nor as easy to use as is the single-purpose tool that has been used and proved over the years or newly designed to meet new mechanical needs. Such is the case with the double-purpose curriculum.

### *Relationships Between Junior Colleges and State Colleges and the University of California*

The functions and fields of activity of the junior college, the state college, and the University have been set forth many times. *California Education Code* Section 23601 specifies the following functions of the state college:

> The primary function of the state colleges is the training of teachers. State colleges also may offer courses appropriate for a general or liberal education and for responsible citizenship; offer vocational training in such fields as business, industry, public services, homemaking and social service; and offer the pre-professional courses needed by students who plan to transfer to universities for advanced professional study.

*California Education Code* Section 7802 specifies the following functions of the junior college:

> The course of study for two-year junior colleges shall be designed to fit the needs of pupils of the thirteenth and fourteenth grades and may include courses of instruction designed to prepare for admission to the upper division of higher institutions of learning and such other courses of instruction designed to prepare persons for agricultural, commercial, homemaking, industrial and other vocations, and such courses of instruction as may be deemed necessary to provide for the civic and liberal education of citizens of the community.

The following interpretation has been made of these functions of the junior college in *A Restudy of the Needs of California in Higher Education:*

> Lower-division transfer education; vocational and technical education, usually designated as "terminal"; community service and adult education.[3]

[3] Holy, Semans, and McConnell, *op. cit.*, p. 53.

In an effort to avoid overlapping and possible duplication of educational programs that might result from such a broad authorization, the junior colleges, state colleges, and the University of California have agreed upon a policy to insure that the state colleges offer training at a level that lies between that supplied by the two-year programs of the junior colleges and that supplied by the professional schools of the University. This policy of differentiation of functions is well stated in the following quotation from the Strayer Report of 1948:

> Technical programs have in California long been regarded as the province of the two-year junior college, while professional training is the province of the university. It is the level between the technical training of the junior college and the professional and research departments of the university toward which the occupational curricula of the state colleges are pointed.[4]

This principle of differentiation of function among the three types of public higher education institutions was appraised as to validity and feasibility by a Restudy Committee approved by the Legislature in 1953. This Restudy Committee expressed the conviction that, broadly interpreted, the principle of differentiation was sound. They made the following recommendation:

> It is recommended, therefore, that the junior college continue to take particular responsibility for technical curriculums, the state colleges for occupational curriculums, and the University of California for graduate and professional education and research.[5]

Another and completely different area of relations between the junior colleges and the state colleges and University is that of transfer of credits earned in technical courses in junior colleges to the state colleges and to the University. At present, no uniform policy governs the transfer of credits. A junior college student with a high scholastic standing who transfers to either a state college or the University has little difficulty in having standard lower-division pre-professional credits accepted in an appropriate department. However, credits received for a technical course in the junior college may or may not be transferable to engineering departments in state colleges or the University.

A real problem arises when junior colleges build their technical curriculums around courses with an occupation-centered objective rather than as lower-division, pre-engineering courses. These technical courses often are not accepted at full value by the University. However, there

---

[4] *A Report of a Survey of the Needs of California in Higher Education* (The Strayer Committee Report). Prepared by the Committee on the Conduct of the Study, appointed by the Liaison Committee of the Regents of the University of California, and the State Board of Education. March 1, 1948, p. 27.

[5] Holy, Semans, and McConnell, *op. cit.*, p. 89.

is growing willingness in many of the state colleges to accept these credits in appropriate departments. Many junior colleges have worked out mutually agreeable arrangements with one or more state colleges to accept technical course credits for individual students who want to continue their training in a state college and who have demonstrated sufficient ability to succeed in advanced work.

At least two co-operative projects are already operating in California in which a junior college and a state college have collaborated in setting up four-year curriculums in management-technical fields. In both of these programs, the lower-division courses in the junior college are technical in nature, while the upper-division courses in the state college continue the technical training into the management fields. Graduates of these programs qualify for the Bachelor of Science degree. Employment objectives are "front office" positions that can be held after suitable orientation jobs in the company's operations. Positions of this type are in activities such as estimating, selling, and public relations.

This new type of co-operative effort by the two types of institutions seems to have excellent possibilities and should be studied by junior college administrators who are considering future expansion of their technical programs.

A somewhat similar co-operative technical institute-university program is in operation in Wentworth Institute and the College of Education of Northeastern University in Boston, Massachusetts. This program is designed to train men for industrial arts teaching in secondary schools, technical institutes, and junior colleges. The first two years in Wentworth are spent in one of the regular curriculums. Those who qualify may then be admitted to advanced standing in the College of Education at Northeastern University for further professional study and a period of practice teaching. This plan also suggests possibilities for similar co-operative programs in California junior colleges and state colleges.

Co-operative planning between junior colleges and state colleges seems to offer excellent opportunities for an integrated technician-engineer, or technician-management, training program. It deserves and should receive study and analysis.

### *The Function and Responsibility of the Junior College in Technical Education*

The junior colleges of California are in a particularly strategic position to carry much of the training load in the field of technical education. Because the California junior colleges are governed locally, they

have the ability to respond quickly to the needs of youth and business and industry in their respective communities or adjacent areas. This circumstance carries a parallel obligation to set up and operate training programs that meet those needs. However, because of this local autonomy during the early period of rapid growth and development of technical education, there was no general pattern that could be used as a guide in developing curriculums, almost no occupation-centered textbooks on a technical level, and some lack of understanding among junior college instructors, supervisors, and administrators regarding the real purposes and objectives in this new field of education. As a result, each junior college planned its own program, frequently in co-operation with local advisory committees from industry.

More recently, some common patterns and basic philosophies have begun to appear among the various junior colleges as the result of study, conferences, and workshops conducted by local groups, the California Association of Junior Colleges assisted by the State Department of Education, and interested people from business and industry.

In a recent address, Howard A. Campion, former Associate Superintendent of the Los Angeles City Schools, stated:

> The American junior college is truly American. It is probably the only one of our educational institutions that has sprung entirely from American needs and American ideals. Our other institutions have been borrowed in large part from foreign countries and experiments overseas, but the junior college is an institution that is close to the people on the local level. It is under the control of local citizens. It can respond readily to changing demands of the community. It can furnish a functional type of education unhampered by tradition or pattern. Here is the place to develop a program that will meet the needs of this great area lying between the skilled craftsman and the professional engineer. Here is an opportunity to provide education beyond the high school which will be immediately functional in the life of those people who enter occupations not requiring an extensive college or university program.[6]

The functions of the junior colleges in California seem to be well delineated and universally accepted among educators who are concerned in this area. These functions are stated as follows in *A Restudy of the Needs of California in Higher Education:*

1. Technical-vocational education
2. General education
3. Lower-division pre-transfer education
4. Community service education of post-high-school grade, within the range agreed upon for junior colleges
5. Guidance[7]

---

[6] Howard A. Campion, "The Nature and General Purposes of Technical Education." Address before American Association of School Administrators, Regional Conference, San Francisco, March 10, 1958.

[7] Holy, Semans, and McConnell, *op. cit.*, p. 53.

Junior college educators, generally, agree that the functions of their institution are occupational education (terminal), general education, college education (lower division), guidance, and community service.[8]

The National Committee for the Development of Scientists and Engineers, a group established by President Eisenhower on April 3, 1956, in a report prepared in 1957, pointed out a national need for programs of technical curriculums in a post-high-school educational system:

> The Committee determined early in its course that the United States needs a midway point in the educational system between high school and college, and proper recognition for two-year training in higher education. Activities on this problem include greater recognition for two-year technical training; uniform recognition of technical institutes; strengthening of technical institute curricula; encouragement for junior and community colleges.[9]

Phebe Ward, in her book *Terminal Education in the Junior College,* states the responsibilities of the junior college as follows:

> The junior college, particularly the public junior college, is dependent upon the community for its students; training and guidance information; employment of students and graduates; and co-operation, support, and counsel. In turn, the community depends upon the junior college to offer such services as training, guidance, placement, follow-up, and continuation training.
>
> In order to fulfill this obligation to the community, every junior college should consider the implications for terminal education created by these economic and social factors. Paramount among these is the fact that the junior college should assume responsibility for organizing terminal programs—determining the type of program that should be developed and recognizing the educational processes that are involved in administering terminal education.
>
> *Responsibilities for Terminal Education.* With respect to the responsibilities for initiating terminal programs, the social and economic factors all seem to indicate one basic premise—namely, a growing number of students for whom the junior college and similar institutions must provide. As a result of the increased emphasis upon education that was effected by the war, additional numbers of adults will be seeking opportunities for classroom instruction in their local communities. Together with high-school graduates who continue their education, these adults will constitute a growing number for whom the junior college must assume a major share of the responsibility....
>
> The challenge that falls to the junior college is this one of meeting the needs of a large new body of students who will enroll as a result of the economic pressure for limited employment opportunity. And these students need beyond all else also a concept of civic virtue and individual morality to enable them to occupy useful places in society.[10]

The previous viewpoints have been emphasized by the position taken by the California Junior College Association that it is the responsibility

---

[8] *Ibid.*, p. 52.

[9] *The National Committee for the Development of Scientists and Engineers.* A brochure. Washington, D. C.: National Committee for the Development of Scientists and Engineers, 1957, p. 4.

[10] Phebe Ward, *Terminal Education in the Junior College.* New York and London: Harper & Brothers Publishers, 1947, pp. 15-17.

of the junior college in California to educate technicians for industry. They feel that no other institution in the West can do this job and that California junior colleges must expand existing offerings and provide new centers for technical training. This training must be at the technical-institute level.

The junior college in California is in a unique position. It provides a segment of our educational system that is probably the most logical and potentially effective for meeting the growing need for technical education. Junior colleges must accept this responsibility and must strengthen and expand their technical programs. No other segment is situated so strategically to carry on this relatively new training as is the junior college.

The anticipated large increase in the number of students who will be seeking admittance to junior colleges will, without doubt, produce increasing pressures on junior college administrators to create more and more academic curriculums that are less expensive and that can accommodate a larger enrollment than can technical and other occupational curriculums that require larger facilities and more expensive shops and laboratories. These pressures to offer the easier program must be resisted if the junior college is to maintain its unique position and if it is to meet the constantly increasing demand for the occupational training that the junior college can and should provide.

Junior colleges can exercise productive leadership and at the same time partially help to solve their own problems of space and facilities by study, in co-operation with contributing high schools, of the desirability and feasibility of beginning technical training in the high school and completing the program in the junior college. For example, if a high school has a good vocational trade and industry program, or at least a well-equipped shop, it could provide some of the required manipulative instruction in one or more technical curriculums during the eleventh and twelfth years in the high school for selected students who plan to enter a technical program in the junior college. If, on the other hand, the junior college has suitable facilities for shop instruction but the contributing high school does not, then the students who planned to enter the technical program of the junior college could be permitted to take their required shop training in the junior college shop before graduating from high school. Suitable arrangements could be made regarding attendance, transportation (if necessary), and credits. A few junior colleges in California already are using such arrangements. It is quite possible that other junior colleges could also develop similar programs.

Another type of co-operative program that could be developed profitably in the contributing high school might be called a pre-technical curriculum. Such a co-operative program could include suitable mathematics, science, drafting, or English courses selected from regular or special courses. These subjects could be planned to provide students with training needed to develop the competencies required in most technical programs offered by the junior college. In any such plan, careful co-ordination of high school and junior college activities in counseling, programming, and curriculum organization is most essential if the program is to be productive and successful.

## Chapter VI

# GUIDELINES FOR PLANNING, OPERATING, AND EVALUATING A TECHNICAL EDUCATION PROGRAM

In the preceding chapters of this report, many of the problems that exist in the development and operation of technical education programs have been identified and discussed. In some programs, the problems seem to exist because of the lack of a well-established, consistent philosophy, particularly a lack of clearly defined and realistic objectives. For the most part, these problems have developed as a result of the fact that the public junior colleges have been forced to establish technical education programs at a rapid pace with few guidelines from well-established, successful programs and with little state-wide co-ordination.

The material presented in this chapter was developed over a period of months in conferences and conversations with junior college educators and with city, county, and state supervisors of technical and vocational education, and is, therefore, based on the ideas and points of view of many people. It includes guidelines that should be useful in planning, operating, and evaluating a technical education program and in solving many of the pressing problems involved. These guidelines are basic and may be used, with slight modification, for almost any program of technical education.

Listed below are 12 basic questions covering fundamental points that should be given careful attention before a new technical education program is inaugurated:

1. To what extent would community wealth or welfare be increased through the vocational [technical] program?
2. To what extent would the introduction of this training contribute to the welfare of the adult population?
3. To what extent would the introduction of training for such jobs as analyst, computer, estimator, designer, draftsman, inspector, etc., contribute to the welfare of youth?
4. To what extent could a counseling and placement service be provided for a program of technical education?
5. To what extent could employer and employee organizations within the occupations be expected to co-operate?

6. To what extent do scientific research and invention or technological development indicate a continuance of [a technical] occupation in its present form?
7. To what extent would employment opportunities be available to those who would be trained in a technical education program?
8. To what extent would the proposed training program duplicate existing programs provided by other agencies?
9. To what extent are qualified potential trainees available in the local community?
10. To what extent is it possible to recruit efficient instructors for this program?
11. To what extent can the proper environment for preparing for employment in such jobs as nuclear power operator, production planner, production processor, tool planner, template technician, etc., be made available?
12. To what extent would the introduction of a technical education program contribute to the welfare of the employers?[1]

### *Determining the Needs for Training*

Many factors must be given consideration by junior college administrators who contemplate the establishment of a technical education program in their institutions. They must have extensive and dependable information and data upon which to base any decision concerning the establishment of a program of technical education. First, a determination must be made concerning whether or not such a training program is needed in the community. If it is found that there is a need for such a program, a determination must then be made of the nature and extent of such need. This information is usually obtained by means of a survey, which is one of the most important activities in the planning of a technical education program in a junior college. The most satisfactory results are usually obtained if proven techniques and routines are followed.

Included in Appendix A is an outline of steps that should be taken in conducting a community occupational survey. This material is adaptable to surveys of an entire community or of a single industry and should serve as an excellent guide for those conducting a survey. Sample survey forms appear in Appendix B.

Junior college administrators contemplating the establishment of a technical education program should give consideration to the provisions

[1] This material was adapted from the following publication: Howard A. Campion, *Criteria for the Establishment of New Vocational Courses.* Los Angeles: Howard A. Campion, 1941. (Pamphlet)

of the National Defense Education Act of 1958, particularly to the provisions contained in Titles V and VIII. Under provisions of this Act, junior colleges contemplating the establishment of technical education programs may be eligible for financial assistance in addition to that available under the federal Smith-Hughes and George-Barden vocational education acts. However, such assistance is available only for those educational programs that train for occupations definitely connected to national defense.*

***Developing the Curriculum***

After the preliminary survey of the technical training needs of the community or of a particular industry has been made, the findings of the survey are studied by junior college administrators and their superintendent or board of education. Decisions are then made concerning technical curriculums that should be established.

Training for competence in an occupation or group of occupations should be the prime consideration in the construction and operation of a technical curriculum. Such a curriculum can best be constructed in co-operation with representatives of the industry for which the training program is being designed. The nature, content, methods of instruction, and purposes of a technical curriculum should rarely, if ever, follow exactly any lower-division transfer curriculum in the same field. The following comments on the technical curriculum were made in *A Restudy of the Needs of California in Higher Education.*

> The faculties of some [junior] colleges desire that vocational curriculums serve purposes not entirely compatible with preparation for employment at the end of the training period. For example, they may plan two-year terminal-vocational curriculums in terms of the amount of transfer credit which may be given by a four-year institution rather than strictly in terms of occupational requirements.
>
> The desire to have their programs win status for transfer purposes and to avoid undue loss of time to students who wish to transfer to upper-division work is understandable. Unless this tendency is resisted, however, vocational-terminal curriculums may become so oriented toward upper-division requirements that they no longer serve effectively for entry into the occupational field and therefore cease to serve the best interests of the majority of students who do not transfer.
>
> Therefore, terminal-vocational curriculums should be designed primarily as ends rather than as means to further education. If some students have the ability and resources to continue their education in a four-year institution after completing a two-year vocational curriculum, it is to be hoped that four-year institutions will have flexible enough requirements for admission to ad-

* Detailed information concerning the basic provisions of the National Defense Education Act and how to qualify for assistance under this act are available in the following publication of the California State Department of Education: "Area Vocational Education Programs." Title VIII, National Defense Education Act of 1958. P.L. 864, 85th Congress. Basic Provisions. Sacramento: California State Department of Education, November, 1958.

vanced standing to take into consideration the type and quality of the student's performance in junior college programs.

*Consequently, it is recommended that in order to insure the integrity of technical-vocational curriculums, they should be designed and conducted as ends in themselves and not as preparation for possible transfer to upper-division or professional programs.*[2]

Because employment practices in technical occupations vary so widely, and because technical education programs must be built around such occupations, many variations and complexities exist in the operation of technical education programs. Some junior colleges have found it expedient to adapt already-operating professional engineering or scientific curriculums on the one hand, or the long-established curriculum patterns of the vocational, trade and industrial education programs on the other hand, or both, for use in training technicians.

The amount and type of actual shop practice included in a particular curriculum is an important item and must be given careful consideration when a new curriculum is planned. All technicians, as well as engineers, need to have at least a working acquaintance with the hand and machine tools, materials, processes, and operations of their occupations. They need not possess the degree of skill required of the highly skilled mechanic but need a considerable amount of manipulative skill accompanied by some knowledge of the related technical information of the trade, since sooner or later it will be required in their work on the job. Technical training curriculums should include training that will develop the manipulative skill appropriate for the occupation for which the training is being given.

Curricular adaptations to meet the needs of technical education, in many cases, have not yet reached the point of greatest effectiveness. Some technical curriculums follow too closely the academic professional line with inadequate mechanical skill training. The tendency in this case is to teach the traditional academic courses in mathematics and science rather than the technical type of course that is closely related to the occupation or group of occupations toward which the students' training is directed. On the other hand, if training in the shop skills dominates the technical curriculum to an unrealistic degree, insufficient time remains for training in the theoretical phases of the occupational requirements. Mathematics should be taught in such a way that it becomes a functioning and productive skill and an important tool in the students' chosen occupations rather than a study in logic and a form of mental exercise. In the teaching of science, too, emphasis should be placed on its practical application. A sizable number of junior colleges

[2] Holy, Semans, and McConnell, *op. cit.*, p. 57.

are achieving a proper and effective relationship between theoretical and shop training in the technical curriculum.

A well-balanced technical training program must include a proper amount of general, or nontechnical, courses. It is a legal requirement in California that the following general education courses and requirements be included in all public junior college curriculums leading to the Associate in Arts degree:

| *Course* | *Credit Hours Required* |
|---|---|
| Constitution of the United States and American History | 3 credit hours |
| Community and Personal Hygiene | 2 credit hours |
| Physical Education | 2 credit hours |
| Oral and Written English | Determined by local districts.[3] |

Most California junior college curriculums include at least twice this minimum requirement of general education. A philosophy generally accepted by junior college administrators in California holds that technical education and general education are not only compatible but are actually complementary and form an integral and complete junior college educational program for technical students.

Albert Einstein has been quoted as saying:

> It is not enough to teach a man a specialty. Through it he may become a kind of a useful machine, but not a harmoniously developed personality. It is essential that the student acquire an understanding of and a lively feeling for values. He must acquire a vivid sense of the beautiful and the morally good. Otherwise he—with his specialized knowledge—more closely resembles a well-trained dog than a harmoniously developed person. He must learn to understand the motives of human beings, their illusions and their sufferings in order to acquire a proper relationship to individual fellowmen and to the community. This is what I have in mind when I recommend the "humanities" as important, not just dry specialized knowledge in the fields of history and philosophy.[4]

*Determining Needed Mathematics and Science.* At present, a study is being conducted at the School of Education of the University of California, Berkeley, in co-operation with the Bureau of Industrial Education of the California State Department of Education to determine the extent and nature of mathematics and science needed by technicians in selected electronics and chemical industries in the San Francisco Bay Area of California. The data for the report have been secured directly from persons in these two industries who are either technicians or supervisors of technicians. The results of the study should be of considerable value to junior college deans of instruction

[3] *California Administrative Code*, Title 5. Education, Section 102.
[4] John S. Allen, "General Education in Technical Institutes," *Technical Education News*, XIII (Special Issue, 1954), 12.

and co-ordinators of technical education in developing or evaluating programs of technical education. The tentative title of the report of the study, which will be published in the fall of 1959, is "Critical Mathematics and Science Requirements for Electronics and Chemical Technicians."

Included in a recent study of six selected groups of industrial technicians was a study of the amount of knowledge of mathematics and science that they used in their work. Opinions concerning such knowledge were sought from 45 competent individuals in 15 industrial firms. These opinions were recorded on the following scale of from 0 to 4:

| | |
|---|---|
| None—0 | A great deal—3 |
| Little—1 | Thorough—4 |
| Some—2 | |

Tables 3 and 4 record the opinions of the individuals questioned. For example, in Table 3, the figure 3.1 in the "Beginning Algebra" line in the "Engineering Technician" group indicates that "a great deal" of beginning algebra, on the average, is used by the engineering technicians in the industrial concerns surveyed. Tables 3 and 4 are adapted from tables found in the report of this study.[5]

Listed below in brief form are important items that should be considered in the development of a technical curriculum.

1. Junior colleges should assume leadership in initiating and developing technical programs.
2. The curriculum must be developed with advice, counsel, and support of industry.
3. The curriculum must be related closely to the requirements for skills, knowledges, and understanding of the occupation or group of occupations.
4. The curriculum must be sensitive to occupational changes.
5. The training need not be confined to those fields of employment found in the local community.
6. The curriculum should not be too specialized.
7. Neither the traditional lower-division, university curriculum nor the usual vocational-industrial curriculum is adequate in content or objective.
8. Lower-division engineering courses do not constitute adequate preparation for the technician.

## Table 3

### RELATIVE AMOUNT OF KNOWLEDGE OF MATHEMATICS USED BY SELECTED GROUPS OF TECHNICIANS AS INDICATED BY THE OPINIONS OF COMPETENT PERSONS IN INDUSTRY *

| Areas of Mathematics | Total Group | Engineering Technicians | Mechanical Technicians | Maintenance Technicians | Production Technicians | Laboratory Technicians | Electronic Technicians |
|---|---|---|---|---|---|---|---|
| Beginning algebra | 2.5 | 3.1 | 2.4 | 2.8 | 1.1 | 2.3 | 3.2 |
| Plane geometry | 1.9 | 2.9 | 2.4 | 1.2 | 1.6 | 1.4 | 1.8 |
| Advanced algebra | 1.4 | 2.1 | 1.7 | 1.6 | 0.66 | 0.66 | 1.0 |
| Solid geometry | 1.3 | 2.3 | 2.0 | 0.57 | 0.66 | 0.4 | 0.83 |
| Trigonometry | 1.9 | 2.9 | 2.4 | 1.6 | 1.0 | 1.5 | 1.7 |
| Descriptive geometry | 0.85 | 1.4 | 1.42 | 0.25 | 0.33 | 1.0 | 0.2 |
| Accounting (cost) | 0.61 | 1.0 | 1.14 | 0.38 | 0.43 | 0.33 | 0.0 |
| Calculus | 0.41 | 0.5 | 0.71 | 0.38 | 0.43 | 0.17 | 0.2 |

## Table 4

### RELATIVE AMOUNT OF KNOWLEDGE OF SCIENCE USED BY SELECTED GROUPS OF TECHNICIANS AS INDICATED BY THE OPINIONS OF COMPETENT PERSONS IN INDUSTRY *

| Areas of Science | Total Group | Engineering Technicians | Mechanical Technicians | Maintenance Technicians | Production Technicians | Laboratory Technicians | Electronic Technicians |
|---|---|---|---|---|---|---|---|
| Mechanics | 2.4 | 3.0 | 2.7 | 2.9 | 2.0 | 1.8 | 1.2 |
| Heat | 1.4 | 1.8 | 1.4 | 2.4 | 0.29 | 1.2 | 1.0 |
| Electricity and magnetism | 1.9 | 0.7 | 0.86 | 2.9 | 1.4 | 1.8 | 4.0 |
| Sound and light | 1.1 | 0.38 | 0.2 | 2.0 | 0.5 | 0.67 | 2.3 |
| Hydraulics | 1.6 | 2.3 | 1.3 | 2.0 | 0.86 | 1.5 | 1.0 |
| Chemistry | 0.86 | 0.78 | 0.43 | 0.88 | 0.57 | 2.0 | 0.67 |
| Metallurgy | 1.1 | 1.33 | 1.17 | 1.38 | 0.57 | 1.5 | 0.5 |
| Strength of materials | 1.2 | 2.1 | 1.4 | 1.6 | 0.43 | 1.2 | 0.0 |

* The following scale was used in recording the opinions of those interviewed concerning the relative degree of knowledge used: none—0, little—1, some—2, a great deal—3, and thorough—4.

9. Nature, content, methods of instruction, and purposes of a technical curriculum should seldom, if ever, follow lower-division pre-professional curriculum patterns.
10. The curriculum should be primarily occupation centered. Transfer value should be of secondary importance.
11. Technical curriculums should be designed and conducted as ends in themselves. Transfer of course credits is not a major objective.
12. Curriculum must prepare student for employment at graduation.
13. Double-purpose curriculum (engineering and technical) is a compromise, usually not completely adequate in either field.
14. Course titles and descriptions must be realistic.
15. Balance among technical, nontechnical, class, laboratory, and shop is essential.
16. Adequate general, or nontechnical, instruction is necessary.
17. Traditional academic organization of mathematics and science courses is not realistic in technical education.
18. Depth and scope of mathematics and science must be tailored to occupation needs.
19. Mathematics and science courses must be related to the occupation, must have a problem-solving objective, and should place less emphasis on abstract concepts than in the traditional academic course.
20. The first-semester curriculum might be basic and suitable in training for a group of occupations and for counseling purposes. Later semester curriculums could be more specific in objective to meet the needs of a particular occupation.
21. Achievement levels required and content should be based on the job requirements rather than upon specified number of units and courses.
22. State and federal assistance for programs of training for occupations connected with national defense are now much more easily available. New policy is now in operation.
23. Strict adherence to one-hour classes is not necessarily desirable.
24. Strict adherence to the traditional Plan A or Plan B in the California Plan for Trade and Industrial Education (block programs) is no longer required in junior colleges.

Lynn A. Emerson, Special Consultant, Trade and Industrial Education, U. S. Office of Education, has made the following points regarding technical curriculums:

a. There is no blueprint of a package pattern.
b. We will have to think more of women in this program.
c. Much research is needed.
d. Develop patterns of groupings of job requirements.
e. Know more of the impacts of automation.
f. Be concerned about creative education—creative ability.
g. Do not neglect other areas, such as accounting, etc.
h. Study curriculums—some may be standardized or need to be adapted to local conditions.
i. Develop good attitudes in students.
j. Give more attention to laboratory work.
k. Give attention to our sequences in our evening programs.
l. Strive for the development of technical skills—ability to apply technical information.
m. Train for versatility.[6]

*Sample Technical Education Curriculums.* The following four technical curriculums are being operated successfully in a California junior college. Each has characteristics that are usually considered to be inherent in any successful program of technical training. There are many more such well-planned and successful technical curriculums of which these four are representative. Each is occupation centered; each trains for a group of jobs; and each has a good balance among shop, laboratory, related technical instruction, and general or nontechnical education. Each meets the requirements for the Associate in Arts degree.

INDUSTRIAL DRAFTING AND DESIGN

| *13th Year* | *Semester Hours* 1st Semester | 2nd Semester | *14th Year* | *Semester Hours* 1st Semester | 2nd Semester |

| Electives (restricted) | | 3 | | | |
| | 15½ | 15½ | | 16½ | 16½ |

Total units—64

It is felt that several units of shop training could be added to the industrial drafting and design curriculum included above. The major in the curriculum for engineering assistants is sufficiently broad to insure students of adequate training for a group of jobs. The oil field technology curriculum included contains a balance of shop, related instruction, laboratory, and general education courses. The civil technology curriculum is flexible. It is adaptable to several occupations and is planned primarily as training for employment in highway and bridge design and construction.

***Selecting Instructors***

Among the several factors that determine the success or failure of a technical education program, probably the most critical and important is the choice of the instructor. The incorrect choice of instructor for a new program can result in disaster. An administrator who is wise will refuse to start a new technical program until the right instructor can be secured, even if the other conditions are favorable for the inauguration of a new curriculum.

Instructors in technical education programs should have a combination of adequate training and experience in their particular specialty. They should have a baccalaureate degree in engineering, science, or mathematics. Most administrators feel that appropriate industrial employment is an absolute requirement in the preparation of a technical education instructor who expects to teach either the major subjects or the related mathematics or science in the curriculum. An academically trained instructor without employment experience in industry as a technician or in a closely related position would find it difficult to relate his knowledge to the industrial occupation for which his students would be preparing. Training for the teaching profession, in addition to other academic training and practical industrial experience, is highly desirable for an instructor in a technical education program.

Sources of potential instructors in technical education programs include the following:

1. Experienced technicians employed in industry. (This is a particularly good source of part-time teachers of extension classes.)
2. Engineering graduates.
3. Teachers in private technical institutes.
4. Retired military personnel.
5. Experienced graduates of the technical education program in the employing institution.

Instructors should be chosen who will be acceptable to those industries in which students trained in the program will be employed. A thorough review should be made of the candidate's academic transcripts and other training records, of his employment records, and of his references. The results of school district examinations, if any, must be considered and personal interviews held.

***Planning the Facilities***

As agreement is reached concerning the organization and content of technical education programs, consideration must be given to the facilities needed for their operation. A study must be made of the space requirements of classrooms, laboratories, and shops and of the equipment needed to carry out the instructional program properly. If these facilities are not already available, they must be provided. Instructors should assist in designing and planning facilities needed for courses that they will be teaching.

The following facts should be considered by a junior college staff in planning for facilities for a technical education program.

1. Although instruction in a technical education program is largely a combination of classroom and laboratory activities, the shop or manipulative part of the training is basic and important. The type of shop ordinarily used by a high school vocational education program is adequate for most technical curriculums. The technician need not be an expert craftsman even though he must have a good working knowledge of the tools, materials, and mechanical processes involved in his occuption.
2. Laboratories need not have the same equipment as the usual college physics or chemistry laboratory except in cases in which the purpose of the program is to train laboratory technicians. Even in such programs, simplification is permissible and proper. Laboratory instruction in technical programs is based on the application of the particular science to industrial processes. The laboratory should be equipped for this function rather than for the traditional academic approach to college science courses.
3. Classrooms and lecture rooms usually provided in well-designed college or high school buildings are quite suitable and adequate for the technical program and may need little if any modification.
4. In the planning of all facilities, the objectives of the curriculum must be kept in mind.
5. It must also be remembered that many, or all, of the facilities used in a technical education program will also be used in academic,

engineering, and general education programs. Therefore, facilities must be planned for such programs as well as for the technical education program.

6. Industry, through advisory committees, frequently will make available unusual, special, or expensive equipment or apparatus for demonstration or test use in shops or laboratories.

The following table shows briefly the differences in facilities needed for training in the skilled trades and for technicians. It appears in the report of the National Conference on Vocational-Technical Education held in Washington, D. C., in 1957.[7]

**Table 5**

**DIFFERENCES IN FACILITIES NEEDED FOR SKILLED TRADES TRAINING AND FOR TECHNICAL TRAINING**

| FACILITY | SKILLED TRADES TRAINING | TECHNICAL TRAINING |
|---|---|---|
| Shops | Typical of industry—to provide experience on real and practical jobs. | Uses craft shops in wide variety. |
| Laboratories | Limited use. | Well-equipped for extensive use for testing, research, and experiments. |
| Classrooms | Usual type, with standard equipment for demonstrations and individual participation. | Usual type, with standard equipment for demonstrations and individual participation. More library and reference material. |
| Drawing or drafting rooms | Typical of those in use. | More adequately equipped for more extensive use. |
| Special work areas | Limited use. | Extensive use. |
| Equipment | Extensive, with work stations for each student, matching conditions in industry. | Less extensive, with more variety for experiments and tests. |
| Tools and supplies | Complete set for each student to be used each day. | Less complete, but with wider variety for checking, testing, and experimentation. |

This report does not include specific recommendations concerning shop and laboratory design, layout, equipment, and other facilities. Because of the great variety of training needs of technical education, detailed recommendations would be of very limited value here. Included in the list of selected references are publications that should prove to be

[7] *Meeting Manpower Needs for Technicians.* Report of a National Conference on Vocational-Technical Education. Washington, D. C., May 13-17, 1957. Washington, D. C.: U. S. Department of Health, Education, and Welfare, Office of Education, Trade and Industrial Education Branch, 1957, p. 35.

helpful in planning or evaluating the facilities for a technical education program.

### *Counseling and Selecting Students*

In the operation of any technical education program, high priority should be given to the development of an adequate counseling and guidance program. Such a program is essential if those students who have the ability and aptitude for success as technicians are to be enrolled in technical education programs. The importance of careful selection procedures cannot be overestimated. It has been said that:

> In starting any new program [in technical education], the success of the first graduates is critical. This success cannot be guaranteed by education alone, without regard to the qualifications of the students admitted to the programs.[8]

A counseling and guidance program should provide the following:

1. A vocational information service, which collects occupational information;
2. A personal data collecting service, which obtains information about the individual;
3. A counseling service, in which the individual is helped to study himself, his occupational opportunities, and his occupational goals and plans;
4. A placement service, which helps the individual get into contact with job opportunities, and work out a job-getting program;
5. A follow-up and research service, designed both to evaluate the program and to help the individual make job adjustments.[9]

The early discovery of the talents, interests, and aptitudes of possible future technicians, engineers, and scientists is extremely important. A large aircraft company that is making a serious attempt to assure a steady supply of the trained people it needs recently made a survey of a random sample of its technical staff to discover which were the critical years in a man's education during which he might be led to a career in engineering. On the basis of the responses of 185 people, the following information was obtained:

1. 41.6 per cent indicated that junior high school (grades 7 through 9) was the period during which the student's interests were directed toward the fields of science and engineering; 29.2 per cent indicated that this took place in senior high school (grades 10-12).
2. 27.5 per cent said that books had been the greatest influence in leading them to pursue a science curriculum; 15.6 per cent said that friends had influenced them in this direction.
3. 46.4 per cent of those responding recommended junior high school as the level at which special attention should be given to persuad-

---

[8] "Technical Education for Industry—Suggestions for Meeting the Need of Technical Education Programs in California Junior Colleges," *op. cit.*, p. 15.
[9] National Manpower Council, *A Policy for Skilled Manpower*. New York: Columbia University Press, 1954, p. 277.

ing students to pursue preparation for an engineering career; 17.8 per cent recommended senior high school for such activity.[10]

Following is a list of suggestions and ideas for consideration in the counseling and selection of students. This list may be used as guidelines for establishing standards for evaluating selection procedures used in a technical education program:

1. Students with exceptional ability should be found and motivated.
2. Unselected entering technical students have a reduced chance for successful completion of training.
3. Standards for entrance to a technical education program can vary, depending on difficulty of program. Some should be almost as high as those for engineering.
4. Students who transfer from engineering curriculums frequently are unsuccessful in a technical program.
5. An adequate testing program is essential.
6. Counselors in technical education should have had industrial experience.
7. Junior college counselors must keep up to date regarding critical employment needs.
8. Pretechnical counseling should start in junior high school, and continue through senior high school.
9. High school (junior and senior) is the most effective place for vocational counseling.
10. There should be a close relation between adequate high school counseling and enrollment in technical curriculums.
11. Junior and senior high school counselors need to be familiar with junior college technical programs.
12. Courses in basic mathematics, science, and drafting in high school provide a good foundation.
13. Vocational-industrial or industrial arts courses in high school are valuable.
14. Close co-operation between junior college and contributing high school counselors is essential.
15. Meetings of junior college and high school counselors are valuable.
16. Junior colleges should provide high school counselors with printed brochures and other printed information concerning technical employment and training.
17. High school shop and science teachers can be very helpful in selecting technical students.

[10] Excerpted from "Those Important Junior High School Years," *School Management*, Vol. 2 (August, 1958), 7.

Several sources of information concerning employment opportunities for technicians are available. These include:

1. The National Manpower Council
2. U. S. Department of Labor
3. U. S. Office of Education
4. California State Employment Service
5. Local public agencies
6. Publications of the Army, Navy, and Air Force

Prospective technical students should be advised of their scholastic deficiencies and arrangements should be made for any student having such deficiencies to make them up before he enrolls in the technical program. A good testing program should be established for each curriculum and adjustments made as the demands of particular curriculums may indicate. Provision for removal of certain deficiencies should be provided in the junior college. The following four basic standards may be used in determining the acceptability of students for technical education programs:

1. High school graduation or equivalent. High school work should include:
   a. Some shop training
   b. Practical mathematics or one year of algebra
   c. General science or basic physics
   d. Elementary drafting

   In his high school work, the student should have made above average grades.
2. Average or better reading ability and good communications skills.
3. Normal or better intelligence.
4. Personal characteristics acceptable to employers.
5. Physical ability to do the work of the occupation.
6. Wage-earning experience in any occupation.

The following tests and devices suitable for use in selecting technician trainees were included in the report of the National Conference on Vocational-Technical Education held in Washington, D. C., in 1957.

### *Recruiting and Public Relations*

At present, neither youth, their parents, nor junior and senior high school teachers and counselors are well acquainted with the many new fields of technical occupations. This fact has contributed to the unsatisfactory number of students who are entering technical training programs. It has become obvious, therefore, that some recruitment will be necessary, in addition to that which takes place in the regular guidance channels. A program of public relations among schools, community organizations, and industry should be organized and maintained.

The practice of enrolling technical students from among engineering drop-outs is being used in a few California junior colleges. As a result, in some areas technical training is considered to be only "second best." This fact is partly responsible for the difficulty some junior colleges are having in filling their technical classes. A person has to be proud of what he is doing if he is to do his best work. If technical education is to occupy the position it deserves, and if properly trained technicians are to be made available to industry in adequate numbers, junior colleges must restudy their technical programs, present them to their several publics as high-grade educational preparation for well-paid employment, and raise the status of the technician to a level commensurate with the skills and knowledges required in his new occupational field.

Harold P. Rodes, formerly Assistant Director of Relations with Schools, University of California, Los Angeles, made the following

[12] "Meeting Manpower Needs for Technicians," Report of a National Conference on Vocational-Technical Education, *op. cit.*, p. 25.

comment concerning attracting students into a technical education program:

> I believe that the problem of getting well-qualified students to take technical institute work in California has been greater than in some other states where educational institutions have made their reputations primarily in the technical institute field. It would seem to me that the greatest potential for attracting more and better students into technical institute curricula in California lies in publicizing the need of industry for technical institute graduates . . .[13]

A corollary to Dr. Rodes's statement is that junior colleges offering technical education programs usually find it necessary to sell their "product" to employers in industry, many of whom do not know about the junior college as a source of trained technicians. The junior colleges in California must publicize their technical training programs and carry forward a continuing program of public relations, promotion, and information.

The several publics with which the junior colleges are concerned are:

Junior and senior high school students
High school counselors, administrators, and teachers
Parents of high school students
Industrial employers and associations
The general public

Some of the activities that have been used successfully by junior colleges to promote good public relations with these several publics and to publicize their technical education programs follow:

1. Activities with junior and senior high school students. These students constitute the number one public. They are the best salesmen for a good program.
   a. Continuously emphasize the fact that technical education is not a "second best" training program and that the technician is in great demand.
   b. Reach students through sports, college events of all sorts.
   c. Provide them with information through direct mail to their homes.
   d. Reach them through their counselors and teachers.
2. Activities with high school counselors, teachers, and adminstrators. (Counselors are key people in the promotional program in the high schools.)

[13] "Minutes of the Subcommittee on Engineering and Technical Institute Teachers," (A Subcommittee of the University of California—Junior College Conference Committee), Santa Monica City College, March 1, 1957, p. 3.

a. Inform them concerning the technical programs in the junior college.
b. Let them know the employment possibilities for technical jobs.
c. Invite them to the college, show them what the college has to offer, and provide them with leaflets, folders, and other descriptive materials.
d. Make available a film or film slides with scripts about the program.
e. Send them the college student publications containing "success stories" of former students.
f. Maintain personal contacts, either in groups or individually.

3. Activities with parents of high school students.
   a. Point out to them that a properly trained technician can be just as important as an engineer and earn about as much money.
   b. Tell them that the training takes only two years or less.
   c. Use radio and TV programs to reach parents.
   d. Encourage high school counselors to distribute printed materials concerning technical education to parents.
   e. Provide speakers, films, slides, and scripts at P.T.A., service clubs, church groups, etc.

4. Activities with industrial employers and associations.
   a. Make contact through advisory committees.
   b. Provide speakers for association meetings.
   c. Invite industrialists, employment directors, personnel managers, etc., to the college and show them what the school is doing.
   d. Solicit their help to follow up graduates in their employ.
   e. Offer extension classes both day and evening.
   f. Encourage apprentice and co-operative training programs.
   g. Visit industrial plants and county and city officials; get acquainted with possible employers.
   h. Use employers' bulletin boards, house publications, etc.

5. Activities for the general public.
   a. Provide complete and continuous information to newspaper and radio and television stations.
   b. Hold open house programs.
   c. Arrange with local theaters for showing of film trailers and slides.

d. Enter exhibits at fairs, etc.

e. Keep alumni working for the college.

There are many other methods and devices that are a part of any good public relations program. Those listed here are samples only and are representative of the many others that are helpful in promoting technical education in the community.

Recruiting an adequate number of suitable students for technical education programs has often been a difficult process in the past. However, fewer difficulties should be encountered as the status of the technician becomes more stabilized and as his identity becomes more widely recognized in industry and among high school students. Technical education is struggling for status; junior colleges must provide assistance and leadership in establishing a proper status for technical education in the community.

***Instruction***

Maintenance of a high quality of instruction is the most important factor in the success of a technical education program. Instruction requires continuous careful attention by administrators and supervisors, beginning at the time the curriculum is constructed. The pattern of instruction in all courses within the curriculum should be established before classes are organized, should be maintained or improved throughout the life of the program, and should be evaluated periodically.

Instruction in a technical education program can be evaluated by the use of the usually accepted criteria for judging any phases of formal education. These criteria include:

1. Adherence to the basic objectives of the curriculum.
2. Carefully organized sequence of units and topics in the several parts of the curriculum.
3. Intelligent use of texts, audio-visual materials, library, and other suitable teaching aids.
4. Maintenance of adequate records of student progress.

In addition to conforming to the above criteria, a technical education program should have the following important characteristics:

1. Courses in the major field, in related science, in mathematics, and in drafting, as well as laboratory and shop activities, should be integrated.
2. A problem-solving approach should be maintained in the presentation in technical subjects.

The "read, memorize, recite" routine is completely out of place in a technical program. The student has to have a thorough understanding of the basic concepts of his field and must know how to implement them on the job. He must be able to work out the answers to the problems encountered, using appropriate methods and sources of information.

3. Mathematics and science should be presented as tools in a problem-solving learning situation and not as exercises or unrelated materials. They must be basic, practical, and closely related to the major subject.

   Fundamental theory of the several appropriate branches of mathematics is sufficient background for practical application to the technical problems involved in the curriculum. In this field, mathematics is a tool, in the use and understanding of which adequate skills are essential. Philosophy, derivations, and theory beyond this point are superfluous in the relatively short technical training program. A rearrangement of the conventional order in which the various phases of mathematics are given usually can effect a satisfactory correlation with the major courses. Much of the necessary related mathematics frequently can be taught concurrently with the technical theory.

   Several studies are now in progress to discover just what mathematical processes are required for competency in several technical occupations and to what depth the study of these processes should be carried. None of these investigations is complete, but all indications point to a need in most technical occupations for varying degrees of skill in algebra, geometry, and trigonometry and only rarely for the use of the calculus, with little attention being given to mathematical theory and abstractions.

4. Physics, especially, which is a basic science in many technical curriculums, should be adapted to the needs of the technical student.

   > The gap between basic theory and the job situation must be bridged by a variety of realistic expressions, instruction materials, and teaching techniques. . . . Problem assignments must deal with industrial situations, not with monkeys climbing ropes nor with kings' crowns whose composition is suspect! . . . Laboratory work for the technician physics course should be carefully planned. Far more industrial realism is necessary than is present in the usual sequence of experiments for general college physics.[15]

[15] Norman C. Harris, "The Role of Physics in Technical Education," *Technical Education News*, XIV (April, 1955), 3.

5. English courses must develop a competency in report writing through instruction and practice, using the technical and scientific fields for subject matter. Accurate, precise communication skills are especially important in this type of employment.
6. Instruction should be directed toward developing skills with tools and materials. Such skills are absolutely essential to the success of a technician. It is probable that the skill training for the technician should be less intense than that for the mechanic but should be broad and varied. The technician needs to be able to do things with his hands. He should have, for example, sufficient machine shop or other related skills so that he can use laboratory lathes or other typical shop equipment in simple operations.

School administrators planning an instructional program should make sure that the college library contains ample up-to-date technical books, handbooks, and manuals. Because scientific and technical progress is so rapid, textbooks cannot be expected to be adequate. Current periodicals must be used to supplement them. The scope, type, and number of publications needed will be determined by the type and size of the technical programs being operated by the college. Films, slides, charts, and other audio-visual aids should also be available for use in the technical education program. These may be secured from manufacturers at moderate or no cost. Such aids are indispensable in a technical program and should be kept up to date and current. Demonstrations by industry are easily obtainable and provide excellent information. These may take place either in the plant or in the classroom or laboratory. Remedial courses in mathematics, English, and basic physical science should be given for entering students who do not have an adequate background in these subjects.

The following two paragraphs are quoted from the report of discussions in the vocational-technical education workshop, co-sponsored by the Bureau of Industrial Education, California State Department of Education, and the U. S. Office of Education, Division of Vocational Education, which was held in San Francisco in October, 1957:

> What should the public schools do to improve the training programs of technicians? It was the general concensus that more time must be spent with industry studying the work of the technician; finding out what the future trends and possibilities are; what skills and knowledges the technician will need two years from now; and to provide an on-going experimental training program which will assist employed technicians to keep pace. It was pointed out that industry is education-oriented and industry will be very happy to work with educators on meeting the needs of the workers of tomorrow.
>
> The training program should be in general a practical approach to technical subjects. For example, physics should be taught from the arithmetic approach

rather than the calculus approach. The representatives of industry can assist the schools by indicating the necessary competencies which the technician needs, and then it should be up to the educator how best to develop these competencies.[16]

Much technical subject matter and many teaching aids soon become obsolescent in this high speed age and must be kept up to date with current materials. Student interest can be kept at a high pitch by the introduction of speculative discussions concerning what is coming "day after tomorrow" in the fields of atomic energy, rocketry, missiles, electronic gadgets, and many other presently experimental applications of scientific principles.

This section on instruction has not reviewed the many customary and well-known criteria for judging the appropriateness or quality of instruction. It has emphasized only some of the more critical items in the training program for technicians.

It should be emphasized again that instruction in a technical curriculum can reach its greatest effectiveness only if the problem-solving or project approach dominates the teaching.

### *Maintaining Liaison with Industry*

The planning and development of a technical education program is a co-operative project between the junior college and industry. After the program has been inaugurated, a plan must be made for continuing close relations with the employing industry or industries. This liaison must not be allowed to lapse nor decrease in its effectiveness. Several types of activities can be used to continue the vital and productive working relations between college and industry that were established during the planning and development of the program.

1. Co-ordination
   a. A member of the staff should be designated as the co-ordinator of technical education. He is the key man in the liaison activities of a technical education program.
   b. The co-ordinator must have adequate time to carry on a carefully planned program of co-ordination.
   c. He must be thoroughly familiar with the jobs and processes in the industrial plants, offices, or laboratories employing technicians, and with all phases of technical instruction.
   d. He should be well acquainted and friendly with administrative and supervisory personnel in the industry.

[16] "Report of a Regional Workshop on Vocational-Technical Education." San Francisco, California, October 15-17, 1957. Co-sponsored by the California State Department of Education, Bureau of Industrial Education, and U. S. Department of Health, Education, and Welfare, Office of Education, Division of Vocational Education, p. 26.

e. It is essential that the co-ordinator work closely with junior college instructors and department heads in matters of curriculum, teaching, equipment, apparatus, and teaching materials in order to assist in keeping the instruction closely tied in to the needs of the occupation for which students are being trained.

f. He must keep informed continuously about changes in the occupational processes and materials of the co-operating industry or industries so that shifts of emphasis may be made in the training program when necessary.

g. He must keep the college administration informed in all matters pertaining to the program.

h. The co-ordinator must assist in procuring loans of equipment and apparatus from industry.

i. The co-ordinator's interests must not be confined exclusively to the pre-employment program but also must extend to extension classes, work experience education, and apprenticeship programs.

j. He should be intensely interested and active in a placement and follow-up program.

k. The co-ordinator must serve to interpret changes in industry to high school teachers, counselors, and administrators. The co-ordinator can assist high school department heads in adjusting the high school curriculum to meet junior college requirements for entrance into technical education programs that lead to employment.

2. Advisory Committees

Advisory committees should be organized to assist in the operation of a technical education program. They are extremely important to the continuing cordial and productive relationships between college and industry. They must be kept active and effective. The following points should be remembered concerning their membership:

a. Their membership should include representatives of both management and labor and should include personnel officers and supervisory personnel.

b. Membership on advisory committees should be changed periodically in order that the widest possible contact with industry can be maintained.

c. Their membership should include technicians. Advisory committee procedures and activities developed for vocational training for trades and industry are equally useful in the newer technical training field.

3. Consultations with Industrialists

The co-ordinator and advisory committees should invite key people in the employing industry or industries to consult with administrators and deans regarding the program, trends in manufacturing, effectiveness of the training program, future needs, new developments, source and training of instructors, equipment, and facilities. The larger the number of people who are acquainted with the college and its program and personnel, the more important and effective the college becomes, and the higher its status in its community.

4. Surveys and Research Activities

There are many studies and research projects that can be carried on co-operatively by the college and industry, thereby linking the college closely to the community. Possibilities in this area should be explored wherever feasible.

5. Professional Organizations

Many local and national professional organizations are active in their respective fields. Members are willing and anxious to serve on advisory committees and in a consultant capacity on an individual basis. There are local respresentatives in all of the larger cities. Some of these associations are:

The American Society of Tool Engineers
American Welding Society
American Society of Metals
American Foundrymen's Association
West Coast Electronics Association
Foundation for Instrumentation Education and Research

***Placement and Employment***

The real test of a technical education program is the product turned out by the school. No technical curriculum can be justified unless it meets the objectives of preparing students for employment.

However, the actual employment of graduates is not sufficient proof of the value of the course, especially during times of high employment. Students who have completed a technical training program should be able to start at a higher level of employment or should reach a high level more quickly than less well-prepared beginning workers. The results of training also should be reflected in improved attitudes and work habits.

For many years, we have heard the expression, "There is always a job for a man with a skill." This is literally true in industry today for the well-trained technician with initiative who has the ability to get along with people. There seems to be no roadblock to stop the properly educated technician.

A record of placements of graduates that is kept up to date is a valuable asset to any junior college technical program for use in public relations, promotion, and counseling. It helps to keep the local Board of Education informed of the success of the technical program; it is useful in selling the program to the community, the high school students, their parents, and counselors; and it supplies excellent material for newspaper stories. It also is a valuable aid in the evaluation of the effectiveness of the technical training program.

One encouraging and illuminating report concerning the extent to which Los Angeles junior colleges are serving the needs of industry and business comes from the research department of the Merchants and Manufacturers Association of Los Angeles. In 1954, this organization made a spot check among the employers of 500 recent graduates of the seven Los Angeles junior colleges. The letter of inquiry was sent by the Merchants and Manufacturers Association to those employers chosen from among the Association's industry members. Included with this letter was a questionnaire that identified the employee by name and gave the name of his college and his college major. It included only five items:[17]

1. Is the above-named person (the junior college graduate) still in your employ? Yes_____ No_____
2. Present job title_____
3. As a result of his junior college work, would you say that this individual, as compared with the average new hire without such college work, was:
   A. Better prepared for this job_____
   B. About as well prepared_____
   C. Less well prepared_____
4. In your opinion, did he obtain a better beginning job as a result of his junior college work? Yes_____ No_____ Don't know_____
5. Does this individual with his junior college training have any advantages in the matter of promotion or upgrading? Yes_____ No_____

There were 341 usable questionnaires returned. A tabulation of the replies yielded the following information:[18]

---

[17] "Survey Questionnaire—Junior College Curricula Evaluation Survey." Conducted by Research Department, Merchants and Manufacturers Association, 725 South Spring Street, Los Angeles, California. Los Angeles, Merchants and Manufacturers Association, 1954, p. 3.

[18] *Ibid.*, p. 5.

| | |
|---|---|
| Better prepared for job | 71.2 per cent |
| Better beginning job | 61.3 per cent |
| Advantages in promotion | 60.9 per cent |
| Present job related to major course | 88.8 per cent |
| Presently employed by named employer | 75.6 per cent |

One of the most significant results of this survey was the high percentage (75.6 per cent) of graduates "presently employed by named (original) employer."

Over-all local experience developed in another special survey made by the Merchants and Manufacturers Association showed that 45.3 per cent of all new employees who had been hired *without* junior college training had quit in less than three months. The contrast here is most significant. Whereas in the second instance slightly over one-half of the run-of-the-mill new employees lasted only three months in their new jobs, 75 per cent of the junior college trained group were still employed satisfactorily a year later by their original employers. The reasons for this startling difference were indicated by the employers. Employees who had had junior college training were better prepared for the new jobs, secured better beginning jobs, and had definite advantages in promotions.

The second survey made by the Merchants and Manufacturers Association showed a conspicuous financial advantage (from 20 per cent to 30 per cent) in favor of the junior college trained individual in beginning his occupational career. This financial advantage probably more than offsets the seniority and earlier income that might have been enjoyed by these junior college graduates had they left school earlier and entered employment. There is little doubt that promotion and upgrading is more rapid for these better trained employees.

One of the concluding statements in the report of the Merchants and Manufacturers Association's survey of junior college graduates was a recommendation that each junior college follow through with a detailed investigation of its graduates, with more factors included than were practical in this spot check.

The findings of the study reported in this bulletin indicate that placement and follow-up programs, for the most part, are operated on a very casual and sketchy basis. They vary from a few well-organized and carefully administered activities to an almost complete absence of any planned placement and follow-up service. The best and apparently most productive and useful programs are in the larger institutions with a counselor or dean in charge. In most colleges, the placement

responsibility, especially in industrial and technical areas, rests with the instructor or head of the department concerned. This plan can be quite successful especially if the activities are co-ordinated by some administrative or supervisory person.

The effectiveness of the instruction in lower-division transfer courses can be checked easily. Universities and state colleges usually can provide scholastic records of transferring students, and comparisons can be made with the students' junior college grades. In the occupational curriculums, however, indicators and measures of success after graduation are more subjective in nature and more difficult to acquire. It is, therefore, essential that adequate methods of gathering pertinent data, together with effective means of their analysis, be used in all junior colleges. Reproductions of various types of inquiry cards and letters, record forms, and other materials used by individual junior colleges in their follow-up studies will be found in Appendix B. Modifications of some of them may be helpful in individual situations.

***Evaluating the Program***

The evaluation of a technical education program already functioning is extremely important and should be carried out continuously in a systematic and objective manner from the time the program is initiated. It is an indispensable activity that is valuable to the school, the student, and to industry.

A guest editorial by Lynn A. Emerson in the November, 1958, issue of *Viewpoint* includes the following statements concerning the importance of evaluation:

> The products of the school are educated persons—youth prepared for occupational life in keeping with their abilities and aptitudes, and for living in a constantly changing world—adults with improved occupational skills and understandings. Evaluation is needed of the product, and of the educational establishment and its operation. The responsibility for the appraisal tasks is shared by the administrators, the supervisors, and the teachers. . . . Educational institutions must constantly evaluate if they are to remain in business. If they reach the point where their product—the educated person—no longer reaches objectives that are satisfactory and desirable they are replaced by more desirable institutions.[19]

The guidelines suggested in the preceding pages of this chapter may be helpful as a basis for developing an evaluation procedure for any technical education program in any junior college. These guidelines are intended to serve as aids to the administrator and his staff in determining whether a particular curriculum in the technical education program is producing the results anticipated within the philosophy and objectives established for that curriculum. These suggested

[19] Lynn A. Emerson, "Guest Editorial," *Viewpoint*, XIV (November, 1958), 7.

guidelines are similar in some respects to those used by the Engineers' Council for Professional Development (E.C.P.D.) in that organization's program of accreditation of technical curriculums in technical institutes and junior and community colleges, which has been referred to previously.[20]

The purpose of evaluating an educational program always must be primarily the improvement of instruction and the resulting improvement of the end product of the program—the student himself. This latter purpose is particularly important in the technical field of training because the graduate frequently moves directly into employment in which his "know how" is put to work in situations in which mistakes or failures could be disastrous. The best indication or test of the effectiveness of a technician's training is his success on the job, both in his entering assignment and in his advancement to more responsible positions. Certainly this is one of the most striking demonstrations to the training school that its program is successful or that it needs strengthening.

It is essential that there be serious experimentation and study among the junior colleges, either individually or collectively, in the development of evaluative instruments for the purpose of making further improvements in technical education programs in California. It is hoped that such experimentation will include consideration of the establishment of minimum standards for the planning, operation, and evaluation of technical education programs in the junior colleges of California.

The success of the graduates from the technical training program of a junior college is an extremely important factor in the building and maintaining of the reputation and status of the college in its community as a training center for technicians. No junior college administrator can afford to do less than his best to keep the technical education program of his institution on a high level. Only by continuous evaluation can this be accomplished.

Appendix B includes several forms, questionnaires, and check lists that should prove helpful in planning the procedures and processes of the evaluation program.

### *National Defense Education Act of 1958*

Title VIII of the National Defense Education Act of 1958, P. L. 864, which is popularly known as the "Area Vocational Education Pro-

[20] *Engineers' Council for Professional Development.* Twenty-Third Annual Report, 1954-1955, for year ending September 30, 1955. Detroit, Michigan: Engineers' Council for Professional Development, pp. 39-40.

grams," contains many provisions for the approval and conduct of technical education programs. It is interesting to note that the criteria included in the regulations governing the administration of this new law are very similar to the guidelines suggested in this bulletin. This similarity is no mere coincidence. Both were developed from basic considerations and fundamental concepts of education upon which a sound program of technical education must be built.

The minimum criteria that must be met by school districts to receive approval of area vocational education programs are indicated in the regulations governing the administration of the National Defense Education Act of 1958, which follow:

a. There is a need in the employment market for persons trained in the occupation for which training is provided.
b. The technical curriculum or curricula and the individual technical course content have been determined on the basis of an analysis of the occupation or cluster of occupations by competent persons.
c. (i) Either those enrolled in the program have the necessary general education background to benefit from the vocational instruction given in the program, and to fit them for the occupation for which the training is being given, or (ii) such necessary general education, including scientific education, is available to those enrolled as part of their total curriculum.
d. The program is of sufficient duration and there is sufficient time devoted to the technical courses in the curriculum to fit those enrolled for employment as highly skilled technicians.
e. Classrooms, shop, laboratory and facilities, including instructional equipment and supplies for effective instruction are to be available.
f. Personnel with professional and technical preparation and experience are to be employed as instructors and supervisors.
g. A system of student selection *based on interests, aptitudes, previous* education and work experience is to be maintained.[21]

This bulletin is primarily for the use of those who have responsibility for planning industrial and technical education shop building facilities. It does not prescribe standards but suggests criteria for specifying size, layout of floor space, lighting, heating, etc. It contains a bibliography.

National Manpower Council. *A Policy for Skilled Manpower.* New York: Columbia University Press, 1954, pp. 266, 277.

Included in this book are suggested services to be included in a well-organized public school guidance program. It stresses need for information as to available employment.

"Report of the California Statewide Conference on the Preparation, Credentialing, Recruitment, and Placement of Junior College Teachers." March 28-29, 1958. Sacramento: California State Department of Education, Bureau of Junior College Education, Sacramento, California, July, 1958.

This publication contains reports of presentations and discussions from the conference. It includes many points and ideas of value to junior college administrators for teacher recruitment.

SMITH, LEO F., and LIPSETT, LAWRENCE. *The Technical Institute.* New York: McGraw-Hill Book Company, 1956, pp. 132-146, 147-161, 163-178, 187-191.

This book contains suggestions for activity analysis, details of planning curriculum, general principles, typical curriculums. It also discusses teacher qualifications, training, preparation, and sources of supply and includes general material and many specific suggestions on recruiting, selecting, and job placement.

"Student Selection and Guidance." *Technical Education News,* XVII (Special Issue No. 1, 1957), 16.

This article contains a description of the student selection methods used at Connecticut State Technical Institute, Hartford, Connecticut. Selected methods described include an elaborate and effective system for choosing high caliber students for engineering technician training.

"Technical Education for Industry—Suggestions for Meeting the Need for Technical Education Programs in California Junior Colleges." A Revision of "Technical Education in California Junior Colleges" published in 1953, which is a report to the Committee on Vocational Education in the Junior College by the Sub-Committee on Technical Education. Sacramento: California State Department of Education, 1957, pp. 15-49.

This publication describes six typical technical curriculums found in California junior colleges. It includes analyses of these curriculums and helpful comments about them and their use. It suggests physical facilities and equipment suitable for the several technical curriculums described in this section of the publication. The recommendations are based on successful practices found in technical education programs currently in operation in certain California junior colleges. It also contains a series of statements of value in planning a program of student selection.

*Technical Education News,* XIII (Special Issue No. 4, 1954), 4-10.

This special issue includes several articles on public relations with high school and vocational counselors, industries, alumni. Media, techniques, and methods are listed.

"Technical Institute Programs in Wisconsin, General Standards, Trade and Industrial Series." Bulletin No. TI 502. Madison, Wisconsin: Wisconsin State Board of Vocational and Adult Education, June, 1956.

This publication contains a complete and detailed description of one technical curriculum with course descriptions, credit hours, list of recommended facilities, texts and reference books, and equipment.

"Trends and Developments in Technical Education in California Junior Colleges." An Interim Report of a Study of Technical Education in California Made by the Bureau of Industrial Education, California State Department of Education. Sacramento: California State Department of Education, 1958, pp. 6, 9, and 10.

Four junior college technical curriculums are listed with brief notes regarding each one. Brief comments as to procedures in developing technical curriculums are included.

TWORK, LESTER A. "Training Metallurgical Technicians." *School Shop*, XVIII (April, 1959), 36.

This article describes the curriculum for training metallurgical technicians in the Henry Ford Community College at Dearborn, Michigan, and lists much of the major equipment used in the laboratories of the college.

*Vocational Education in the Junior College.* A handbook prepared by a Committee Representing the California State Junior College Association, California Association of Adult Education Administrators, California State Department of Education. Sacramento: California State Department of Education, 1949, pp. 27-32, 76, 77, 78.

This handbook contains guide points and suggestions in establishing or improving the guidance services in junior colleges. It is especially good in technical programs.

WARD, PHEBE. *Terminal Education in the Junior College.* New York and London: Harper & Brothers Publishers, 1947, pp. 171-185, 228-238.

Current practices, recommendations, and suggested procedures for curriculum development are included in this book. It also reports techniques used and results of the Bakersfield, California, junior college study of pre-matriculation personnel procedures. It contains data and recommended guidance services for occupational training. A bibliography is included.

*Your Public Relations.* A Guide for Vocational Educators. Washington, D. C.: American Vocational Association, 1954.

This publication is an excellent comprehensive handbook containing suggestions, ideas, examples of existing successful programs and devices in school public relations, and a large list of selected references.

## Appendix A

# GUIDE TO THE COMMUNITY OCCUPATIONAL SURVEY [1]

Contents

*Part 1. Basic Questions on Community Occupational Surveys*

Answers briefly sixteen basic questions in regard to community occupational surveys. These questions are those that are asked most frequently by persons contemplating such studies. The answers are drawn both from the references listed and from the experiences of California school people who have conducted surveys.

*Part 2. Organizing the Survey*

Deals with eleven additional questions frequently asked concerning the most useful methods for organizing and carrying on a study of this type.

*Part 3. Putting the Data to Use*

Is concerned with the problem of how the information secured can be put to profitable use.

*Part 4. Steps to Be Taken in Conducting a Community Occupational Survey*

Summarizes seventeen steps that should be followed in conducting a local occupational survey.

*Part 5. Other Sources of Information*

Includes a selected annotated bibliography of survey reports, handbooks, and other similar materials that should be helpful in planning this type of project.

[1] Adapted from the following publication: "Guide to the Community Occupational Survey." California Guidance Bulletin No. 10. Sacramento: California State Department of Education, Bureau of Occupational Information and Guidance, 1948.

## PART 1

# BASIC QUESTIONS ON COMMUNITY OCCUPATIONAL SURVEYS

***A. What is meant by a community occupational survey?***

A community occupational survey is an organized method of obtaining a comprehensive body of information concerning the occupational life of a community or region, its jobs, workers, training needs and facilities, employment opportunities, and related facts.

***B. What are its major purposes?***

Its major purposes are: (1) to get information necessary to gear the educational program more nearly to the community's occupational needs and employment opportunities; (2) to improve in general the instructional and guidance services of the local schools; and (3) to foster better relations between the schools and the community.

***C. How is it conducted?***

No single method is best. The method to be used depends largely upon the specific objectives, the size of the community, and the facilities, funds, and staff available. However, certain practices and methods of conducting an occupational survey have been tried and found successful. This section describes some of those procedures which can be used by junior colleges in surveys especially in the technical occupations, and points out further sources of information for the guidance of the survey planner.

***D. What specific benefits may be obtained?***

Valuable information of the following kinds may be secured:

- Occupational distribution of employed technicians by age and sex.
- Amount of education and special training needed in various technical occupations.
- Occupations for which the junior college could help to train technicians.
- Kinds and numbers of jobs open to junior college graduates or less well trained students.
- Technical job descriptions and specifications.
- Estimated annual turnover by occupations.
- Technician supply, current and prospective sources.
- Opportunities for on-the-job training for adults.
- Opportunities for co-operative or work-experience (including apprenticeship) programs.

Objectives such as the following may be accomplished:

- To determine what technical courses the local junior college should offer, expand or drop.
- To give school personnel a better knowledge of the economic life of the community, business conditions, employees' characteristics, etc.
- To inform industrial, business and civic organizations and leaders about training and other services available in the junior college.
- To strengthen school-and-community relationships and give teachers and administrators an opportunity for personal contacts with businessmen, civic officials, industrial and public service leaders, and others.
- To develop favorable attitudes among business, industrial, and civic leaders toward the educational needs of the community.
- To provide the school guidance program with local occupational and related information.

*E. How will such a survey aid the school administrator?*

By providing the college administrator with information on how the residents of the community make a living and on occupational trends, a survey will assist him to develop a more effective program of technical education. Furthermore, the survey technique is a means of obtaining community co-operation in the solution of educational problems.

*F. How will it benefit the director or teacher of technical education courses?*

The survey will assist the director or teacher of technical education to identify or substantiate training needs, organize advisory committees, conduct more intensive studies of promising fields of work, strengthen his placement services, improve his instructional program and make contacts with business and industrial people.

*G. How will it benefit the teacher of general subjects?*

He may use the survey findings to enrich the content of his courses and to show the relationship of his subject to careers in the community. Moreover, if he has an opportunity to take part in the survey itself, he may acquire a better understanding of the business and industrial life of the community as well as a wider personal acquaintanceship with local residents.

*H. How will it aid the counselor?*

He will obtain very helpful experience in the survey itself. Later he will have accurate up-to-date information on local technical employment, i.e. occupational distribution, rising and declining fields of work, job qualifications, placement opportunities and other valuable data useful in a guidance program.

*I. How will the community profit?*

An up-to-date record of technical occupations in the community and possibly some indication of future trends will be available. If the publicity program has been effective, the citizens will have acquired a greater knowledge of local business and industry, a greater appreciation of the inter-dependence of workers of various kinds, and an even better understanding of their junior college. Local agencies such as the chamber of commerce, the state employment service office, and employers' organizations will have a special interest and will share in the survey results.

*J. What benefits will the students receive?*

The final objective of a survey of this kind is to assist the student toward a better vocational adjustment. Ideally, then, the benefits which the school administrator, the counselor, the teacher, or the community itself receives will be transmitted, directly or indirectly, to the student. This assistance may take the form of an expanded program of technical education, better guidance services, revised subject content in existing courses, opportunities for part-time work experience or on-the-job training, or improved placement services. Students may also benefit through actual participation in some phase of the survey and through a study of the findings and recommendations.

*K. How long does a survey take?*

That depends upon the size of the community and how elaborate the survey is. Actual collection of the data can usually be accomplished in a comparatively short time; tabulation, interpretation and reporting of data take much longer. From beginning to end, most surveys take from six months to a year.

*L. What geographical area should be covered?*

Surveys are usually confined to regular boundary lines—city, county, school district. There are obvious advantages, however, in covering the natural employ-

ment market area—the area in and around a center of population wherein workers can travel daily between their homes and their places of employment. A disadvantage, of course, is that it adds to the work.

***M. How much will it cost?***

Little information is available on this point. Costs range from a small cash outlay to several thousand dollars. The size of the community, the number and complexity of the interviews or questionnaires, the type of personnel use (students or paid workers), and the method of duplicating the final report are some of the factors determining the cost. Since an occupational survey is a legitimate educational activity, the cost can be paid from school funds. A budget should be set up and financial arrangements made before the survey is begun.

***N. Are there different kinds of occupational surveys?***

Yes. A survey may be limited to a single occupation or a single industry such as tool designing or the electronics industry. Or it may be broad in scope and cover practically all of the technical occupations in a community. A survey may include all fields of work but actually covers only a certain proportion of employing establishments on a sampling basis. The actual method of procuring data may also vary—from the informal-inquiry type to the intensive census method.

***O. Why do some surveys fail?***

Among the reasons why some surveys fail or only partially achieve their objectives are the following:

*The aims were not clear.* Aims which are vague, too general, too broad in scope, or "borrowed" from other surveys should be avoided. The survey planner must think through the problem, consider the desired end-products, formulate specific practical objectives, ask such questions as: What do we really need to know? How can we best get the necessary information?

*The survey was hurried.* Experience proves that careful planning pays; that time devoted to the training of interviewers and to "selling" the project to the community is time well spent.

*Personnel were inadequately trained.* From the director to the clerical worker, survey personnel must be appropriately selected and trained for their respective jobs; background experience and personality are often significant factors in assigning survey duties.

*Community cooperation was not secured.* Since the survey is essentially a cooperative technique, the support of certain community agencies is indispensable.

*The data were inaccurate or fragmentary.* Data that are hastily secured or based on unscientific sampling, careless recording of information, haphazard listing of occupational or job titles and descriptions, etc., may make the information and the report ineffectual.

*Too much was attempted.* Failure may result when the local facilities are not commensurate with the scope of the undertaking or when the time lag between the start and the finish of the survey is too great.

*The budget was inadequate.* If funds are inadequate to carry through the survey, the result may be the curtailment or elimination of an important step such as publication of the results.

*The questionnaire was inadequate.* The forms should not be too complicated or unwieldy to handle, too short, or contain ambiguous questions. They should produce the desired information and no more, and should be pre-tested on a small sample before being put into final form.

*Interpretation of the data was faulty.* Conclusions and recommendations should be justified by the statistical findings of the survey. Facts should not be twisted to support pre-conceived notions or desires of any particular person or

group in the community. One of the main functions of the advisory committee is to assist the director in making sound interpretations.

*Report of findings not published immediately.* Delay in completing analysis of data and publishing the results frequently makes the recommendations out of date and useless.

*No practical application was made of the findings.* A survey can be no better than the use which is made of the results. Early in the planning definite arrangements should be worked out with individuals and groups who are in a position to "do something about it" when recommendations are proposed; the board of education, for example.

*The public relations program was ineffective.* Faculty and community understanding and support of the survey are vital to its success. An adequate public relations program will acquaint the key persons and agencies with the need, purposes, methods, and the results of the survey. It should be carried on continuously throughout the survey.

***P. After the survey, what?***

After the results of the survey are made known, work still remains to be done. Only if plans are made for carrying out recommendations will the effort expended on the survey be justified. Since such a program may extend over a period of several years, it is desirable to set up a schedule indicating immediate and long-term steps to be taken in putting the recommendations into effect. All individuals and agencies concerned should, if possible, participate in the planning. Regular progress reports should be made as the plans are carried out.

## PART 2

## ORGANIZING THE SURVEY

To carry out a successful occupational survey requires competent leadership, careful planning, qualified personnel, and the cooperation of many individuals, organizations, and agencies. This part of the report will be devoted to a discussion of these factors and of specific survey techniques.

***A. What should the school administrator do?***

The school administrator will naturally be in a position of leadership throughout the survey and will have definite responsibilities particularly in the initial stages of planning. Some of them are suggested below:

*Step 1.* Hold informal preliminary talks with key persons on the college staff and in the community concerning the need and feasibility of a survey.

*Step 2.* Secure official approval of the local board of education.

*Step 3.* Obtain the consent of one or more community agencies to serve as co-sponsors.

*Step 4.* Make a public announcement of these actions accompanied by a statement of the purposes of the survey.

*Step 5.* Appoint an advisory committee to serve as a policy-making and advisory body. In addition to the school administrator himself, membership should include representatives of such groups as the chamber of commerce, management, labor, state employment service, local government, educational agencies, farm organizations, service clubs, parent-teacher groups, women's clubs, newspapers, radio, television, teachers, students and any other interested civic or social organization.

*Step 6.* Appoint a survey director after consultations with members of the advisory committee.

*Step 7.* Appoint individuals or committees to carry out prescribed survey assignments. (This step may be delegated to the survey director.)

***B. What specific functions might be assigned?***

The following are functions which are frequently required in an occupational survey. They are inter-related but are usually assigned to different individuals or committees in order to spread the work load. Coordination must be provided.

1. *Research.* To gather, study, and report on existing information and materials which are pertinent to the survey. (See question 4.)
2. *Forms.* To develop the necesary forms for gatherings, tabulating, and reporting survey data.
3. *Plans and procedures.* To determine the survey scope and methods; to develop a list of persons to be contacted; to work out cooperative agreements with sponsoring and supporting agencies.
4. *Public relations.* To acquaint all groups concerned with the purposes, methods, and uses of the survey and to solicit their support and cooperation.
5. *Supervision of field work.* To select, train, and supervise the persons who will do the actual field work.

***C. What are the duties of the survey director?***

General supervision of all survey activities, coordination of the work of the various committees; preparation of a guiding statement on the survey objectives; drawing up of a time schedule; preparation of the final report; and similar duties.

Since the director's office will be a clearing-house for survey activities, suitable office space, facilities, and clerical help should be provided. The director must have time to carry out his responsibilities; in some instances, this will require that he be relieved entirely of other duties, such as teaching, while the survey is in progress. He should be an ex-officio member of the advisory committee.

In view of his major role, the survey director should be carefully selected from among those persons available. Such traits as the ability to work with and lead other people, skill in public speaking, wide community contacts, broad experience both in and out of the field of education, and a knowledge of local business and industrial conditions should be considered in making a selection.

***D. What source materials should be investigated?***

The person or committee responsible for research should investigate such sources as the following, and report all helpful information to the survey staff as soon as possible.

Publications of the U. S. Bureau of the Census, Department of Commerce. Statistics of the labor force by states, counties, and principal cities.

*County Data Book.* A Supplement to the Statistical Abstract of the United States. Bureau of the Census. Price $2.75 (Buckram)

U. S. Census of Business, Department of Commerce. (Regional offices in California: 312 North Spring Street, Los Angeles 12; 870 Market Street, San Francisco).

(The three types of publications noted above may be available in public libraries or can be purchased from the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.)

Chamber of Commerce—Local and state. (California State Chamber of Commerce, 350 Bush Street, San Francisco.)

Employers' associations.

California State Employment Service—local office and state office. (California State Department of Employment, Sacramento 14.)

California State Department of Education. State Director of Vocational Education; or Chief of Bureau of Junior College Education; or Chief of Bureau of Industrial Education, Education Building, 721 Capitol Avenue, Sacramento 14.

California Department of Industrial Relations, Division of Labor Statistics and Research, 965 Mission Street, San Francisco 3.

State Board of Equalization, 1020 N Street, Sacramento 14, and local field offices. For reports on retail sales taxes collected.

Hearst Advertising Service, 710 Hearst Building, San Francisco 2, and 420 Petroleum Building, Los Angeles. For data on market analysis.

*California Blue Book.* 1954 edition (latest). Division of Documents, State Printing Office, Sacramento 14, or libraries. Price $5.13. Contains much economic data, by counties.

Publications of the former California State Reconstruction and Re-employment Commission. Consult local libraries.

Telephone directory (classified section)

City directory

Agricultural Extension Service

Colleges and universities

County and city planning commissions

Reports of surveys made in other communities

Public utilities companies

Trade and labor unions

Trade advisory committees

Libraries

Farm bureaus and related information

Bureaus of vital statistics

[Part V of this Appendix] (Bibliography).

***E. What forms are needed in a survey?***

Commonly used forms include the following:

1. *Letter or card of introduction.* This should serve to identify the interviewer, briefly state the purpose of the survey, encourage cooperation, and should be signed by the superintendent of schools or an official of one of the co-sponsoring agencies, or both.
2. *Schedule or questionnaire.* This is the principal form on which data from employers are secured. Since the type and number of items to be included will depend upon the specific purposes of the survey and other local conditions, the survey director and the committee on forms and instruments have the responsibility of developing a suitable questionnaire. As a guide for those persons, sample forms and a list of some 40 items which are frequently used in surveys are shown in Part V. Except in small communities, it may be advisable to arrange for mechanical tabulation of the data. The advice of a representative of International Business Machines Corporation or Remington-Rand, Inc. should be sought before the forms are developed.
3. *Interviewer's assignment sheet.* This sheet will contain the firm name or employer, location, nature of business and similar items to guide the interviewer.
4. *Youth survey form.* This form will be used when it is desired to collect information on the interests, activities, and plans of in-school youth or out-of-school youth or both. Such information is closely related to occupational data and is indispensable in planning new courses of study.
5. *Instruction sheet for interviewers.* Detailed instructions will improve the accuracy, uniformity and speed of the work of the interviewers.
6. *Tabulation forms.* Due to the close relationship between the objectives of the survey and the questionnaire and tabulation forms, they must be considered together. Tabulation sheets or cards must be designed to bring out the de-

sired information in readily usable form. For example, the following tabular summaries might be desired.[1]

a. Number of employed technicians by occupation, industry, age groups, and sex.
b. Number of annual job openings for beginning technicians arranged by occupations, and by employers.
c. Number and kinds of technical jobs by types and amounts of required training, i.e., high school, junior college, trade school, college or university.
d. Jobs for which the several areas of vocational and technical education might train or assist in the training of workers.
e. Number of technical employee separations during the last year by occupations, with reasons.

7. *Testing of forms.* Before the forms are printed, they should be tried out on a small scale in order that any weaknesses may be corrected.

### F. *What is the public relations job?*

Briefly, it is to keep the public informed on the purposes, methods, progress, and outcomes of the survey and to arouse the community interest and support necessary to accomplish the goals set. The value of the survey to the schools, the chamber of commerce, the employment service, the employers' groups, businessmen and others should be pointed out. Local organizations should be encouraged to prepare for the ultimate use of the survey data. This is an important task; for teachers, students, and citizens in general are frequently unaware of the purposes and procedures of a community occupational survey. Therefore each survey activity should be properly introduced through such methods as the following:

1. *Newspaper articles.* News stories and editorials can do much to develop needed public understanding and support. These should be properly timed with survey activities. Press representatives should either be members of the advisory committee or invited to attend its meetings. The college student publications can give valuable help.
2. *Speakers Bureau.* Brief well-prepared talks describing various aspects of the survey and pointing out the need for community cooperation may be given by members of a speakers bureau to the civic, business, and social groups in the community. Only persons who are able public speakers and well-informed on the subject should be given this assignment.
3. *Radio and T.V. programs.* Local radio and television stations may be used to good advantage. Prepared interviews with well-known citizens connected with the survey are especially effective.
4. *Student and faculty meetings.* Programs designed to acquaint the faculty and the students with the purposes of the survey and the parts which they can play in it are further means of publicity. These groups should be given an opportunity to ask questions and offer suggestions; they are in a position to build good will for the project and later, to help carry out recommendations.

### G. *What other plans and procedures are needed?*

A number of problems relative to the scope and methods of the survey must be considered. The following are major ones:

*Occupations to be covered.* The question of how complete a coverage of the total technical force in the community is desirable depends upon several factors: the size of the community, the amount of information required to achieve the desired ends, and the amount of time and effort which can be afforded in the undertaking. Studies indicate that surveys undertaken for technical training purposes generally have not covered all fields of interest in the survey. Where

[1] Adapted from an outline prepared by the Guidance Services Division, Department of Public Instruction, State of Michigan.

the main purpose is for vocational guidance, the coverage has usually been more complete. If necessary, time and expense can be saved by omitting firms having fewer than four employees. The committee may apply the following question in determining the final list of employers to be canvassed: Is the occupation, industry, or firm sufficiently significant in terms of the number of youth or adults employed? Another type of coverage is a limited or single-occupation survey. It has been described by Ward as a well-organized representative and significant look at one occupation in the community, often as one of a series, for the purpose of developing a curriculum to prepare students for that occupation. Its chief advantage is that it can be accomplished relatively quickly and inexpensively by a small staff with the assistance of an occupational advisory committee representing both management and labor. Over a period of years a considerable number of significant occupations in the community can be covered in this manner and appropriate training programs developed.*

*Methods of gathering data.* Either the questionnaire method, the interview method, or a combination of the two, may be used. The interview method is more popular, produces more accurate and complete data, but requires more time and effort. Some survey directors advocate the use of a questionnaire plus a follow-up interview in cases of slow or difficult returns. As noted above, a supplementary method which is a regular part of an industrial-education survey consists of a series of conferences between members of the school staff and representatives of management and labor in which (1) information on labor supply and demand, job qualifications, training requirements, and other pertinent data can be obtained or verified, and (2) arrangements for organizing training programs and placement services can be worked out cooperatively.

*Classifying the occupations.* In many occupational surveys the large variety of occupations to be covered necessitates the use of a standardized classification system. The two most widely used plans are probably the one employed by the Bureau of the Census and the system used in the *Dictionary of Occupational Titles.* Since the latter system is used in the public employment service and in numerous school libraries and counseling offices for filing occupational materials, it has obvious merits for survey purposes. One advantage of the Census system, however, is that its use makes possible the comparison of data gathered in the survey with data gathered in each decennial census.

A third plan for the classification of industries and industrial products is described in the *Standard Industrial Classification Manual,* issued by the Federal Bureau of the Budget in 1945.[2]

Note: (Comments re technical occupations.)

*Preparing a list of employers.* Either a list or a card file of employers to be contacted should be prepared as soon as the scope of the survey has been determined. The files of the chamber of commerce, Merchants and Manufacturers Associations or similar organizations, the local office of the state employment service, the city directory, and the telephone directory are the best sources of such information. The use of a 3 x 5 card is recommended for each firm on which can be recorded the name, address, and type of establishment, the telephone number, and if available, the name of the executive or contact person.

*Making a time schedule.* It is advisable to set dates for each phase of the survey even though the schedule may need to be adjusted from time to time as the work progresses.

---

* For further information on this technique, consult the publications of Emily G. Palmer, Phebe Ward, and Frank B. Lindsay listed in the bibliography.

[2] *Standard Industrial Classification Manual.* Volume 1, *Manufacturing Industries:* Part 1, *Titles and Descriptions of Industries,* 75 cents; Part 2, Alphabetic Index, $1.25. Volume 2, *Non-Manufacturing Industries* (one part only) 25 cents. For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington 25, D. C.

*H. What are the responsibilities of the field work supervisors?*

These persons must see that the interviewers are properly selected and trained and that the actual field work is carried out satisfactorily. Their functions can be divided into logical steps.

1. *Selection of interviewers.* Interviewers should be chosen with care. Their intelligence, interest, and personality will determine in large measure the adequacy of the survey returns. Survey directors generally agree that uninterested individuals should not be pressed to participate since enthusiasm is an essential element in this task. The use of students as interviewers is not always desirable. But where they have been carefully selected, trained, and supervised, their services generally have been satisfactory and they have profited from the experience. However, it is advisable to assign only mature individuals with appropriate training and experience to contact the larger business and industrial firms.
2. *Training of interviewers.* Those responsible for this function should be thoroughly familiar with the basic principles of interviewing as well as the various forms and procedures which the interviewers will use. Trial interviews should be held by the supervisors, to get suggestions for improving the forms and the interview techniques. The use of a good reference book, such as *How to Interview*[3] is also recommended.

   *Interviewing Techniques.* It has been found advantageous to have the interviewers follow a fairly uniform procedure. Consequently, in the training period, the supervisor should explain in considerable detail the purpose and use of the forms, emphasizing the system to be followed in classifying and reporting industries, occupations, and job titles. The interviewing procedure should be gone over step by step. It will be extremely valuable if the interviewers can observe one or more model interviews and then conduct practice interviews with each other.

   The field work will proceed more rapidly if the supervisor has anticipated some of the problems which are likely to arise and has instructed the interviewers in dealing with them. For example, the question of what the interviewer should do when the employer refuses to furnish information might be answered somewhat as follows: "Don't argue with him. Thank him and leave without further comment. Make a note of the name and address and report the facts to your supervisor at the close of the day."

   *Work assignments.* The size of the area assigned to each worker should be determined by a study of the number and types of establishments within it. Occasionally, it may be desirable to assign one individual to cover a number of establishments of the same type regardless of their location. On the whole, the block-by-block method of assignment is preferable. Some interviewers will finish early; they may be assigned additional territory, if necessary, or do follow-up work.

   Each interviewer should have a set of written instructions including a marked map of his district, specimen forms properly filled out, and other information to which he can refer from time to time. Interviewers should be asked to maintain a definite work schedule and to turn in regular progress reports.
3. *Supervising the field work.* When the interviewing gets under way, the supervisors, working under the direction of the survey director, will have the responsibility of keeping the field work going forward according to schedule. Among their specific functions are these:

   Calling on employers who are reluctant to furnish information and explaining to them the purposes of the survey and the value of the data.

[3] Walter Van Dyke Bingham and Bruce Victor Moore, *How to Interview*. New York: Harper & Brothers Publishers, 1941. $3.00.

Assisting the interviewers to meet various problems as they arise. (Telephone communication should be provided.)

Providing the public relations committee with information on the progress of the survey.

Checking the forms for completeness as they are turned in.

Maintaining an accurate check-list of establishments which have been covered and making further assignments.

*I. How can community organizations assist?*

Throughout this section the fact has been stressed that community-wide support is often the keynote to the success of an occupational survey. In most communities there are agencies, clubs, and other organizations which can assist in the project in one way or another. They should be encouraged to do so. Their interest and active support can be shown in one or more of the following ways:

Acquainting their members with the need, character, and uses of the survey

Supplying brief program time for talks in support of the survey

Providing volunteer workers for interviewing, tabulating or other services

Providing technical assistance in the form of mailing lists and other pertinent data

Contributing funds to help defray the survey costs

Furnishing speakers for the Speakers Bureau

Supporting the survey findings and assisting in carrying out the recommendations.

*J. What assistance can the State Department of Education give?*

Through its Division of Instruction, the State Department of Education is prepared to furnish consultant services to the public schools on occupational surveys. Staff members in the areas of junior college education and vocational education are available to assist local school authorities in planning surveys, analyzing and interpreting the data, and carrying out the resultant recommendations. Inquiries addressed to either of these two offices will be given prompt attention.

## PART 3

## PUTTING THE DATA TO USE

*A. What should be done when the returns start coming in?*

As the completed questionnaires are returned, they should be checked against the master list or card file and then examined for errors and omissions. Incomplete returns should be placed in a separate pile for rehandling by the original interviewer or a new one. Use of the telephone will save time in securing missing data.

Tabulation can begin as soon as an adequate number of completed returns are on hand. Much of the information will be in numerical form and can readily be tabulated. Other significant information or comments which may have been written on the questionnaire should be recorded (verbatim or in digest form) by question number or topic. Where an employer has offered some assistance or service, the fact should be noted in order that appropriate action may be taken at a later time.

If the tabulation is done by hand, the items to be tabulated are entered on large sheets, from which a count is then made, or on cards (numbered to correspond to their respective schedules) which may be easily handled, sorted, counted.

If the tabulation is done mechanically, all items to be tabulated are taken off on special cards, the nature of each item being indicated by punching the card at a particular spot according to a predetermined code. This requires careful examination of all questionnaires by the clerical staff to ensure accuracy in the tabulation process. Even when the tabulation is done by hand, certain items may be coded, e.g., the kind of occupation, the type of industry. This will facilitate the sorting and tabulating of a large volume of data. If several persons do the coding, written instructions should be provided to ensure uniformity. The kind and number of tabulations to be made will depend upon several factors: the specific objectives of the survey, its complexity, and the extent to which data must be "broken down" for analysis.

***B. How should the final report be prepared?***

After the data have been tabulated, the work of analyzing, interpreting, and reporting the results can begin. This is a critical step, requiring the combined efforts of the director, various members of the survey staff, and of the advisory committee. Essentially the task is one of converting a mass of facts and figures and opinions into a clear, significant, action-compelling report.

At this point, the director might re-examine the original purposes of the survey so that they will be constantly in his mind as he prepares the report. He must also recognize that his ultimate audience will be composed of persons with diverse social and educational backgrounds and interests. For this reason the copious use of tables, charts, graphs, maps and other illustrations is advisable as a means of putting across the statistical information. Art students may be able to assist in this phase of the report.

Because of its significance, special attention should be paid to the section of the report containing the recommendations.

***C. How should the recommendations be drawn up?***

The recommendations will determine, in large measure, the action which may be expected to take place as a result of the survey. Therefore, they should be drawn up only after careful study of the data by the survey director and the advisory committee. Recommendations should be sound in principle, based upon substantial evidence of need, and capable of being carried out in the local situation, *though not necessarily immediately*. Poor recommendations are costly. If they are impracticable or overdrawn, public good will and support will be dissipated. If they are weak and short-sighted, the potential value of the survey will be lost.

The following questions will serve as a guide to the formulation of recommendations:

1. Is the technical training program of the college generally in line with the occupational distribution and trends in the community?
2. What, if any, technical training offerings need to be initiated in the school? Expanded? Dropped?
3. What, if any, changes should be made in other curriculum areas?
4. Are the technical training needs of adults being met?
5. What employment opportunities does the community offer for high school graduates? Drop-outs? Junior college graduates? College or university graduates?
6. What changes need to be made in the junior college and contributing high school's instructional and guidance services to give students a better knowledge of the occupations and job opportunities to be found in the community?
7. How can the school and the community cooperate to provide better placement services for youth and adults?

8. Are there possibilities for the establishment of cooperative training (school-and-work) programs in the community? Of work experience programs? Of apprentice programs?
9. Do employers regard the schools as an important source of technicians?

*D. How can the survey results be put to practical use?*

Using the survey results for the good of the college program and the community itself is the culminating phase of a community occupational survey. As was indicated earlier, a planned program for carrying out the recommendations must be initiated if the time and effort put into the survey are to be fully justified. After all, the data collected are only means to an end, not an end in themselves.

At this time, then, the advisory committee and the director should work out systematic plans for putting the recommendations into effect. Outside help and advice may be need to be sought. A time schedule indicating approximately when each step in the plan should be completed will prove helpful. Regular progress reports will keep everyone informed as to what has been accomplished and what yet remains to be done.

Certainly the individuals and agencies concerned will have much work to do—both individually and collectively—if the goals are to be reached. Some ways in which the results of a survey may be utilized are suggested under three headings: (a) in the public schools, (b) in non-school agencies, and (c) in the community at large.

(1) *In the Public Schools.* The kind of group planning and action that may grow out of such a survey may be illustrated. Suppose that the data indicate favorable employment opportunities in a certain occupational field for some time to come, and that a recommendation to set up a training program has been made. What steps might need to be taken? The following are suggestive:

(a) Establish an advisory committee (employers and employees in the occupation) to advise and assist school authorities.
(b) Draw up the objectives of the training program.
(c) Study present training facilities in the school and in the community.
(d) Survey present teaching staff for qualified instructors.
(e) Determine needed facilities and staff.
(f) Estimate probable student enrollment through such means as a survey of in-school youth, and of adult workers in the occupation or related fields of work.
(g) Set up a budget and obtain necessary funds.
(h) Provide necessary facilities—classroom, laboratory, shop, equipment, etc.
(i) Employ the necessary teaching staff.
(j) Build the curriculum.
(k) Start the training program.

As a part of or in addition to the overall planning described above, various members of the school staff will have opportunities to use the survey data advantageously. Examples follow.

*School administrator.* Plan a series of faculty meetings to discuss the survey findings and their educational implications. Initiate studies by a curriculum committee or individual staff members looking toward improvement of the instructional program or the guidance service. Present data and special reports bearing on the survey to the board of education. Use data as a basis for strengthening school-community relations.

*Director of vocational and technical education.* Guided by the survey data and advisory committees, develop new technical training programs, long or short-term, or revise present courses to conform to changing conditions. The

director will be provided with comprehensive data on employment opportunities, occupational trends, and with further personal contacts with individuals and groups representing agriculture, business, and industry.

*Technical program teacher.* Use data on the occupations related to his area to assist in determining the need for new courses, to improve the content of the courses now offered, and to improve his work in the area of occupational information and placement services.

*Guidance worker.* Utilize the survey results to strengthen the overall guidance program; have available for counseling purposes community-wide information on occupations and industries, training facilities, placement opportunities, job requirements, worker qualifications and training requirements; have improved relations with youth-serving community agencies.

*The nontechnical teacher.* As a result of the survey—especially if he takes an active part in it—this teacher will have a much greater knowledge of the community in which he works, and hence a better understanding of the students whom he teaches; will be provided with a variety of material on the economic life of the community which can be used in developing group and individual projects in the classroom; will have made valuable acquaintanceships in the community.

*The School Board.* Utilize the information obtained through the survey and subsequent reports in establishing long-range school policies and plans, in setting up building programs, and in carrying on a public relations program.

(2) *In Non-School Agencies.* A number of groups or agencies in the community will find the survey results of value in connection with their regular functions.

*Chamber of Commerce.* Data on the technical labor force, and on industrial and occupational trends in the area will be useful to business organizations belonging to the chamber as well as to its industrial development committee. Such information also will assist the office force in answering inquiries and in getting out promotional literature.

*Employers' Associations.* Data on occupational distribution, trends, and characteristics of local technician employment will have a significant value in the work of these groups.

*The public employment service.* The data compiled will serve as a valuable supplement to the information already on file in this agency regarding many aspects of technical employment.

*Service clubs.* Information on occupational opportunities will assist such organizations in carrying on their vocational guidance and other youth-serving activities. It may also aid the club in keeping its membership in line with the occupational groups represented in the community.

(3) *In the Community at large.* A large majority of the local residents will be genuinely interested in the results of the survey and the implications of the data for the vocational guidance and training of youth and adults. Accordingly the public relations committee should use every available means to inform and mold public opinion regarding these matters. Newspaper articles and editorials, radio and T.V. programs, public meetings, club programs, posters and displays, printed reports and bulletins, teachers' meetings, and meetings of Parent Teacher Associations can be utilized for that purpose. The objective is a well-informed citizenry—a valuable asset when support of certain survey recommendations is needed in the community.

### E. *When is a survey completely finished?*

In a sense, a community occupational survey is never complete: when one is finished, it is time to begin another—or at least to follow up the first. Like the community with which it deals, the survey process is a dynamic thing, never

static. As the community grows or shrinks, as its working force changes in size and character, as new problems and forces affect its vocational life, the survey technique is available to register continually those changes and to assist the community to keep abreast of them.

## PART 4

## STEPS TO BE TAKEN IN CONDUCTING A COMMUNITY OCCUPATIONAL SURVEY

*A Check List*

The following steps will serve as a check list for the survey planner. They may be modified to suit local conditions.

____(a) Determine the need, feasibility, and chief purposes of an occupational survey of the community.

____(b) Obtain as sponsors one or more significant community agencies.

____(c) Organize an advisory committee which is representative of the community, and outside agencies concerned.

____(d) Prepare a budget of estimated expenditures and arrange for financial support.

____(e) Appoint a qualified person to serve as survey director and provide him with necessary facilities, clerical help, etc.

____(f) Appoint the necessary sub-committees and assign their duties. The following are typical of the duties of such committees:

- ____(1) Conduct preliminary research on (a) occupational data already available and (b) survey methods and reports of other communities.
- ____(2) Plan and carry on a continuous public relations campaign during the survey.
- ____(3) Determine the scope and method of the survey—the geographic area, the age, sex, race, and occupational groups to be covered, the extent and nature of the data to be obtained, and the method of securing the data.
- ____(4) Develop the necessary forms—letters, instruction sheets, questionnaire, maps, tabulation forms, etc.—and try them out.
- ____(5) Select and train the interviewers thoroughly.

____(g) Hold a final meeting of sponsors and workers to afford an opportunity for discussing plans, giving final instructions, asking questions, coordinating publicity, etc.

____(h) Begin the actual survey and complete the assignments as quickly as possible.

____(i) Check the returned questionnaires and arrange an early followup of incomplete or missing reports.

____(j) Tabulate the data after editing and coding the returns.

____(k) Study the findings and prepare the final report and recommendations.

____(*l*) Present the report and recommendations to those most concerned.

____(m) Publicize the report as widely as possible throughout the community.

____(n) Develop a planned program for carrying out the recommendations by the community agencies and others involved.

____(o) Review and keep a permanent record of the activities connected with the planning and conduct of the survey.

____(p) Provide for supplementary surveys if such are needed to secure information of a more specialized nature.

____(q) Consider means of bringing the survey information up-to-date periodically.

## PART 5

# OTHER SOURCES OF INFORMATION

BRANDON, GEORGE L. *Twin Cities Technicians.* A Limited Survey of Industrial Technicians. A Trial Run of State-wide Interview Instrument. East Lansing, Michigan: Michigan State University. College of Education, 1958, 62 pp.
A report of an occupational survey in Benton Harbor, Saint Joseph Area. Copies of questionnaires and tabulation of results.

HARRINGTON, GORDON M. *Technicians for Connecticut Industry.* A Study of Need for Technical Institutes. Hartford, Connecticut: State Department of Education, 1957, 52 pp.
Reports on a survey of student potential and demands for technical institutes in Connecticut.

SMITH, LEO F., and LIPSETT, LAWRENCE. *The Technical Institute.* New York: McGraw-Hill Book Company, 1956, pp. 113-128.
A good brief general chapter on technical surveys—a list of basic questions in planning an occupational survey.

"Technical Education for Industry—Suggestions for Meeting the Need for Technical Education Programs in California Junior Colleges." A Revision of "Technical Education in California Junior Colleges" published in 1953, which is a Report to the Committee on Vocational Education in the Junior College by the Sub-Committee on Technical Education. Sacramento: California State Department of Education, 1957, pp. 6-10.
Discusses surveys for determining needs for technical education, questions to be considered when planning technical curriculums.

*Vocational-Technical Education for American Industry.* Occupations, Selected References, Educational Programs. Circular No. 530, Washington, D. C.: U. S. Department of Health, Education, and Welfare, Office of Education, 1958, 25 pp.
Good brief discussion of technical education, various programs of technical education. Extensive up-to-date annotated bibliography.

WARD, PHEBE. *Terminal Education in the Junior College.* New York: Harper & Brothers Publishers, 1947, pp. 142-152.
A detailed outline of procedures used in several occupational surveys in San Francisco.

## Appendix B

# SELECTED SURVEY AND FOLLOW-UP FORMS

The sample forms included in this appendix have been used successfully by various communities in surveys and follow-up studies:*

Form No. 1. Card of Introduction for Interviewer
Form No. 2. Covering Letter Sent with Questionnaire
Form No. 3. A Short Form for Obtaining both Facts and Opinions
Form No. 4. Occupational Survey Questionnaire
Form No. 5. Analysis of Employees in Local Concerns Surveyed
Form No. 6. Survey of Technical Occupations—Interviews Schedule
Form No. 7. Technical Occupation Data Sheet
Form No. 8. Job Description
Form No. 9. A Questionnaire
Form No. 10. Outline of Questions on Technical Training for Industry
Forms No. 11a-11g. Seven Follow-up Inquiry Forms
Information Most Frequently Sought in Community Occupational Surveys

These forms are not necessarily suitable in all situations but suggest the type of form that may be used. In some instances, those shown here might be used with only slight modifications. As part of the plans for any community survey, a complete set of forms should be developed.

* Forms 1-5 are taken from the "Guide to the Community Occupational Survey," California Guidance Bulletin No. 10, *op. cit.* They may be used as a group. Forms 6-8 should be used together. They are used by permission of the Oregon State Department of Education, Division of Vocational Education. Forms 11a-11g are all follow-up inquiries to alumni.

FORM NO. 1

## CARD OF INTRODUCTION FOR INTERVIEWER

INTRODUCING

_____

(Signature of Interviewer)

Representing the _____ School District

in its

OCCUPATIONAL SURVEY

Your co-operation is appreciated!

(Signed)_____

Superintendent of Schools

FORM NO. 2

## COVERING LETTER SENT WITH QUESTIONNAIRE *

(Name and address) (date)

Dear Sir:

You are asked to co-operate with your local junior college in a vocational survey that will benefit both the school and the businessmen of_____.

Please fill out this week the form which is enclosed and keep it until it is called for within a few days by an interviewer, who will complete the survey.

The data collected will be used to improve the courses of study, to motivate the students to better work, and to provide information to the employers of our junior college students and graduates.

We shall appreciate your help in our efforts to make _____Junior College of greater service to you as well as to the students: *you as employer, they as employees in OUR town.*

Sincerely yours,
(signed)

_____

Superintendent of School District

* The covering letter frequently can secure co-operation, or lose it.

FORM NO. 3

## A SHORT FORM FOR OBTAINING BOTH FACTS AND OPINIONS

The _____ Junior College desires to improve its school program in the light of community needs, and is asking the businessmen of _____ to assist by supplying the information called for in the following questions:

I. Name of Business_____ Address_____
Type of product or service_____ Total No. of Employees_____

Number of Employees working as Technicians in these Fields:

| | *Check* | | *Check* |
|---|---|---|---|
| Industrial Electronics | ____ | Structural Design | ____ |
| Electrical Technology | ____ | Laboratory Technology | ____ |
| Electronics Technology | ____ | Air Cond. & Refr. Technol. | ____ |
| Mechanical Technology | ____ | Petroleum Technology | ____ |
| Civil Technology | ____ | Instrumentation | ____ |
| Aircraft Design | ____ | Tool Design | ____ |
| _____ | ____ | _____ | ____ |
| _____ | ____ | _____ | ____ |

(Other titles could be added as space allows)

II. Number of present employees who received their training in junior colleges: Total_____.

III. Referring to those employees who attended junior college, in your opinion, how well have they been trained? (Please check.) Adequately_____ Not up to my standards for new employees_____.

IV. Please state for those employees who were trained locally:
*Strong points:*
*Weaknesses:*
What would you recommend that _____ Junior College do to strengthen its educational program? In partial answer to this question, which technical occupations checked above offer particularly good employment prospects in your organization?

Your co-operation will be appreciated!

Your name_____ Title_____ Date_____

FORM NO. 6

## SURVEY OF TECHNICAL OCCUPATIONS—INTERVIEW SCHEDULE

Interviewer_____ Schedule No. _____

Date_____ Area No. _____

Checked by_____ Industry Group No. _____

Name of Firm _____

Address _____ Phone _____

This survey is being made by the Trade and Industrial Education Service of the State Division of Vocational Education in cooperation with your local public schools. Briefly, its purpose is to secure information about the number of technicians needed in selected occupational groups and about the training that will best prepare persons for employment as technicians.

Your cooperation in answering this questionnaire will be greatly appreciated. We are contacting approximately three hundred firms in the state for the same information. You may rest assured that the information you give us will be kept strictly confidential. Neither your firm nor specific information regarding it will be identified in any way in the final report.

First we would like to get a few general facts about your firm and about your employees.

Persons Interviewed

Name _____ Title _____

Name _____ Title _____

Name _____ Title _____

1. For how many years has your firm been in business? 1. _____
2. What is your present number of regular employees? 2. _____
3. What was your number of regular employees in 1954? 3. _____
4. What do you estimate your number of regular employees will be in 1960? 4. _____

Now we would like to get information about the job classifications in your firm that you feel are technical occupations.

A technical occupation is generally considered to be one requiring some of the knowledge and skills of both the engineer or other professional worker and the skilled craftsman. It usually involves the application of basic theories and personal judgment in a variety of situations and may require supervision of the work of others.

Typical technical occupations would include draftsmen, estimators, laboratory technicians, engineering aides, inspectors, electrical and electronics technicians, designers, and the like. Supervisory personnel classed as technicians would include foremen, superintendents, and others whose jobs require considerable technical knowledge.

(INTERVIEWER NOTE: Use of Occupational Data forms—a separate form for each occupation. If no technicians are employed, terminate the interview.)

5. From what source do you hire *most* of your technicians? 5._____
(Circle one answer only.)

1. Voluntary application
2. State Employment Service
3. Private Employment Service
4. Advertising
5. Union
6. Upgrading other employees
7. Friends
8. Schools
9. Personal contact
10. Other (specify) _____

> There is frequently a close relationship between the work of engineers and other professional personnel and that of technicians in that the technician's technical knowledge permits him to perform many of the duties formerly assigned to the engineer.
> The next few questions pertain to engineers and architects employed on the professional level. These persons may be four-year college graduates or may have acquired equivalent training in other ways.

6. What is the total number of engineers or architects now employed by you in each of the following fields?

| | 4-year college | other | | 4-year college | other |
|---|---|---|---|---|---|
| Architects | _____ | _____ | Metallurgical | _____ | _____ |
| Aeronautical | _____ | _____ | Chemical | _____ | _____ |
| Mechanical | _____ | _____ | Industrial | _____ | _____ |
| Electrical | _____ | _____ | Other (specify) | _____ | _____ |
| Civil | _____ | _____ | _____ | | _____ |
| | | | _____ | | _____ |

(INTERVIEWER NOTE: If answer is none, skip to item 9.)

7. About what proportion of your professional level employees' time, if any, is now spent on work at the technician's level? 7._____

1. 0– 5%
2. 6–10%
3. 11–15%
4. 16–20%
5. 21–25%
6. 26–30%
7. 31–40%
8. Over 40%
9. Don't know

8. About what proportion of their time would be spent at the technician's level if the supply of technicians were adequate? 8._____

| | | |
|---|---|---|
| 1. 0– 5% | 4. 16–20% | 7. 31–40% |
| 2. 6–10% | 5. 21–25% | 8. Over 40% |
| 3. 11–15% | 6. 26–30% | 9. Don't know |

**As you may already know, there are many types of classes that can be offered through public industrial-technical education. One type of class is designed to prepare young people or adults to enter an occupation; these classes are sometimes called "pre-job" training. I would like to ask a few questions about these classes. Keep in mind the type of training you would like to see; it may not be the same as the programs that are presently in operation. Our intention is to ask some very general questions regarding needs for training; then if there is a good deal of interest in a particular industry or occupational area, we will "follow up" this information by exploring specific training needs in more detail with advisory groups representing the industries concerned.**

9. Do you believe that pre-job technical training should be made available through the public schools to post-high school youth and adults? 9. _____
   1. Yes 2. No. 3. Don't know

10. Would your company cooperate in such a program by having a representative serve on committees to advise in establishing or operating it? 10. _____
    1. Yes 2. No. 3. Don't know

11. In which technical occupations do you feel the public schools at the post-high school level can offer instruction which would help persons qualifying for employment with your firm?

    _____ _____
    _____ _____
    _____ _____
    _____ _____

12. Would your company employ acceptable graduates of "pre-job" technical training programs in occupational areas which are represented in your firm if openings for them were available? 12. _____
    1. Yes 2. No. 3. Don't know

**One thing the schools do not want to do is operate training programs that are not needed. We would like to know of any organized training programs operating in industry so this information can be taken into account in planning school programs.**

13. Does your firm conduct formal classroom or skill instruction for your technicians? 13. _____

1. Yes 2. No. 3. Don't know

(*Interviewer note:* If answer is "no" or "don't know," skip to 16.)

14. Ordinarily, who trains these workers? 14. _____

1. Instructor
2. Supervisor
3. Instructor and supervisor
4. Fellow worker
5. Supervisor and fellow worker
6. Other (specify) _____

15. Do you consider this training program satisfactory? 15. _____

1. Yes 2. No. 3. Don't know

> Classes can be provided in junior colleges for employed technicians to improve their skills or technical knowledge. Occupationally competent and qualified local persons are usually hired and trained to teach these classes. For example, classes have been conducted for employed workers in industrial electronics, mathematics, statistical quality control, supervisory techniques, and many other subjects.
> Evening classes can also be provided to help employed workers advance to technician jobs. Example—journeyman electrician trained and upgraded to electronic technician, engineering aide, or estimator.

16. Approximately how many of your employed technicians could benefit from such classes? 16. _____

1. 1– 5
2. 6–10
3. 11–15
4. 16–20
5. 21–25
6. 26–30
7. 31–35
8. 36 or more
9. Don't know

17. In what areas do you feel these employees need improvement? (Circle the number in front of the answer or answers indicated.) 17. _____

1. Mathematics
2. Blueprint reading
3. Drawing
4. Supervision
5. Industrial relations
6. Communications
7. New materials or processes
8. Theory or science
9. Occupational skills
10. Don't know
11. Other (specify) _____

_____
_____
_____
_____
_____
_____

18. Approximately how many of your other employees would you upgrade to technicians' jobs if they qualified through supplemental evening instruction? 18. _____

1. 1– 5
2. 6–10
3. 11–15
4. 16–20
5. 21–25
6. 26–30
7. 31–35
8. 36 or more
9. Don't know

## TECHNICAL OCCUPATIONAL DATA SHEET

**(One summary sheet is needed for each occupation recorded in questionnaire.)**

1. Job Title_____ D.O.T. Code_____

2. Job Description (Note variation from D.O.T. description or, if there is no D.O.T. classification, list the principal duties and responsibilities.)

*(See Sample Job Description Attached)*

_____
_____
_____
_____
_____
_____
_____
_____
_____
_____
_____

3. How many are employed in this occupation? . . . 3. _____

4. How many do you anticipate you will employ in 1960? 4. _____

5. How would you classify the present supply of qualified workers in this occupation? . . . . . 5. _____

   1. Short  3. Surplus
   2. Adequate  4. Don't know

   (INTERVIEWER NOTE: If answer is "adequate," "surplus," or "don't know," skip to item 7.)

6. How many additional technicians would you employ in this occupation if an adequate supply were available? . . . . . 6. _____

7. Does your firm have a labor-management agreement covering this occupation? . . . . . 7. _____

   1. Yes  2. No  3. Don't know

   Name of labor organization:_____

   _____

8. What training should these technicians have in each of the following areas to qualify for employment in your firm? (Briefly indicate

extent of training desirable, e.g., Mathematics: algebra, geometry, and simple trigonometry.)

Mathematics _____

_____

Electrical Theory _____

_____

Electronics _____

_____

Physics _____

_____

Chemistry _____

_____

Production Control _____

_____

Materials & Processes _____

_____

Supervisory Practices _____

_____

Communications (report writing, speaking, etc.) _____

_____

Industrial Relations _____

_____

Other _____

_____

_____

_____

Manipulative Skills _____

_____

_____

9. How long an on-the-job training period do you estimate would be required to qualify a high school graduate for employment in this classification? . . . 9. _____

| | | |
|---|---|---|
| 1. 1 to 3 months | 4. 2 years | 7. over 4 years |
| 2. 4 to 6 months | 5. 3 years | 8. don't know |
| 3. 1 year | 6. 4 years | |

FORM NO. 8

## JOB DESCRIPTION

(A sample job description to be used with Form No. 7.)

*Position Title:* Electronics Technician

*Work Performed:*

Fabricates, assembles, checks out and installs aircraft electrical testing devices such as electrical harnesses, junction boxes, actuating gigs, and automatic switch box testers. Builds testing units for aircraft assemblies having a combination of hydraulic, electrical and pneumatic components such as electrically actuated valves, actuating cylinders with limit switches, hydraulic pumps and checking valves.

Fabricates and checks out public address components and intercommunication apparatus. Fabricates, checks out and installs simple radio testing units such as radio loop testers and interphone amplifier test panels.

Works from engineering detail assembly drawings, schematic wiring diagrams, sketches, and verbal information.

Performs rework wherein the operations are essentially the same as required for the work described above.

*Typical Materials, Tools and Equipment Used:*

Materials worked on: Ferrous and non-ferrous metals and their alloys; nonmetallic materials.

Materials worked with: Lubricants, lacquers, wax, lead-tin and silver solder.

Tools used: Radio mechanics' hand tools; portable drills, hand torches, soldering irons, thermometers, rules.

Equipment used: Drill presses, pedestal grinders, circular saws, engraving machines, punching machines; sanders; testing equipment such as voltmeters, ammeters, D.C. bridges, speed indicators, milli-voltmeters, milli-ammeters.

*Knowledge and Ability Required:*

To build, check out and install aircraft electrical testing devices, and communication equipment. To set up and operate machine tools listed above. To use radio mechanics' hand tools and testing devices listed above. To work to close tolerances. To manually pull, push or lift over 25 lbs.

To apply a knowledge of electrical and electronic shop practice and procedure. To read and interpret engineering blueprints. To use arithmetic involving decimals and fractions.

## A QUESTIONNAIRE SURVEYING THE EMPLOYMENT OPPORTUNITIES FOR ENGINEERING TECHNICIANS IN MILWAUKEE (Confidential) *

Name of company (optional) _____

Total number of employees . . . . . _____

Total number of engineers employed . . . . . _____

Total number of technicians employed (A technician is here defined as a person whose job requires more than 4 years of high school training but less than 4 years of college work) . . . . . _____

Number of technicians employed in the electrical field . . _____

Number of technicians employed in the electronic field . . _____

Number of technicians employed in the mechanical field . _____

Number of technicians employed in the chemical field . . _____

Number of technicians employed in the metallurgical field . _____

Number of technicians employed in the structural field . . _____

Number of technicians employed in any other field (please specify) . . . . . _____

---

Our technician-level jobs are now filled by:

a. High school graduates . . . . . _____ Per cent

b. High school graduates with some college or evening school training . . . . . _____ Per cent

c. Engineering graduates . . . . . _____ Per cent

d. Other (specify) . . . . . _____ Per cent

_____

_____

_____ _____ Per cent

In three years our total labor force will probably expand by . . . . . _____ Per cent

In three years our technician level jobs will probably expand by . . . . . _____ Per cent

What percentage of his post-high school training do you believe a technician should spend in academic and technical areas?

Academic _____ per cent

Technical _____ per cent

## REPORT OF OCCUPATIONAL EXPERIENCES OF FORMER TRADE AND INDUSTRIAL STUDENTS *

Name of School _____

1. Please check the occupational field in which you received your full-time vocational preparatory training:

| | | |
|---|---|---|
| 1.___Auto Mechanics | 4.___Baking; Cooking | 8.___Printing |
| 2.___Radio TV; Electronics | 5.___Cosmetology | 9.___Drafting |
| 3.___Machine Shop | 6.___Vocational Nursing | 10.___Electricity |
| | 7.___Welding | 11.___Carpentry; Mill. Cab. |
| | | 12.___Aircraft Mechanics |

2. How many months did you attend this course? _____

3. Did you receive your vocational training in: (Please circle grade or grades or check)

   a. senior high school grades? _____ 10 11 12
   b. junior college grades? _____ 13 14
   c. adult? _____ 1.___Yes 2.___No

4. Did you receive: (Please check)

   a. a high school diploma? _____ 1.___Yes 2.___No 3.___Don't know
   b. a junior college Associate in Arts Degree? _____ 1.___Yes 2.___No 3.___Don't know
   c. a certificate of completion? _____ 1.___Yes 2.___No 3.___Don't know

5. If your work was taken in a junior college, were you registered as an Associate in Arts Degree student? 1.___Yes 2.___No 3.___Don't know

6. Are you now:

   a. attending school full-time? _____ 1.___Yes 2.___No c. employed? 1.___Yes 2.___No
   b. in military service? 1.___Yes 2.___No d. other 1.___Yes 2.___No

7. If employed, is your employment:

   a. in the occupation for which you received vocational school training? _____ 1.___Yes 2.___No
   b. in an occupation related to that for which you trained? 1.___Yes 2.___No

8. If you are NOT now employed in the occupation for which you trained, do you expect to enter (or re-enter) that occupation?

   1.___Yes 2.___No 3.___undecided

* Form No. 1, 1956, developed by the Trade and Industrial Follow-up Committee, Bureau of Industrial Education, California State Department of Education.

9. Would you say that your vocational school training was (or will be) helpful:

a. in getting your first job? 1.___very helpful 2.___helpful 3.___of little help

b. in getting a first job with more pay or on a higher level? _____ 1.___very helpful 2.___helpful 3.___of little help

c. in getting promotion or advancement on the job? 1.___very helpful 2.___helpful 3.___of little help

10. Do you feel you could recommend vocational training in this school to your friends? _____1.___Yes 2.___No 3.___undecided

## REQUEST LETTER TO ALUMNI

Dear Alumnus:

It has been about a year now since you completed your work at _____ College. We know that you feel, as we do, that graduation did not mark the end of your association with your Alma Mater. Your college has a continuing interest in her graduates and would like to know about *your* progress.

You will be rendering a fine service to _____ by completing the enclosed questionnaire and returning it promptly in the stamped envelope provided. This will take only a few minutes of your time and will be of great value to us at the college as we make plans for future years. Please do your part in helping us to obtain a 100% response from members of the class of 1955.

Thank you for your cooperation, and best wishes for the years ahead.

Very truly yours,

Placement and Follow-up
Counselor

## STUDY OF GRADUATE OF _____ COLLEGE

I. For Those Who Are in School

1. Name of school _____
(University or College)

2. Are you still engaged in the same major field of study that you had at _____? Yes ____ No ____.

3. In general, how well did _____ prepare for your college work? Poorly ____ Adequately ____ Very well ____.

4. (a) Were there any specific areas of training which inadequately prepared for your present college work? Yes ____ No ____.

(b) If so, please list specific examples:

_____
(English, Math, Science, etc.)

(c) What suggestions can you offer which might strengthen our program?

(Use back of this sheet)

II. For Those Who Are Not in School

1. What is your present activity? (Please check one)

(a) Working ____ (b) Looking for employment ____ (c) In *the armed forces* ____ *(d) Housewife* ____ *(e) Other* ____.

2. If you are working, please describe the jobs you have held since graduation:

| *Employer or Firm* | *Title of Job or Kind of Work* |
|---|---|
| | |
| | |

3. What was your major field of study at _____?

4. While at _____ did you take courses designed to prepare you for your present job? Yes ____ No ____.

5. (a) Are you working on a job related to your school major? Yes ____ No ____.

(b) If your answer was "Yes" how did your _____ training prepare you for your job? Poorly ____ Adequately ____ Very well ____.

6. What suggestions can you offer which might strengthen our program? (Use back of this sheet)

7. (a) Do you expect to enroll in college for further work in the future? Yes ____ No ____.

(b) If so, where? _____

III. Name _____

Address _____
Number Street City

## SAMPLE RETURN POSTCARD INQUIRY TO ALUMNI

Dear Alumnus: Fall, 1958

Once again _____ College is interested in contacting former students in an attempt to find out where you are, how you are, and what you are doing. We are sending these cards to every graduate of _____, including the classes of 1947 thru 1957. Please complete the attached card and return it to us as soon as possible. Only a moment of your time will be required, but it will provide your Alma Mater with valuable information for future planning and also help to determine the results of the investment made by both you and the College while you were here.

Thanks for your prompt attention, and best wishes for the years ahead.

Sincerely,

_____, Placement Counselor

## INFORMATION MOST FREQUENTLY SOUGHT IN COMMUNITY OCCUPATIONAL SURVEYS *

The following kinds of information have been sought most frequently in 80 community occupational surveys. The numbers in parentheses indicate the number of times a particular item was included in a survey.

*Employing establishments:*
- Identity of firm (60)
- Type of product or service (61)
- Identity of informant (40)

*Employee Characteristics:*
- Occupation (80)
- Sex (70)
- Age (38)
- Skill group (17)
- Education; special training (10)
- Part or full-time schedule (9)

*Job requirements or preferences:*
- Education (53)
- Special Training (38)
- Experience (29)
- Age (27), Sex (9)

*Working conditions:*
- Wages or wage range (28)
- Chances to advance (13)
- Hours per week (12)
- Length of learning period (8)

*Worker demand and supply:*
- Labor surpluses and shortages (27)
- Source of labor supply (27)
- Number hired last year (23)
- Annual turn-over (22)
- Rush and slack seasons (22)
- Employee weaknesses (12)
- Trends, best opportunity for employment (12)
- Number employees (maximum and minimum) (11)
- Number dropped last year (10)
- Number beginners hired last year (10)

*Training:*
- Plant program and facilities (32)
- Willingness to co-operate with school program (16)
- Employers' suggestions on school program (25)
- Possibilities and needs (12)

*Others:*
- Equipment used (27)
- Space for remarks (20)
- Employer's attitude toward hiring youth (---)

*VOCATIONAL EDUCATION; *TECHNICAL EDUCATION; COURSE DESCRIPTIONS; *COURSES; *CODIFICATION; STATE STANDARDS

To standardize enrollment data collection and dissemination, instructional titles and code numbers have been organized under course titles and occupations for vocational agriculture, distributive, health occupations, home economics, office occupations, technical, trade and industrial, and work experience education. A six-digit code number can be used to indicate several levels of specificity within any one of these instructional areas. Descriptions of courses are included for those which are broad or which cannot be explained by title alone. This code is in compliance with a tentative reporting procedure established by the U.S. Office of Education under the name, "Standard Terminology for Instruction in State and Local School Systems: An Analysis of Instructional Content, Resources, and Processes." SECTION 3

Prepared by
VOCATIONAL EDUCATION SECTION
DIVISION OF INSTRUCTION
State Department of Education

CALIFORNIA STATE DEPARTMENT OF EDUCATION
MAX RAFFERTY, Superintendent Public Instruction
SACRAMENTO—1967

VT005158

## PREFACE

The complex nature of vocational education necessitates the standardization of data dissemination and collection. The instructional codes and titles will provide a uniform system of reporting vocational education enrollments and assure compliance with reporting procedures established by the U. S. Office of Education.

Future correspondence pertinent to rules and regulations applicable to vocational education will be sectionalized as follows:

| | |
|---|---|
| Section 1 | California Interim State Plan for Vocational Education |
| Section 2 | Reimbursement Procedures |
| Section 3 | Instructional Codes and Titles |
| Section 4 | Reports |
| Section 5 | Personnel Directory |
| Section 6 | Miscellaneous |

A loose-leaf binder with appropriate sections will enable the educational unit to maintain an up-to-date handbook that is readily available for reference.

DONALD E. KITCH
Acting Chief,
Division of Instruction

WESLEY P. SMITH
State Director
Vocational Education

## AGRICULTURE

01.00 00

Agriculture is comprised of the group of related courses or units of subject matter which are organized for carrying on learning experiences concerned with developing knowledge, understandings, and skills involved in preparation for or upgrading in occupations requiring knowledge and skills in agricultural subjects. The functions of production agriculture, agricultural supplies, agricultural mechanization, agricultural products (processing), ornamental horticulture, and the services related thereto, are emphasized in the instruction designed to provide opportunities for pupils to prepare for or improve their competencies in agricultural occupation. An agricultural occupation may include one or any combination of these functions.

Where there are Future Farmers of America (FFA) Chapters and related leadership training and supervised occupational experience programs they are important instructional media and are highly significant integral activities which aid agricultural education in making contributions to the guidance and total general education development of pupils. The Future Farmers of America and related leadership training permeate every aspect of the instructional program in agriculture.

Included in this subject matter area are the items of information which identify various aspects of agriculture.

01 00 Agricultural Production -- Subject matter and learning activities which are concerned with the principles and processes involved in the planning related to and the economic use of facilities, land, machinery, chemicals, finance, and labor in the production of plant and animal products. In practice, activities include classroom instruction and laboratory experiences, in and out of school, including farms and other agriculturally related establishments. Aspects of production agriculture are organized under a variety of descriptive titles, such as Animal Science, Plant Science, Farm Mechanics, Farm Business Management, and Other Production Agriculture.

02 00 Agricultural Supplies -- Subject matter and learning experiences which are concerned with preparing students for occupations which provide consumable supplies used in the production phase of agriculture--including consultative and other services.

03 00 Agricultural Mechanics -- A combination of subject matter and activities designed to develop abilities necessary for assisting with and performing the common and important operations or processes concerned with the selection, operation, maintenance, and use of agricultural power, agricultural machinery and equipment, structures and utilities, soil and water management, and agricultural mechanics shop.

04 00 Agricultural Products (Processing) -- A combination of subject matter and planned learning experiences designed to teach information, processes, science principles, and management decisions concerned with agricultural competencies in the food technology occupations. The groups of products include (1) meat, fish, poultry, and eggs; (2) dairy products; (3) fruits and vegetables; (4) cereal grains, and (5) other foods and beverages. Instruction may be provided in any or all groups of these products.

05 00 Ornamental Horticulture -- Organized subject matter and practical experiences which are concerned with the culture of plants used principally for ornamental or aesthetic purposes. Subject matter and practical experiences in ornamental horticulture are organized under such descriptive titles as Arboriculture, Fine Turf Management, Floriculture, Greenhouse Management, Landscaping, Nursery Operation, and Other Ornamental Horticulture.

06 00 Agricultural Resources -- A combination of subject matter and planned learning experiences which are concerned with the principles and processes involved in the preservation and/or improvement of natural resources such as air, forests, soil, water, fish, and wildlife for economic and recreation purposes. Instruction also emphasizes such factors as the establishment, management, and operation of forest lands used for recreational purposes.

07 00 Forestry -- An organization of subject matter and learning activities concerned with the management of trees grown as a crop. Other aspects of forestry are protection, logging, wood utilization, recreation, and special products.

9900 Other Agriculture (Specify) -- Include here other organized subject matter and experiences emphasized in agriculture which are not listed or classifiable in one of the above categories.

## DISTRIBUTIVE EDUCATION
## (DISTRIBUTION AND MARKETING)

### 04.00 00

Distributive education (distribution and marketing) includes various combinations of subject matter and learning experiences related to the performance of activities that direct the flow of goods and services, including their appropriate utilization, from the producer to the consumer or user. These activities include buying, selling, transportation, storage, marketing research and communications, marketing finance, and risk management.

Distributive education is a program of occupational instruction in the field of distribution and marketing. It is designed to prepare individuals to enter, to progress, or to improve competencies in distributive occupations. Emphasis is placed on the development of attitudes, skills, and understandings related to marketing, merchandising, and management. Instruction is offered at the secondary, post-secondary, and adult education levels. Distributive occupations are found in such businesses as retail and wholesale trade; finance, insurance and real estate; services and service trades; manufacturing; transportation and utilities; and communications.

01 01 Advertising Services -- Organized subject matter and learning experiences related to the tasks performed by distributive employees and management in demand creation, planning placement, and evaluation of sales promotion activities utilizing merchandising aides and mass media.

01 02 Apparel and Accessories -- Organized subject matter and learning experiences related to the variety of sales, fashion, and sales-supporting tasks performed by employees and management in establishments primarily engaged in selling clothing of all kinds and related articles for personal wear and adornment.

01 03 Automotive and Petroleum -- Organized subject matter and learning experiences related to the variety of sales and sales-supporting tasks performed by employees and management in retail or wholesale establishments engaged in the distribution of cars and trucks, automotive parts, accessories and equipment, or gasoline and petroleum products.

01 04 Finance and Credit -- Organized subject matter and learning experiences related to the tasks performed by distributive employees and management of institutions engaged in deposit banking or closely related functions, extending credit in the form of loans, services allied with the exchange of securities and commodities, or consumer credit and collections.

01 05 Food Distribution -- Organized subject matter and learning experiences related to the variety of sales and sales-supporting tasks performed by employees and management in establishments primarily engaged in selling food for home preparation and consumption or selling a general or commodity line of food products at wholesale.

01 06 Food Services -- Organized subject matter and learning experiences related to the sales and merchandising tasks performed by employees and management in establishments serving prepared foods and drinks for consumption on their own premises or at a place designated by the customer.

01 07 Foreign Trade (International Trade) -- Organized subject matter and learning experiences related to the tasks performed by distributive employees and management in export sales, trade controls, foreign operations and attitudes, and monetary problems and other elements in international marketing.

01 08 General Merchandise -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by retail employees and management engaged primarily in selling a variety of merchandise in department stores, junior department stores, mail-order houses, variety stores, general merchandise stores, discount stores, direct selling organizations or merchandise vending units.

01 09 Hardware, Building Materials, Farm and Garden Supplies, and Equipment -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by distributive employees and management in establishments engaged primarily in selling the basic lines of hardware, lumber, building materials, supplies, and equipment for home construction, and farm and garden supplies and equipment at retail, at wholesale, or to contractors.

01 10 Home Furnishings -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by employees and management in establishments engaged primarily in selling merchandise used in furnishing the home such as furniture, household appliances, floor coverings, draperies, and specialized lines of home furnishings.

01 11 Hotel and Lodging -- Organized subject matter and learning experiences related to the tasks performed by distributive personnel and management in establishments providing lodging or lodging and meals or other tourist services on a year-round or seasonal basis to the general public or to an organization's membership.

01 12 Insurance -- Organized subject matter and learning experiences related to the tasks performed by sales and management personnel for insurance carriers of all types, or by agents representing carriers and brokers dealing in the sale or placement of insurance contracts with carriers.

01 13 Management (General/Miscellaneous) -- Organized subject matter and learning experiences related to the tasks performed by owners, proprietors, and managers in organizing and operating a business enterprise, usually a retail or service trade firm, a wholesale firm, or an unincorporated business.

01 14 Marketing (General) -- Organized subject matter and learning experiences related to the tasks performed by employees and management responsible for demand creation and a constant flow of goods and services to consumers and users at the rate of production.

01 15 Mid-Management -- Organized subject matter and learning experiences related to the tasks performed by personnel who serve primarily in a liaison capacity between employees and management and have responsibility for the supervision of products and/or people.

01 16 Real Estate -- Organized subject matter and learning experiences related to the sales, appraisal, and management tasks performed by real estate operators and owners and lessors of real property, as well as buyers, sellers, developers, agents, and brokers.

01 17 Retailing (General/Miscellaneous) NEC -- Organized subject matter and learning experiences--not listed or classifiable in other major categories--related to the sales and sales-supporting tasks performed by employees and management of establishments engaged in selling merchandise purchased for resale to customers for personal, household, or farm use.

01 18 Transportation -- Organized subject matter and learning experiences related to the physical distribution and the sales, storage and management tasks performed in enterprises engaging in passenger and freight transportation, public warehousing, and services incidental to transportation.

01 19 Wholesaling (General/Miscellaneous) NEC -- Organized subject matter and learning experiences--not listed or classifiable in other major categories--related to the sales and sales-supporting tasks performed by employees and management of places of business engaged primarily in selling goods to retailers, to industrial, commercial, institutional, or professional users, or bringing buyer and seller together.

01 99 Other Instructional Programs (Specify) -- Include here other organized subject matter content and learning experiences, not listed or classifiable above, emphasized in marketing functions performed by employees and/or managers of establishments engaged in selling products or providing services to individuals and business establishments.

## HEALTH OCCUPATIONS

07.00 00

Education for health occupations comprises the body of related subject matter, or the body of related courses, and planned experiences designed to impart knowledge and develop understandings and skills required in the supportive services to the health professions. Instruction is organized to prepare pupils for the occupational objectives concerned with assisting qualified personnel in providing diagnostic, therapeutic, preventive, restorative, and rehabilitative services to people, including understandings and skills essential to care and health services to patients.

Education for health workers is conducted by recognized education agencies with the cooperation of appropriate health institutions and services that can make available the quality and kind of experiences needed by the trainee in developing the competencies required for his occupational goal.

Instructional programs which prepare persons for occupations that render health services directly to patients (people) provide planned clinical instruction and experience in appropriate clinical situations. For those occupations that render health services which do not involve direct services to patients, planned instruction and experience in laboratories and/or appropriate work situations are provided as an integral part of the instructional program.

Included under this heading are items of information which describe selected aspects of education for health occupations. In the ensuing definitions the term "subject matter" includes theoretical course content that may be given either in a school or in a clinical setting, and the term "experiences" includes the applied course content which is provided in a clinical setting.

01 00 Dental Services -- Included in this category are occupations concerned with supportive services to the dental profession.

01 01 Dental Assistant -- A combination of subject matter and experiences designed to prepare a person to assist the dentist at the chairside in the dental operatory, to perform reception and clerical function and to carry out selected dental laboratory work.

01 02 Dental Hygientist -- A combination of subject matter and experience designed to prepare a person to provide services to patients such as performing complete oral prophylaxis, applying medication, and providing dental health education services, both for chairside patients and in community health programs, under the supervision of the dentist.

01 03 Dental Laboratory Technician -- A combination of subject matter and experiences designed to prepare a person to execute the work in producing restorative appliances required for the oral health of the patient as authorized by the dentist.

02 00 Medical Services -- Included in this category are occupations concerned with supportive services to the medical professional.

02 03 A Medical Laboratory Assistant --

02 03 B Medical Technician -- A combination of subject matter and experiences organized to prepare a person to work under the supervision of medical technologists, clinical pathologists, or physicians to perform routine clinical laboratory procedures.

02 04 Registered Nurse -- A combination of general and nursing education and clinical experiences designed to prepare the person to work with the nurse supervisor, the physician, and other members of the health team in providing nursing care.

02 05 Licensed Vocational Nurse -- A combination of subject matter and supervised clinical experiences designed to prepare a person to give direct nursing care under the supervision of a nurse or physician.

02 06 A Hospital Attendant--

02 06 B Nurses' Aide -- A combination of subject matter and experiences which prepares a person to perform simple tasks involved in the personal care of individuals receiving nursing services. These tasks are performed under the supervision of a nurse.

02 09 Inhalation Therapy Technician -- Preparation includes a combination of subject matter and experiences designed to prepare a person to perform procedures and operate and maintain equipment used in supporting respiratory functions, including the administration of oxygen and other sustaining gases, as directed by a physician.

02 11 X-ray Technician -- A combination of subject matter and experiences designed to prepare a person for the safe use of X-ray equipment in both laboratory and clinical settings under the supervision of a radiologist or other physician.

02 12 Optical Technician -- A combination of subject matter and experiences designed to train a person to prepare, assemble, and fit corrective lenses as prescribed by a physician or optometrist.

02 13 Surgical Technician -- A combination of subject matter and experiences designed to prepare a person to serve as a general technical assistant on the surgical team in the operating suite.

HOME ECONOMICS

09.00 00

Home Economics comprises the group of related courses or units of instructio organized for purposes of acquiring knowledge and developing understandings, attitudes, and skills relevant to (a) personal, home and family life, and (b) occupational preparation using the knowledge and skills of home economics. The subject matter of home economics includes, in addition to content unique to the area, concepts drawn from the natural and social sciences and the humanities. The following descriptive headings identify the various aspects of home economics

01 00 Homemaking: Preparation for Personal, Home, and Family Living -- The courses or units of instruction in home economics emphasizing acquisition of knowledge and development of understandings, attitudes, and skills relevant to personal, home, and family life in the areas described below.

01 01 Comprehensive Homemaking or Home Economics -- Instruction which derives content from a combination of the various areas of homemaking (as described by the items listed below) and emphasizes basic principles and interrelationships among these areas.

01 02 Child Development -- The study of children--their physical, mental, emotional, and social growth and development--and their care and guidance. In practice, subject matter content draws on aspects of the social and biological sciences.

01 03 Clothing and Textiles -- The study of clothing and textiles, including the significance of these to the individual and family, and the nature, acquisition, and uses of textiles and clothing products. The course content usually provides for planned experiences in the selection, construction, maintenance and alteratio of clothing and other textile products.

01 04 Consumer Education -- (See Consumer Education under SOCIAL SCIENC SOCIAL STUDIES. Emphasis in home economics will be on consumer education as it relates to management of a home and to the welfar of family members.)

01 05 Family Health -- The study of related aspects of health in family living with special emphasis being given to nutrition, creative homemaking, and emotional health, the relationship of the health of an individual to the well-being of the family, the prevention of illness, and the management involved in caring for the ill and convalescent in the home.

01 06 Family Relations -- The study of the nature, functions, and significance of human relationships in the family. The subject matter content includes concepts and principles related to varied family living conditions, the establishment and maintenance of relationships, and the preparation for marriage and family life. These

designated aspects of family relationships emphasize the universality of families, the uniqueness of individuals and families, the development and socialization of the individual, and meeting the variety of needs and interests of family members.

01 07 Foods and Nutrition -- The study of food and its role in personal and family living, including the basic principles of health, food management, and economics. In practice, emphasis is frequently placed on meal management as a means to understanding the significance of food and the nature of food and its preparation for individuals and families.

01 08 Home Management -- The study of the complexities and processes involved in formulating goals, making decisions, and effectively using and controlling human and other resources for establishing and maintaining a home and family. The subject matter content provides for a variety of home management considerations, such as the societal and economic influences on individual and family management, values, goals, and standards, family economics, and the organization of activities in the home.

01 09 Housing and Home Furnishings -- The study which is designed to develop judgment needed for creating a favorable environment for family living. Attention is given to a complex of housing and home furnishing factors including influence of housing on people; types and costs of housing; interior design; the care, maintenance, and improvement of homes and furnishings; and the relation of resources to family needs.

01 99 Other Homemaking -- Include here other organized subject matter content emphasized in homemaking and which is not listed above. (Specify)

02 00 Gainful Employment Education Related to Home Economics -- This educational program is distinct from that one which prepares persons for homemaking. Its distinctness lies in the use of the subject matter and skills inherent in the various areas of home economics to train persons in a selected specialized spectrum of subject matter and skills which will enable them to be employable on certain jobs which demand the knowledge and skills found in the particular home economics subject matter area. Subject matter knowledge and skills are coordinated with appropriate field, laboratory, and work experience. Occupations for which programs of gainful employment education related to home economics can prepare persons tend to be those in the service jobs to individuals, families, and institutional groups.

02 01 Care and Guidance of Children -- Preparation for employment in children's centers and nursery schools. High school programs prepare youth to fulfill entry-level jobs as assistants to nursery school teachers; junior college courses prepare people to serve as teachers or assistant teachers in children's centers.

02 02 Clothing Management, Production, and Services -- Preparation for employment in entry-level jobs, particularly in the selling of clothing, fabrics, notions, patterns; training to enable a person to serve as an assistant to a dressmaker; training to enable a person to perform entry-level jobs in laundry and dry-cleaning establishments.

02 03 Food Management, Production, and Services -- Preparation for a variety of entry-level jobs in institutional and commercial food services. These will include entry-level workers and supervisory workers in hospitals, children's centers, homes for the elderly, school lunch programs, commercial food service operations.

02 04 Home Furnishings, Equipment, and Services -- Preparation for entry-level employment in selling home furnishings and/or equipment; in custommaking of curtains, draperies, slipcovers, and other related items.

02 05 Institutional and Home Management and Supporting Services -- Preparation of persons for entry-level employment in such positions as homemaker's assistant; hotel and motel maids; nurses' aides, home health aides, and any other entry-level positions which fall in this category.

02 99 Other Occupational Preparation -- Aspects of preparation for gainful employment at the entry and/or promotional levels. Promotional level employment can receive training at the junior college and/or adult education level.

99 00 Other (Specify) -- Preparation for gainful employment that cannot be classified in any of the items 02 00 through 02 99, particularly that for persons with special needs, and, ancillary purposes in the development and supervision of gainful employment education related to home economics.

## OFFICE OCCUPATIONS

## 14.00 00

The body of subject matter, or combinations of courses and practical experience, organized into programs of instruction to provide opportunities for pupils to prepare for and achieve career objectives in selected office occupations. In the instructional process substantive content frequently is comprised of subject matter drawn from other subject matter areas. Learning experiences are designed to lead to employment and/or advancement of individuals in occupations in public or private enterprises or organizations related to the facilitating function* of the office. Included is a variety of activities, such as recording and retrieval of data, supervision and coordination of office activities, internal and external communication, and the reporting of information. Under this heading are the items of information which identify categories of career objectives in office occupations, and around which courses and practical experiences are developed.

01 00 Accounting and Computing -- Planned learning experiences which include a combination of courses and practical experiences concerned with systematizing information about transactions and activities into accounts and quantitative records, and paying and receiving money. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Junior Accountants, Bookkeepers, Cashiers, Machine Operators, Tellers, and Other Accounting and Computing occupations.

02 00 Business Data Processing Systems -- Planned learning experiences which include a combination of courses and practical experiences concerned with business data processing systems and operations. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Computer and Console Operators, Peripheral Equipment Operators, Programmers, Systems Analysts, and Other Business Data Processing Systems Occupations.

03 00 Filing, Office Machines, and General Office Clerical -- Planned learning experiences which include a combination of courses and practical experiences concerned with the recording and retrieval of data, including classifying, sorting, filing, correspondence, records, and other data. Career objectives are identified with a variety of occupational groups and specialization (as indicated in the Dictionary of Occupational Titles), such as Duplicating Machine Operators, File Clerks, General Office Clerks, and Other Filing, Office Machines, and General Office Clerical Occupations.

04 00 Information Communication -- Learning experiences which include a combination of courses and practical experiences concerned with the distribution of information, e.g., by mail, telephone, telegraph, and in person. Career objectives are identified with a variety of occupational groups, (as indicated in the Dictionary of Occupational Titles), and specialization such as Communication Systems Clerks and Operators, Correspondence Clerks, Mail and Postal Clerks, Mail-preparing and Mail-handling Machine Operators, Messengers and Office Boys and Girls, Receptionists and Information Clerks, and Other Information Communication Occupations.

* "Facilitating function," as used in Office Occupations Education, refers to the expediting role played by office occupations as the connecting link between the production and distribution activities of an organization.

05 00 Materials Support Occupations: Transporting, Storing, and Recording -- Planned learning experiences which include a combination of courses and practical experiences concerned with (1) receiving, storing, issuing, shipping requisitioning, and accounting for stores of material or material in use; (2) assigning locations and space to items, including verification of quality, identification, condition and value; (3) the physical handling of items, including binning, picking, stacking, and counting; (4) preparing or committing stocks for shipment; (5) inventorying stock; (6) replenishing depleted items; and (7) filling orders, and issuing tools, equipment, or materials to workers. Career objectives are identified with a variety of occupational groups and specializations, (as indicated in the Dictionary of Occupational Titles), such as Planning and Production Clerks, Shipping and Receiving Clerks, Stock and Inventory Clerks, Traffic, Rate, and Transportation Clerks, and Other Transporting, Storing, and Recording Occupations.

06 00 Personnel, Training, and Related -- Planned learning experiences which include a combination of courses and practical experiences concerned with personnel administration of an organization and the facilitating functions of scheduling and conducting clerical work and management and operations of organizations. Career objectives are identified with a variety of occupational groups and specialization (as indicated in the Dictionary of Occupational Titles), such as Educational and Training Assistants, Interviewers and Tests Technicians, Personnel Assistants, and Other Personnel, Training, and Related Occupations.

07 00 Stenographic, Secretarial, and Related -- Planned learning activities which include a combination of courses and practical experiences concerned with making, classifying, and filing records, including written communications. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Executive Administrative Secretary, Secretaries, Stenographers, and other Stenographic, Secretarial, and Related Occupations.

08 00 Supervisory and Administrative Management -- Learning activities and experience concerned with a variety of responsibilities such as (1) studying policies, organizational structures, and administrative practices of such organizations as governmental units, industrial firms, and nonprofit groups; (2) reviewing periodic budgets submitted by operations personnel; (3) preparing reports summarizing findings, and recommending changes in policy, organization, and administration to line management; (4) consolidating the budget estimates and preparing financial reports for consideration and action by upper echelons of management; and (5) supervising and coordinating activities, determining work procedures, and assigning duties. (D.O.T. No.____)

09 00 Typing and Related -- Planned learning activities which include a combination of courses and practical experiences concerned with recording data, supervising and administering typing staffs and typing, and managing offices. Career objectives are identified with a variety of occupational groups and specialization, (as indicated in the Dictionary of Occupational Titles), such as Clerk Typists, Key Punch and Coding Equipment Operators, Typists, and Other Typing and Related Occupations.

10 00 Miscellaneous Office (Specify) -- Planned learning experiences (not elsewhere classified) which include a combination of courses and practical experiences concerned with the facilitating functions, e.g., public contact such as registering hotel and motel guests, examining claims and records, and collecting and tracing accounts. Career objectives are identified with a variety of occupational groups and specialization (as indicated in the Dictionary of Occupational Titles), such as Collectors, Hotel Clerks, Clerical Technicians, Credit Clerks, and other occupations and areas of specialization concerned with office occupations not listed or classifiable in the above categories, including emerging office occupations not classifiable in the above categories. (list D.O.T. Nos.)

99 00 Other, NEC (Specify)

9901 Electronic Manufacturing

TECHNICAL

16.00 00

Technical Education is concerned with that body of knowledge organized in a planned sequence of classroom and laboratory experiences usually at the post-secondary level preparing students for a cluster of job opportunities in a field of technology. It requires a knowledge of mathematics, the sciences associated with the technology; an understanding of the methods, skills, materials, and processes commonly used in the technology; an extensive knowledge of a field of specialization; and sufficient depth in the basic communication skills and related general education topics. Technical education prepares for the occupational area between the skilled employee and the professional employee such as the doctor, the engineer, the scientist; and is on the continuum nearest to the professional employee.

The technical curriculum must be so structured so that it prepares the graduate to enter a job and be productive with a minimum of additional training after employment to provide him with a background which will enable him to advance with the developments in the technology, and to enable him with a reasonable amount of experience and additional education to advance into positions of increased responsibility.

The technician is usually employed in direct support of the professional employee. For example, the engineering technician will be capable of performing such duties as designing, developing, testing, modifying of products and processes, production planning, writing reports, preparing estimates; analyzing and diagnosing tehcnical problems that involve independent decisions, and solving a wide range of technical problems by applying his background in the technical specialties--mathematics, science, and communicative skills.

01 00 Engineering Related Technology -- Engineering related technology is that part of the engineering field which requires the application of scientific and engineering knowledge and methods combined with technical skills in support of engineering activities. Persons prepared in this technology are a part of the engineering manpower team which includes the skilled craftsman, the technician, and the engineer, and work as technicians in close support of the engineer.

01 01 A Aernoautical Technician --

01 01 B Aero-Space Technician --

01 01 C Aircraft Design and Construction -- A planned program of classroom and laboratory experiences, including mathematics, the physical sciences, and a combination of aerodynamics, structures, materials, and electronics as applied to the design, testing, and development of aircraft. This program is designed to produce the ability to understand the propulsion, control and guidance system of the airplane and to collect pertinent engineering data in a research and development activity. This program prepares the graduate to work in direct support of the engineer in the aerospace industry.

01 03 Construction Technician -- A program of instruction designed to provide the pupil with knowledge and understandings of scientific principles, mathematical concepts, and communicative and technical skills combined with laboratory experiences including creative design, testing, and model building which will enable him to be supportive to the architect and the architectural engineer. The subject matter emphasizes design, estimating, inspection, supervision, and contracts and specifications primarily in the field of building construction with attention to the art of form.

01 04 Automotive Technician -- A sequence of classroom and laboratory experiences which includes mathematical and scientific principles leading to an understanding of the design, development, and testing of internal combustion engines and related component parts of the motor vehicle including transmissions, electrical systems, and braking systems. This program enables the graduate to perform duties concerned with designing, testing, and development in direct support of the automotive engineer.

01 05 Chemical Laboratory Technician -- A program of instruction designed to provide the pupil with scientific principles, mathematical concepts, and communicative and technical skills combined with appropriate laboratory experiences which will enable him to be supportive to the chemical engineer. The subject matter content emphasized qualitative, quantitative, and analytical analyses in general and organic chemistry. In the unit operation laboratory he studies material handling, crushing, grinding, and sizing. By pilot plant operation he studies the chemical machinery and methods used in extraction, distillation, evaporation, drying, absorption, and heat transfer. He designs, installs, and operates pilot plants for chemical manufacturing processes.

01 06 A Chainman, Axmen, Rodmen --

01 06 B Civil Technician --

01 06 C Surveyor -- A planned program of classroom and laboratory experiences including the study of mathematics, physical sciences, surveying, strength of materials, and other specialty courses leading to preparation for designing, testing, and supervising the construction of highways, railroads, airports, bridges, harbors, irrigation works, sanitary plants, and structures. The graduate works in direct support of the civil engineer.

01 07 Electrical Technician -- An organization of subject matter and laboratory experiences designed to provide preparation in specialty courses, physical sciences, mathematics and general education as applied to the design, development, and testing of electrical circuits, devices and systems for generation, distribution and utilization of electrical power. These electrical systems incorporate the knowledge and application of electronic and instrumentation devices.

The program is designed to produce the capacity to perform in such areas as: model and prototype development and testing; systems analysis and integration including design, selection, installation, calibration, and testing; development of corrective and preventive maintenance techniques; application of engineering data; and the preparation of reports and test results in support of the electrical engineer.

01 08 Electronics Technician -- Subject matter and laboratory experiences organized to provide preparation in the speciality courses, physical science, mathematics, and general education concerned with the design, development and testing of electronic circuits, devices and systems. Content incorporates solid state and microminiturzation devices and representative systems such as: Microwave systems, computers, and controls.

The program is designed to produce the capacity to perform in such areas as: practical circuit feasibility, prototype development and testing, development of maintenance techniques, systems analysis including design, selection, installation, calibration and testing; application of engineering data and preparation of reports and test results in support of the professional personnel in the electronics field.

01 09 A Automated Equipment Technician --

01 09 B Electro-Mechanical Technician -- A selection and integration of specialized classroom and laboratory learning experiences in both the mechanical and electrical fields. Instruction is planned to provide preparation concerned with design, development, and testing of electro-mechanical devices and systems such as automatic control systems and servomechanisms including vending machines, elevator controls, missile controls, tape control machines, and auxiliary computer equipment.

The program of instruction is designed to develop understandings, knowledge, and skills which will provide the capacity to perform effectively in such areas as: feasibility testing of engineering concepts; systems analysis, including design, selection, and testing; application of engineering data; and the preparation of written reports and test results in support of mechanical and electrical engineers.

01 11 A Industrial Materials Tester --

01 11 B Industrial Technician --

01 11 C Production Control --

01 11 D Production Processes Technician -- A program of instruction designed to develop knowledge and understandings of scientific principles, mathematical concepts, and communicative and technical skills, combined with appropriate laboratory experiences

which will prepare the pupil to be supportive to the industrial engineer in production and planning. The subject matter content emphasizes design and installation of integrated systems of materials, machinery, equipment, and personnel.

01 12 Instrumentation Technician -- A sequence of classroom and laboratory experiences supported by mathematics and physical sciences which will provide an understanding in the fields of electricity, electronics, mechanics, pneumatics, and hydraulics as they pertain to the applications of the principles of control and recording systems and automated devices. The program is designed to prepare the pupil to design, develop prototypes, and test and evaluate control systems or automated systems and to prepare graphs, written reports, and test results in support of the professional personnel working in the field of instrumentation.

01 13 A Engineering Aide --

01 13 B Engineering Technician --

01 13 C Laboratory Technician --

01 13 D Mechanical Technician -- A program of instruction designed to develop knowledge and understandings concerning scientific principles, mathematical concepts, and communicative skills, combined with appropriate laboratory experiences which will prepare a pupil to become supportive to the machanical engineer.

01 15 Nuclear Technician -- A combination of subject matter and experiences designed for the study of scientific principles, mathematical concepts, and communicative and technical skills which, when combined with appropriate laboratory situations, prepare the pupil to be supportive to professionals engaged in developing, manufacturing, testing, research, maintaining, storing and handling materials in the nuclear science and energy field. The subject matter content emphasizes nuclear physics, radioisotopes, chemistry electronics, nuclear instrumentation, and safety procedures. Graduates may enter and develop in this field as reactor technicians, radiation safety technicians, and radioactive materials technician.

01 16 A Petroleum Processor (Liquid Petroleum Gas Distribution and Handling) --

01 16 B Petroleum Processor (Mud Control) --

01 16 C Petroleum Processor (Oil Well Drilling) --

01 16 D Petroleum Processor (Oil Well Production) --

01 16 E Petroleum Processor (Pump Plant Operation) --

01 16 F Petroleum Technician -- A planned program of classroom and laboratory experiences which include mathematics, chemistry, physics,

petrology, sedimentation, and geophysics as applied to the recovery and use of oil and gas. Instruction leads to preparation for: oil field exploration; supervision of rig construction, drilling, oil field services, crude petroleum production, and petroleum refining; and work in direct support of the engineers and geologists in the oil industry.

01 18 Machine Control

01 19 Photo Optics Technician

01 99 Other Related Technology (Specify) -- Include here other organized subject matter and experiences emphasized in engineering related technology which are not classifiable or listed above, e.g., ceramics engineering technology, marine engineering technology, and mining engineering technology.

05 00 Other Technical Education, NEC -- Examples of other aspects of technical education which may be classified in selected categories above, as appropriate, or here if not appropriate to one of the above categories, are: (Specify)

05 01 A Sewage Treatment Operator

05 01 B Water and Wastewater Technician

05 02 Airplane Pilot

05 04 Forestry and Lumbering

05 07 Library Technician

05 08 Orthopedic Technician

05 09 Technical Report Writer

05 10 Time and Motion Study

05 11 Welding Technician

2306 A Sheet Metal Welding
2306 B Welding
2306 C Welding -- Acetylene
2306 D Welding -- Arc
2306 E Welding -- Arc and Acetylene
2306 F Welding -- Heliarc
2307 A Asbestos and Insulation Worker
2307 B Insulation Worker
2308 Metal Polishing
2309 Plate and Structural Layout
2310 Boilermaking
2399 Other Metalworking Occupations (Specify)

2400 Metallurgy Occupations

2600 Personal Services

2601 Barbering
2602 Cosmetology
2603 Fashion Model
2604 Hotel Management
2699 Other Personal Services (Specify)

2700 Plastics Occupations

2701 Aircraft Plastics
2702 Plastics -- Fabricating

2800 Public Service

- 2801 Fire Science
- 2802 A Law Enforcement
- 2802 B Police Science
- 2803 Nursery School Assistant
- 2899 Other Public Services (Specify)

2900 Quantity Food Occupations

- 2901 Baker
- 2902 Cook
- 2903 Meat Cutter
- 2904 Waiter/Waitress
- 2905 Restaurant Management
- 2999 Other Quantity Food Occupations (Specify)

3000 Refrigeration

3100 Small Engine Repair (Internal Combustion)

3300 Textile Production and Fabrication

- 3301 A Dressmaking and Design
- 3301 B Millinery
- 3302 Tailoring
- 3303 Garment Cutting
- 3304 Power Sewing
- 3399 Other Textile Production and Fabrication (Specify)

3400 Shoe Manufacturing/Repair

3500 Upholstering

3600 Woodworking Occupations

- 3601 Mill Cabinetmaking
- 3602 Furniture Making and Refinishing

3700 Other Trades and Industry Occupations

- 3701 Auto Painting
- 3702 Auto Tire Rebuilding
- 3703 Bus Operations
- 3704 Carpetlaying
- 3705 Commercial Vehicle Operation
- 3706 Drivers and Chauffeurs (Bus-Taxi-Truck-Tractor)
- 3707 Electroplating
- 3708 Floor Laying (Linoleum)
- 3709 Gunsmithing
- 3710 Industrial Maintenance

3700 Other Trades and Industry Occupations (continued)

3711 Jewelry Engraving
3712 Leathercraft
3713 Locksmithing
3714 Millwright
3715 Office Machine Repair
3716 PBX Operation
3717 Piano Tuning
3718 Railroad (Carmen)
3719 Railroad Car Construction
3720 Railroad Mechanics
3721 Stagecraft
3722 Teletyping
3723 Tool Design
3724 Typewriter Repair

## TRADES AND INDUSTRY

17.00 00

Trades and industrial occupations is the branch of vocational education which is concerned with preparing persons for initial employment or for upgrading or retraining workers in a wide range of trades and industrial occupations. Such occupations are skilled or semi-skilled and are concerned with producing, processing, assembling, testing, maintaining, servicing, or repairing any product or commodity. Instruction is provided in (1) basic manipulative skills, safety judgment, and related occupational information in mathematics, drafting, and science required to perform successfully in the occupation, and (2) through a combination of shop or laboratory experiences simulating those found in industry and classroom learning. Included is instruction for apprentices in apprenticeable occupations or for journeymen already engaged in a trade or industrial occupation. Also included is training for service and certain semiprofessional occupations considered to be trade and industrial in nature.

01 00 Air Conditioning -- Classroom and shop learning experiences which enable the student to become proficient in the installation, repair, and maintenance of commercial and domestic air conditioning systems. Included is learning in the theory and application of basic principles of conditioning of air: cooling, heating, filtering, and controlling humidity; the operating characteristics of various units and parts; blueprint reading; the use of technical reference manuals; the diagnosis of malfunctions; the overhaul, repair, and adjustment of units and parts such as pumps, compressors, valves, springs, and connections; and repair of electric and pneumatic control systems.

01 01 Cooling -- Learning experiences specifically concerned with the installation, operation, testing, and trouble shooting of various types of air cooling equipment and of the controls needed for operation.

01 02 Heating and Ventilating -- Learning experiences specifically concerned with the installation, operation, testing, and trouble shooting of various types of heating equipment and of the controls needed for operation.

02 00 Appliance Repair -- Classroom and shop learning experiences concerned with the theory of electrical circuitry, simple gearing, linkages, and lubrication in the operation, maintenance, and repair of components including relays, time switches, pumps, and agitators used in appliances such as washers, dryers, vacuum cleaners, toasters, water heaters, and stoves. Related training is provided in the use of familiar tools, test equipment, and service manuals and in making cash estimates for repairs.

02 01 Gas Appliance Control Repair

02 02 Household Appliance Repair

03 00 Automotive Industries -- Classroom and shop learning experiences which include training in all phases of automotive maintenance repair work on all types of automotive vehicles. Includes training in the use of technical manuals and a variety of hand and power tools. Instruction and practice is provided in diagnosis of malfunctions, disassembly of units, parts inspection and repair or replacement of parts and includes engine overhaul and repair, ignition systems, carburetion, brakes, transmissions, front end alignment, and installation of a variety of accessories such as radios, heaters, mirrors, and windshield wipers.

03 01 Auto Body Repair -- Specialized learning experiences concerned with all phases of the repair of damaged bodies and fenders including metal straightening by hammering, smoothing areas by filing, grinding or sanding, concealment of imperfections, painting, and replacement of body components including trim.

03 02 A Auto Carburetion --

03 02 B Auto Mechanic --

03 02 C Auto Motor Tune-Up --

03 02 D Auto Service Station Mechanic -- Learning experiences concerned with the components of the vehicle, including engine, power transmission, steering, brakes, and electrical systems. Included is training in the use of diagnostic and testing equipment and tools in the repair process.

03 03 A Auto Electrics --

03 03 B Auto Machine Shop --

03 03 C Automatic Transmissions --

03 03 D Auto Trimming --

03 03 E Auto Wheel Alignment and Brakes -- Learning experiences which involve more detailed training in the adjustment and repair of the automobile, including the radiator, transmission carburetor, brake system, and other units to provide greater proficiency in the servicing of selected components.

03 04 Auto Parts

03 05 Service Station Attendant

03 99 Other Automotive Industries -- Include here other organized subject matter content and learning experiences emphasized in automotive industries which are not listed or classifiable above. (Specify)

04 00 Aviation Occupations -- Classroom and practical experiences which include instruction relating to aircraft maintenance, aircraft operation, and ground support.

04 01 A Aircraft Assembly --

04 01 B Aircraft and Engine Mechanics --

04 01 C Aircraft Materials and Processes --

04 01 D Aircraft Mechanics -- Classroom and shop learning experiences concerned with the inspection, repair, servicing, and overhauling of all airplane parts including engines, propellers, instruments, airframes, fuel and oil tanks, control cables, and hydraulic units. Involves learning the use of tehcnical manuals and various kinds of testing equipment.

04 02 Aircraft Navigation -- Classroom and practical experiences concerned with the in-flight operation of commercial planes including piloting, navigating, and passenger services, e.g., flight engineer, pilot, and stewardess training.

04 04 Airplane Stewardess

05 00 Blueprint Reading -- Classroom and practical experiences concerned with visualizing, preparing, developing, and interpreting blueprints. Included are the study of principles of sketching and drawing objects or structures; understanding, and utilizing symbols, plans, sections, and details for communicating through blueprints; interpreting blueprints and their related specifications, and then translating them into actuality.

07 00 Commercial Art Occupations -- Organized specialized learning experiences which include theory and laboratory and shop work as they relate to the design and execution of layouts and making illustrations for advertising, display, and instructional manuals. Instruction includes advertising theory and preparation of copy, lettering, poster design, fashion illustration, silk screen, air brush and touch-up, inks and color dynamics, package and product design, drawings for line and halftone reproduction, and other display devices and exhibits. Instruction leads to preparation for various types of employment such as fashion illustrator, technical illustrator, interior decorator, and advertising artist.

07 01 Commercial Art

07 02 Costume Designing

07 03 Sign Painting

07 04 Stage-Scenery Designing

07 05 Technical Illustration

08 00 Commercial Fishery Occupations -- Organized specialized learning experiences which include theory and laboratory and shop work as they relate to seamanship, navigation, and communications; utilization of rigging and other equipment; maintenance and repair of boats; techniques for finding fish; shipboard preservation and refrigeration; processing catches afloat and on shore; and operation and maintenance of all fishing gear and power plants. Instruction leads to preparation for various types of employment such as fisherman, processor, weigher, and equipment and special gear maintenance man.

09 00 Commercial Photography Occupations -- Organized specialized learning experiences which include theory and laboratory and studio work as each relates to all phases of camera uses and photographic processing. Instruction includes composition and color dynamics, contact printing, and enlarging; developing film; air brush and retouching, coloring, and copying; utilization of cameras, meters, and other photographic equipment; portrait, commercial, and industrial photography, including such processes as microfilming and preparing copy for other printing and graphic arts processing.

Instruction also emphasizes the development of skills and knowledge essential for employment in planning, developing, and producing in such areas as audiovisual materials and telecasting, and for employment as a commercial photographer, air brush man, camera man (offset printing), audiovisual projectionist, and camera man (broadcasting).

09 01 Cinematography

09 02 Photography

10 00 Construction and Maintenance Trades -- Classroom and shop learning experiences concerned with the erection, installation, maintenance or repair of buildings, highways, airports, missile sites, and earth and other structures using assorted materials such as metal, wood, stone, brick, glass, concrete, or composition substances. Instruction is provided in a variety of activities such as cost estimating; cutting, fitting, fastening, and finishing; in the use of a variety of hand and power tools; and in blueprint reading and following technical specifications. Knowledge is provided concerning the physical properties of the materials.

10 01 A Carpentry --

10 01 B Carpentry and Mill Cabinet --

10 01 C Floor Laying (Hardwood) -- Classroom and shop learning experiences involving layout, fabrication, assembly, installation, and repair of structural units. Included is instruction in the care and use of hand or power tools, equipment and materials; common systems of frame and sound construction; and drafting, blueprint reading, applied mathematics, and materials estimating.

10 03 A Heavy Duty Equipment Repair --

10 03 B Operating Engineering -- Classroom and practical work experiences concerned with the operation, maintenance, and repair of heavy-duty equipment such as bulldozers, cranes, graders, tractors, concrete mixers, crawler-mounted shovels, trailer-mounted compressers, and the gasoline or diesel engines powering the equipment.

10 04 A Bricklaying --

10 04 B Cement Finishing --

10 04 C Tilesetting -- Specialized classroom and shop experiences concerned with the cutting, chipping, and fixing in position of concrete blocks, brick, and glass blocks using bonding materials and hand tools. Included is training in reading architectural plans, planning, and estimating.

10 05 A Interior Decorating --

10 05 B Painting and Decorating --

10 05 C Paperhanging -- Specialized classroom and shop learning experiences concerned with the preparation and finishing of exterior and interior surfaces by the application of protective or decorative coating materials such as lacquer, paint, and wallpapers. Includes instruction in scraping, burning, or sanding surfaces; making, mixing, and matching paints and colors, applying coating with brush, roller, or spray-gun, or by cutting, pasting and hanging wallpaper.

10 06 A Lathing --

10 06 B Plastering -- Specialized classroom and shop learning experiences concerned with the application of plaster, stucco, and similar materials to interior and exterior surfaces of structures. Instruction includes the preparation of surfaces and the smoothing and finishing of them.

10 07 A Plumbing --

10 07 B Sprinkler Fitting --

10 07 C Steam Fitting -- Specialized classroom and shop learning experiences concerned with layout assembly, installing, altering and repairing piping systems, and related fixtures and fittings in structures by the use of pipe-cutting, bending, and threading tools; welding, soldering, and brazing equipment; and other hand and power tools and equipment.

10 08 A Building Code

10 08 B Building Estimating

10 08 C Building Inspection

10 09 Glazing

10 10 Roofing

10 11 Strength of Material (Steel)

10 12 Structural and Ornamental Metal Work

10 99 Construction Occupations (N.E.C.) -- Include here other subject matter content and learning experiences emphasized in construction and maintenance trades which are not listed or classifiable above. (Specify)

11 00 Custodial Services -- Classroom and shop learning experiences which are concerned with all phases of care and cleaning of buildings, fixtures, and furnishings, including all types of building interiors such as linoleum, plastic, terrazzo, tile, and wood floors; rugs; and plastic, wood panel, paint, and synthetic wall coatings. Skills are taught in the use and care of hand and power tools for such operations as dusting, dust mopping, wet mopping, scrubbing, waxing, and refinishing, and the cleaning of toilet rooms, windows, and walls.

Additional emphasis are placed on (1) characteristics of various cleaning agents and protective coatings--including their reactions on surfaces--and procedures for applying them; (2) sanitation and disinfectants, (3) scheduling work, and (4) purchasing custodial supplies.

11 01 A Custodian

11 01 B Janitor

12 00 Diesel Mechanic -- Classroom and shop learning experiences which are concerned with all phases of repair work on diesel engines used to power buses, ships, trucks, railroad trains, electric generators, construction machinery, and similar equipment. Instruction and practice is provided in diagnoses of malfunction; disassembly of engines; examination of parts; reconditioning and replacement of parts; repair and adjustment of fuel injection systems, oil and water pumps, generators, governors, auxiliary and accompanying power units, controls, and transmissions. The uses of technical manuals, a variety of hand and power tools, and testing and diagnostic equipment are also studied.

12 01 A Diesel Mechanic

12 01 B Railroad (Diesel)

13 00 Drafting Occupations -- Organized specialized learning experiences which include theory, use of drafting room, laboratory and shop work as each relates to the gathering and translating of data or specifications, planning, preparing, and interpreting mechanical, architectural, structural, pneumatic, marine, electrical/electronic, topographical, and other drawings and sketches. Instruction includes experiences with drawing reproduction materials, equipment, and processes; the preparation of reports and data sheets for specifications writing; the development of plan and process charts and drawings; and model development.

Instruction emphasizes the development of skills and knowledge essential for employment in ancillary capacities such as tracers or reproduction equipment operators, and for occupations such as mechanical draftsman, structural draftsman, detailer marine draftsman, tool designer, fixture designer, and punch and die designer.

13 01 Drafting -- Aircraft

13 02 Drafting -- Architectural

13 03 Drafting -- Civil

13 04 Drafting -- Electronic

13 05 Drafting -- Marine

13 06 Drafting -- Mechanical

13 07 Lofting and Template Layout

13 08 Tailoring Pattern Drafting

14 00 Electrical Occupations -- Organized subject matter and experiences which include theory, laboratory, and shop work as each relates to planning functions, generating and transmitting electricity, installing and maintaining electrical and communications systems, and equipment and components. Instruction emphasizes practical applications of mathematics, the sciences, circuit diagrams and blueprint reading, sketching, and other subjects essential to preparation for employment in the electrical occupations.

14 01 A Electrician --

14 01 B Electric Code --

14 01 C Electricity for Telephone Servicemen -- Specialized classroom and practical instruction related to the maintenance and repair of a variety of industrial machinery driven by electric motors or which are electrically controlled.

14 02 Electric Linemen -- Specialized classroom and practical experiences concerned with the installation, operation and maintenance of local, long-distance and rural lines, including pole- and tower-line erection and construction.

14 03 Electric Motor Repair -- Specialized classroom and practical learning experiences concerned with the assembly, installation, testing, maintenance and repair of electric motors, generators, transformers, and related equipment.

14 04 Electrical Appliance Repair

14 05 Electrical Instrument Repair

14 06 Electric Cable Splicing

14 07 Electric Sign Assembly

14 99 Other Electrical Occupations -- Include here other subject matter content and learning experiences emphasized in electrical occupations which are not listed or classifiable above. (Specify)

15 000 Electronics Occupations -- Organized specialized learning experiences which include theory, laboratory, and shop work as each relates to planning, producing, testing, assembling, and installing and maintaining electronic communications equipment such as radio, radar, and television; industrial electronic equipment including digital computers, new electronic systems, components, and equipment; and control devices. Emphases are placed on solid state devices and components, electron tube characteristics, low frequency amplifiers, LC and RC Oscillators, transistors, and amplitude and frequency modulation.

Instruction is designed to develop knowledge, understandings, and skills essential for employment in communications, industrial electronics, radio/television, and other electronics occupations.

15 01 A Aircraft Electricity and Radio --

15 01 B Aircraft Electronics --

15 01 C Communication (Electronic)

15 01 D Telegrapher -- Specialized classroom and practical experiences concerned with the assembly, installation, operation, maintenance and repair of communications equipment and systems of all types, e.g. industrial and entertainment sound systems, data processing, telephone dial systems, two-way radio, central circuits, hearing aids, and high-fidelity sets.

15 03 A Radio and Electric Parts --

15 03 B Radio Operation and Broadcasting --

15 03 C Radio Operation and Code --

15 03 D Radio Repair --

15 03 E Television Service and Repair --

15 03 F Television Transmission -- Specialized theory and practice which are concerned with the construction, maintenance and repair of radios and televisions sets. Training also prepares pupils to diagnose troubles and make repairs on other electronic products such as high-fidelity sound equipment, phonographs, and tape recorders.

15 04 Electronic Computing

15 99 Other Electronics Occupations -- Include here other subject matter content and learning experiences emphasized in electronics occupations which are not listed or classifiable above. (Specify)

16 00 Fabric Maintenance Services -- Classroom and laboratory learning experiences which are concerned with all phases of maintenance service on all types of fabrics. Instruction emphasizes identifying, marking and entering, sorting, assembling, wrapping, and bagging clothing and other fabrics; a wide range of information dealing with drycleaning and spotting agents, detergents, and bleaches and dyes; effects of heat on various fabrics; skills involved in the use of hand tools and power equipment such as power presses for flat work, roller presses, washers, extractors, and dryers; and alteration and repair of fabrics.

16 01 Drycleaning -- Classroom and practical experiences concerned with theory and knowledge in drycleaning plant management and processes. Instruction includes receiving garments, inspecting, dry and wet cleaning, identifying spots and spotting, pressing, dyeing, sorting and wrapping of wearing apparel, household furnishings, and other articles of textile construction or leather. Also emphasized are experiences concerned with various cleaning agents, kind of fabrics, alteration and repair of fabrics, and uses of hand and power tools and equipment.

16 99 Other Fabric Maintenance Services -- Include here other subject matter content and experiences emphasized in fabric maintenance services which are not listed or classifiable above. (Specify)

17 00 Foremanship, Supervision, and Management Development -- Planned learning experiences designed to assist the supervisor in effectively utilizing the men, machines, and materials under his supervision by broadening his background and developing his leadership abilities. Included is the study of human behavior, organization and management, oral communication, labor laws, personnel procedures, job analysis, work simplification, employee utilization and development techniques of writing as applied to preparation of letters, memos, and technical reports, speed reading, and safety and first-aid practices.

19 00 Graphic Arts Occupations -- Organized specialized learning experiences which include theory and laboratory and shop work as they relate to all phases of hot and cold typesetting, layout, composition, presswork, and binding, including flexography, lithography, photoengraving and others related to the printing industry. Emphases are also placed on typographical layouts and design, hand and machine typesetting, camera and plate work, imposition, type casting, offset and platen press makeup and operation, paper cutting, ink and color preparation, binding, and production by silk screen process.

Instruction leads to preparation for various types of employment such as typesetter, compositor, camera man, platemaker, cost analyst, expediter, and production planner.

19 01 Graphic Artist

19 02 Printing

19 03 Printing (Bindery)

19 04 Printing (Hand Composition)

19 05 Printing (Linotype)

19 06 Printing (Offset)

19 07 Printing (Presswork)

21 00 Instruments Maintenance and Repair Occupations -- Classroom, laboratory, and practical learning experiences concerned with maintaining and repairing meters, instruments, watches and clocks, and other physical measuring devices. Instruction includes experiences in diagnosing malfunctions, disassembling, repairing and/or replacing faulty parts, cleaning, assembling and adjusting, and using special bench and hand tools meters, and standards.

21 01 Aircraft Instruments

21 02 Metrology

21 03 Watch Repair

22 00 Maritime Occupations -- Classroom, laboratory, and practical learning experiences which are concerned with maintaining and repairing mechanical equipment on fresh-water and sea-going ships, tugboats, barges, floating drydocks, and other marine craft and floating structures, as well as related harbor and dock machinery and equipment. Instruction emphasizes diagnosing malfunctions, disassembling, repairing and/or replacing parts, and assembling, adjusting, and testing the equipment. Also emphasized are the uses of a variety of hand, bench, and power tools, and testing equipment.

22 01 Shipbuilding

22 02 Ship Carpentry

22 03 Shipfitting

22 04 Marine Electrician

22 05 Marine Mechanics

22 06 Marine Navigation

22 07 Marine Pipefitting

22 08 Marine Sheet Metal

22 08 Marine Sheet Metal Layout

22 09 Marine Telephone

23 00 Metalworking Occupations -- Organized specialized learning experiences which include theory and laboratory and shop work as they relate to the planning, manufacturing, assembling, testing, and repairing of parts, mechanisms, machines, and structures in which materials are cast, formed, shaped, molded, heat treated, cut, twisted, bent, pressed, stamped, fused, marked, or worked upon.

Instruction emphasizes knowledge, skills, and understandings which lead to preparation for various types of skilled and semiskilled employment such as sheet metal man, tool maker, foundry man, welder, millwright, production machine tool operator, production molder, metal stamping operator, and metal patternmaker, as well as helper-type jobs such as materials handler, and machine clean-up man.

23 01 Foundry -- Specialized classroom and shop learning experiences designed to provide a knowledge of the theory and applications of foundry practice in ferrous and non-ferrous foundries. Instruction emphasizes foundry equipment, various sands and refractories, sand and machine molding, foundry chemistry and metallurgy, coremaking, chipping, and grinding.

23 02 A Jig and Fixture --

23 02 B Machine Shop --

23 02 C Railroad (Machine Shop) --

23 02 D Tool and Die Making -- Specialized classroom and shop learning experiences which are concerned with all aspects of shaping metal parts. Instruction involves making computations relating to work dimensions, tooling, feeds, and speeds of machining. Also emphasized is work on the bench, lathes, shapers, milling machines, grinders and drills; the use of precision measuring instruments such as layout tools, micrometers and gages; methods of machining and heat treatment of various metals; blueprint reading; and the layout of machine parts. Preparation prepares the pupil to operate and repair all machines.

23 04 Metal -- Specialized learning experiences designed to prepare an all-around metal worker capable of fabricating and assembling a variety of products in many industries. Instruction includes layout; sequence of operations; setting up and operating fabricating machines; positioning, aligning, fitting, and welding parts together; and designing and constructing templates and fixtures.

23 05 A Aircraft Sheet Metal --

23 05 B Railroad (Sheet Metal) --

23 05 C Sheet Metal -- Specialized classroom and shop learning experiences which are concerned with the layout, fabrication, erection or installation, and maintenance of items made of steel, cooper, stainless steel, and aluminum such as ventilating, air conditioning and heating ducts, kitchen equipment, signs, furniture, and skylights. Instruction includes the use of hand tools and machines such as cornice brake, forming rolls, and squaring shears; drafting; and blueprint reading.

23 06 A Sheet Metal Welding --

23 06 B Welding --

23 06 C Welding -- Acetylene --

23 06 D Welding -- Arc --

23 06 E Welding -- Arc and Acetylene --

23 06 F Welding -- Heliarc -- Specialized classroom and shop learning experiences which are concerned with all types of metal welding, brazing, and flame cutting. Instruction emphasizes properties of metals, blueprint reading, electrical principles, welding symbols, and mechanical drawing.

23 08 Metal Polishing

23 09 Plate and Structural Layout

23 10 Boilermaking

23 99 Other Metalworking Occupations -- Include here other organized subject matter content and learning experiences emphasized in metalworking occupation which are not listed or classifiable above. (Specify)

24 00 Metallurgy Occupations -- Classroom and laboratory learning experiences concerned with assisting in examining and testing metal samples under the direction of physical metallurgists for determining the physical properties of metals, e.g., crystalline structure, porosity, homogeneity, and other characteristics. Instruction includes examining metals with x-ray, gamma ray, and magnetic-flux equipment for detecting defects, and the use of pressure devices, hot acid baths, and other apparatus to test hardness, toughness, and other properties of metals. (See, also, 0114 Metallurgical Technology under TECHNICAL EDUCATION)

26 00 Personal Services -- Planned learning experiences concerned with rendering a variety of personal services related to the physical appearance of individuals. These experiences include giving various kinds of beauty treatment, applying makeup to faces of studio and stage performers, attending clients taking baths, administering elementary massage and fitting wigs.

26 01 Barbering -- Classroom and practical learning experiences which are concerned with haircutting and styling, shaving, shampooing, and massaging. Emphases are placed on hygiene, skin and scalp diseases, and sterilization of instruments and utensils. Instruction is designed to qualify pupils for licensing examinations.

26 02 Cosmetology--Classroom and practical learning experiences which are concerned with a variety of beauty treatments, including the care and beautification of the hair, complexion, and hands. Instruction includes training in giving shampoos, rinses, and scalp treatments; hair styling, setting, cutting, dyeing, tinting, and bleaching; permanent waving; facials; and manicuring, and hand and arm massaging. Bacteriology, anatomy, hygiene, sanitation, and salon management (including keeping records), and customer relations are also emphasized. Instruction is designed to qualify pupils for licensing examination.

26 03 Fashion Model

26 04 Hotel Management

26 99 Other Personal Services -- Include here other organized subject matter content and learning experiences emphasized in personal services which are not listed or classifiable above. (Specify)

27 00 Plastics Occupations -- Classroom and shop learning experiences dealing with plastics and their characteristics, and with bench molding, fitting, internal carving, and finishing plastic and fiber glass materials into products. Instruction includes using hand and power tools.

27 01 Aircraft Plastics

27 02 Plastics -- Fabricating

28 00 Public Service -- Planned learning experiences concerned with training for the performance of occupations in local state and federal government agencies. These occupations usually are concerned with specialized activities limited to local, county, and state governments, and do not occur elsewhere in the economy. Typical activities include police and fire protection, emergency and rescue squad work, safety, sanitation, transportation, and school bus driving.

28 01 Fire Science -- Specialized class and practical learning experiences which are concerned with the practices and techniques of firefighting. Instruction treats the organization of a community fire department; the chemistry of fire; the use of water and other materials in fighting fires; the various kinds of firefighting equipment and aids and their uses, such as extinguishers, pumps, hose, rope, ladders, gas masks, hydrants, and standpipe and sprinkler systems; methods of entry; rescue principles, practices, and equipment; salvage equipment and work; fire and arson investigation; inspection techniques; and radiation hazards.

28 02 A Law Enforcement --

28 02 B Police Science -- Specialized class and practical learning experiences that are designed to supplement the training provided by officially designated law enforcement agencies. Instruction includes acquiring and maintaining the uniform; patrolling on foot or in an automobile during the day or night; dealing with misdemeanors, felonies, traffic violations and accidents; making arrests; and testifying in court.

28 03 Nursery School Assistant

28 99 Other Public Services -- Include here other organized subject matter content and learning experiences emphasized in public service occupations which are not listed or classifiable above. (Specify)

29 00 Quantity Food Occupations -- Organized specialized learning experiences which include theory and laboratory and shop work as they relate to planning, selecting, purchasing, preserving, preparing, and serving food and food products. Included is the study of a variety of foods and their nutritional values, food processing, quantity cooking, storing equipment, and sanitation in food handling and management.

Instruction emphasizes quantity food service occupations in commercial food service establishments such as restaurants, cafeterias, drive-ins, tea rooms, bakeries, and meat, fish, and poultry markets; in other retail food shops which are operated independently or are located in enterprises such as hotels, travel terminals, industrial plants, hospitals, or club houses; and in special food services such as those associated with airline catering or with take-out food establishments. Instruction is designed to prepare pupils for occupations such as baker, cook, chef, and meat cutter, or in planning, purchasing, preparing, storing, and preserving foods, or in services such as bus boy, waiter, or waitress.

29 01 Baker -- Specialized classroom and practical work experiences associated with the preparation of bread, crackers, cakes, pies,

pastries and other bakery products for retail distribution or for consumption in a commercial food service establishment. Training includes making, freezing, and handling of bake products; decorating; counter display; and packaging of merchandise. Training prepares the pupil as an all-around baker, although he may be employed in the production of any one type of goods such as pastries.

29 02 Cook -- Specialized classroom and practical work experiences concerned with the preparation and cooking of a variety of foods. Included is study of the use and care of equipment, food standards such as the selection and preparation of food and the determination of size of servings; sanitation procedures, including food handling; cooking methods such as broiling and steaming; and the preparation of special dishes such as soups, salads, garnishes, souffles and meringues. Although the pupil qualifies as an all-around worker, he may, depending on the size of the establishment, specialize in the preparation of specific types of foods, e.g., meats, vegetables or sauces.

29 03 Meat Cutter -- Specialized classroom and practical work experiences concerned with the cutting, trimming, and preparation of carcasses and consumer-size portions for sale by wholesale or retail establishments, or for cooking in a food service establishment. Instruction is provided in the use of certain meat-cutting tools, identification of and techniques used in cutting different cuts of meats, dressing poultry, processing fish, counter display, and refrigeration of meats, poultry, and fish.

29 04 Waiter/Waitress -- Specialized classroom and practical work experiences in table preparation, food handling, and serving. Instruction is provided in personal cleanliness and appearance, sanitary handling of food and equipment, setting a table, receiving and seating guests, taking orders and interpreting the menus, carrying the tray and dishes, placing orders in the kitchen, serving procedures, making out checks, accepting money and making change for checks, and proper relations with fellow employees and customers.

29 05 Restaurant Management

29 99 Other Quantity Food Occupations -- Include here other organized subject matter content and learning experiences emphasized in quantity food occupations which are not listed or classifiable above. (Specify)

30 00 Refrigeration -- Classroom and shop learning experiences concerned with commercial chilling and freezing systems, including theory, application, and operation of compressors, expansion and float valves, thermostats, and pressure controls; diagnosing overhauling, and testing methods and procedures; charging and discharging systems with refrigerants; and testing hermetic units, relays and overload devices.

31 00 Small Engine Repair (Internal Combustion) -- Classroom and shop learning experiences which are concerned with maintaining and repairing a variety of small engines used on portable power equipment, e.g., lawnmowers, outboard motorboats, chain saws, and roto-tillers. Instruction includes principles of internal combustion engine operation, reading technical manuals, and customer relations.

33 00 Textile Production and Fabrication -- Classroom and shop learning experiences which are concerned with all aspects of the fabrication of textiles and kindred materials. Instruction emphasizes the fabrication and repair of garments constructed of cotton, wool, synthetic fibers, or fur; apparel accessories, e.g., handbags, belts, shoes, and gloves; white goods such as sheets and pillow cases; and furnishings, such as slip covers, drapes, and curtains.

33 01 A Dressmaking and Design --

33 01 B Millinery -- Specialized classroom and laboratory learning experiences which are concerned with the construction, alteration, and fitting of women's apparel such as dresses, coats, and suits. Instruction includes sketching; style, line, and color in fashion design; patternmaking, cutting fabric to patterns; draping; machine and hand stitching; altering finished garments, including cleaning and pressing; classification, identification, and selection of fabrics.

33 02 Tailoring -- Specialized learning experiences which are concerned with the favrication and alteration, by hand and machine, of all types of men's, women's, and children's outer garments. Instruction includes taking measurements, preparing patterns, cutting, sewing, and fitting; hand and powered machine sewing; hand and machine pressing; and making repairs and alterations, from start to finish, according to patterns and designer's specifications.

33 03 Garment Cutting

33 04 Power Sewing

33 99 Other Textile Production and Fabrication -- Include here other organized subject matter content and learning experiences emphasized in textile production and fabrication which are not listed or classifiable above. (Specify)

34 00 Shoe Manufacturing/Repair -- Classroom and shop learning experiences which are concerned with the fabrication and repair of all types of footwear, e.g., shoes, boots, moccasins, sandals, slippers. Instruction emphasizes types and care of shoes; kinds and uses of tools and machines; shoe construction; shoe repairing, including replacement of worn parts such as heels and soles, and sewing parts that need mending; orthopedic shoe making and repair; leather refinishing and dyeing; salesmanship; and simple bookkeeping. Repairing of other leather articles such as handbags, luggage, and belts may be included in instruction.

35 00 Upholstering -- Classroom and shop learning experiences which are concerned with all aspects of upholstering, including furniture, automobile seats, caskets, and mattresses and bedsprings. Instruction includes history and styles of furniture; installing, repairing, arranging, and securing springs, filler, padding, and covering material; patternmaking; cutting, sewing, and trimming outside coverings; cushion filling; styling and designing; tufting and buttoning; and wood refinishing.

36 00 Woodworking Occupations -- Classroom and shop learning experiences which are concerned with woodworking occupations other than construction carpentry. Instruction emphasizes laying out and shaping stock; assembling complete wooden articles or subassemblies; marking, binding, sawing, carving, and sanding wood products; and repairing wooden articles. Also emphasized are various hand and power tools and their uses.

36 01 Mill Cabinetmaking -- Specialized class and practical work learning experiences which are concerned with mass producing products such as window frames, moldings, trim, and panels; and with making such products as furniture, store fixtures, kitchen cabinets, and office equipment. Instruction includes training in cutting, shaping, and assembling parts by means of hand tools and woodworking machines; refinishing furniture; installation of hardware, e.g., hinges, catches, drawer pulls; planning layouts; blueprint reading; drafting; and kinds of woods.

36 02 Furniture Making and Refinishing

36 99 Other Millwork and Cabinet Making -- Include here other organized subject matter content and learning experiences emphasized in millwork and cabinet making which are not listed or classifiable above. (Specify)

37 00 Other Trades and Industry Occupations -- Include here other organized subject matter content and learning experiences emphasized in trades and industrial occupations which are not listed or classifiable in one of the above major categories. (Specify)

37 01 Auto Painting

# WORK EXPERIENCE EDUCATION

19.00 00

01 00 Exploratory Work Experience Education -- Exploratory work experience is a guidance program which affords students an opportunity to observe and sample a variety of jobs in order to ascertain the student's suitability for an occupation. Students receive school credit but no pay and are not expected to perform productive work.

02 00 General Work Experience Education -- General work experience education is a school coordinated part-time employment program for the purpose of assisting students to acquire proper attitudes and good work habits. The part-time employment need not be related to the occupational goal of the student. Both pay and school credit are received by the student.

03 00 Vocational Work Experience Edudation -- This program extends vocational learning opportunities to students currently enrolled in vocational classes by providing part-time employment in the occupation for which the student is preparing. The part-time employment is coordinated by the school, and the student receives both pay and credit.

04 00 Vocational Work Experience Education (not currently enrolled in a related vocational class) -- This program offers vocational learning experiences to students in occupations for which the school offers no related vocational class. In this program the students realistic occupational objective becomes a matter of record and through school coordination the part-time employment provides preparation for full-time employment in that occupation. The student receives both pay and school credit in this program.

## FOREWORD

In recent years, supervision of the various subject matter fields in the secondary schools has emerged as a major professional function. This stems from an increasing awareness on the part of secondary school administrators of the value of carefully planned staff supervision and leadership.

In most schools, the position of department chairman has been created as a means of implementing this concept. Upon the shoulders of these chairmen falls a many-faceted assignment involving a multitude of responsibilities. In an attempt to assist the department chairman to delineate his responsibilities, this publication has been devised as a manual of procedures and suggestions for business education department chairmen in secondary schools. The list is not meant to be exhaustive but to suggest what may be some of the principal aspects of a chairman's work.

Credit for bringing together the content of this handbook should be accorded Dr. Roswell E. Fairbank, State University of New York at Albany, the coordinator of the project and the designer of the final form of the publication; Mr. Jack Grossman, Grace H. Dodge Vocational High School; Mrs. Hannah Joseph, Syracuse City Schools; and Mr. Bernard A. Shilt, Buffalo City Schools, who also reviewed manuscripts; Mr. Louis R. Rosettie, Division of Occupational Education Supervision, New York State Education Department; and Mrs. Jeanette Schur, Syosset High School. The materials were edited by Mr. John J. Brophy and Mr. Elton T. Murphy, Bureau of Business and Distributive Education, New York State Education Department; and Miss Leda E. Simone, graduate student at State University of New York at Albany. Final copy was prepared for publication by Alvin E. Rubin, Associate in Vocational Curriculum.

William E. Young
*Director, Curriculum Development Center*

# INTRODUCTION

The person designated as chairman of any school department is confronted with a broad range of leadership responsibilities. Such an individual is a key person in helping his staff to grow and become increasingly effective in their teaching activities. The chairman for business and distributive education is no exception; he must be a leader.

The effective chairman must have deep educational, psychologic, and economic insight. His responsibilities may range from curriculum development and staff supervision on the one hand to matters of equipment selection and budgeting on the other. He must be as effective in dealing with the members of his staff as he is in interpreting the business and distributive education program to the local community. He must have a command of subject matter as well as of techniques for inspiring experimentation and innovation. He must be respected for his judgment and, when necessary, have the courage to say "no."

Increasingly numerous and urgent requests for guidelines have prompted the Bureau to prepare this publication listing the principal responsibilities of the chairman of a high school department of business and distributive education. An attempt was made to recommend criteria for small as well as large schools with realization that the scope of the activities will necessarily vary from school to school.

In order to facilitate a chairman's self-evaluation, the various facets of his work have been prepared as a checklist. The chairman may find it helpful to check those items that he already performs in the course of his duties and to let the unchecked items serve as indices of new opportunities for service.

The Bureau of Business and Distributive Education is anxious to receive from chairmen in the field their evaluation of this publication. Suggestions regarding responsibilities presented or that should be included in future revisions will be most welcome.

PART I

## Preparing for the Opening of School

The department chairman should utilize some of the summer recess in preparation for the opening of school.

### Check List of Clerical Routines

Textbooks

_____ Inventorying

_____ Numbering

_____ Ordering

_____ Collecting books not handed in at the end of the June and August sessions

_____ Making textbook price list

_____ Distributing textbooks

_____ Distributing teacher texts and manuals

Supplies

_____ Distributing roll books and plan books

_____ Distributing attendance registers

_____ Distributing duplicating materials

_____ Distributing paper

_____ Distributing standard supplies

_____ Duplicating necessary forms

_____ Pruning files

_____ Distributing keys

_____ Assigning teachers to specific non-teaching duties

_____ Preparing publicity program

Preparing conference schedules

_____ Individual

_____ Department

_____ Committee

_____ Planning assembly programs

Assignment of Teachers

_____ Considers class size, subject difficulties and possible discipline problems when assigning classes to first-year teachers.

_____ Endeavors to place teachers in subject matter field for which they are best prepared, honoring, where possible, the teachers' preferences.

_____ Assigns teachers a minimum number of daily preparations.

_____ In assigning classes, avoids preferential treatment of tenured personnel to the detriment of new teachers.

_____ Where possible, assigns first-year skill subjects to proven teachers.

_____ Endeavors to equalize work load of all teaching personnel.

_____ Where possible, alternate assignment of at least one class per teacher each year.

_____ Makes room assignments after considering the instructional advantages of each facility.

Orientation of Teachers

Formulates an orientation program for the Business and Distributive Education Department which will:

_____ be sufficiently flexible to meet the varying needs of the beginning teacher as well as the experienced teacher

_____ provide an opportunity for a free exchange of ideas

_____ utilize procedures designed to engender a satisfactory adjustment of the new teacher to the teaching environment

_____ provide for a "buddy" teacher for each new teacher to assist him with department procedures in relation to the total school program

_____ provide for a review of district and school handbooks with new teachers

_____ arrange for special department meetings for the orientation of new teachers in conjunction with overall pre-school orientation

utilize part of regularly scheduled department meetings to discuss school routines, including:

_____ awards program

_____ bulletin boards

_____ classroom lighting and ventilation

_____ discipline

_____ extra-curricular and co-curricular activities

_____ field trips

_____ grading policies and reports to parents

_____ lesson plans

_____ machine maintenance and repair policies

_____ nature of student body

_____ passes

_____ requisitioning procedures

_____ room security and housekeeping

_____ teacher observation and follow-up

_____ teacher absences

_____ testing and grading systems

_____ textbooks and supplies

_____ use of audio-visual equipment

_____ visits to other schools

## PART II

### Developing the Curriculum

The department chairman in working with his staff to plan instruction:

_____ discusses the school's philosophy of education

_____ develops a written philosophy of business education

_____ formulates long-term objectives

_____ surveys the total school curriculum to determine the needs for business and distributive education

substantiates the need for curriculum changes by:

_____ presenting data from professional literature

_____ making use of lay and professional consultants

_____ using survey data

_____ employs democratic procedures in determining course content

_____ explores possible innovations considering philosophy, goals, and methods

_____ establishes time schedules for curriculum projects

_____ pools currriculum ideas and materials

_____ plans pilot programs

_____ obtains the latest syllabuses, guides, and manuals prepared by the Bureau of Secondary Curriculum Development and distributed by the Publications Unit of the New York State Department of Education

_____ makes arrangements for duplication and distribution of pertinent publications and reports

_____ interprets the program to the school, staff, and public

_____ plans the program for continuous evaluation and revision

_____ assists in the development of local policy regarding which students will be enrolled in courses, their ages, ability levels, course prerequisites, and anticipated outcomes

develops written curriculum guides which include:

_____ subject matter content by topics or units

_____ approximate time allocation for each unit

_____ teaching techniques used to present each topic

_____ teaching aids

_____ performance standards expected from the students

evaluates textbooks and supplementary materials after the course of study has been determined. Answers are sought to the following questions:

_____ Which textbook and/or supplementary text material will best assist teacher and students in attaining course objectives?

_____ Are the topics presented accurately, completely, and in logical sequence?

_____ Is the content current?

_____ Is the reading level appropriate?

_____ Are suggested learning activities appropriate?

_____ Are helpful teaching materials provided by the publisher?

_____ Is the format, print, and overall makeup satisfactory?

## PART III

### Improving and Evaluating Instruction

Classroom visitations are of vital importance in improving instruction. Following is a list of evaluative criteria which might be considered:

General

_____ Discipline and general classroom learning atmosphere

_____ Student participation

_____ Student-teacher rapport

_____ Motivational techniques

_____ Voice, physical appearance, and mannerisms of teacher

_____ Teacher's command of subject matter

Physical Condition of the Room

_____ Ventilation and lighting

_____ Cleanliness and orderliness

_____ Condition of student and teacher desks

_____ General housekeeping details

Seating of Students

_____ Seating charts

_____ Provision for students with physical defects

Chalkboard Routines

_____ Boards cleaned at the beginning of the period

_____ Lesson references are on the board at the beginning of the period

_____ Material distributed on a number of index cards so that it can be divided among several students for placement on the boards

_____ Unfinished business of the previous class is disposed of while the boards are being prepared

_____ Important announcements are read and also written on the board

_____ Solutions at the board are identified by student name

_____ Boards are cleaned by a student assistant

Starting the Period

_____ Teacher is in the room at the beginning of the period

_____ Punctual attendance is enforced

_____ Class begins promptly with the ringing of the bell

_____ Student writes the homework assignment on the board for the remainder of the class to copy

_____ Students record the assignment as soon as they enter the classroom

_____ Student writes the "warm-up" exercise on the board, with the class solving the problems indicated

_____ Teacher observes student work and guides individual students

Handling Assignments

_____ Each assignment is numbered for convenience in checking and crediting

_____ Assignment for the next day is always written on the same board

_____ Work and materials are distributed and collected quickly

Attention to Written Work

_____ All written work bears the regular school heading

_____ Sorting, recording, and filing of the students' work is facilitated by an identification number for each student, a number that appears on all work submitted

_____ Written work is collected systematically by rows upon signal and collated in a predetermined sequence

The Lesson Proper

_____ The teacher is assisted in classroom routines by students

_____ Maximum use is made of the chalkboard

_____ Transition from one phase of the lesson to another is effected smoothly

End-of-Lesson Routines

_____ Lesson summary is made

_____ Work is continued until the bell rings, but not after the bell

Undesirable Teaching Practices

_____ Minimal opportunity for pupil participation

_____ Exercises assigned as "busy work"

_____ Excessive class time devoted to grading papers

_____ Overdependence on textbooks

_____ Insufficient use of teaching aids

_____ Misuse or lack of use of audio-visual aids

_____ Improper utilization of the chalkboard

_____ Insufficient planning

_____ Inadequate concern for individual differences of students

_____ Poor questioning technique

_____ Overuse of teacher's personal experiences

Evaluative Routines

_____ Tests are proofread in advance

_____ Instructions for tests are clear and definite

_____ Work stops on signal and papers are collected systematically

_____ Facility of marking is attained through objective scoring techniques

_____ Graded papers are arranged for expeditious return to the class

_____ Remedial work is expedited through diagnostic testing

The Follow-up Conference

_____ Is scheduled as soon as possible after the observation

_____ Provides an opportunity for sharing information, pointing out strengths and weaknesses, planning for improvement and becoming better acquainted

_____ Gives the teacher an opportunity to explain his methods or procedures

_____ Creates a climate for teachers to question, to improve, and to innovate teaching methods and special projects

## PART IV

### Promoting Professional Development

The department chairman strives to help his staff develop professionally by:

_____ recommending promotion of teachers on merit basis

_____ offering sympathetic counsel and assistance to teachers with personal problems

_____ striving to create good working conditions

_____ explaining grievance procedures

encouraging the use of the department's professional library:

_____ college textbooks

_____ high school textbooks

_____ professional reference books

_____ business and distributive education periodicals

_____ education department publications

_____ encouraging the reading of other professional publications

_____ circulating articles of current interest

_____ promoting membership in professional organizations

_____ providing opportunities in departmental meetings for reporting on topics discussed at professional meetings

_____ encouraging teacher participation in faculty committee work

_____ encouraging teachers to contribute articles to professional journals

_____ encouraging attendance at in-service courses

encouraging participation in:

_____ extension courses

_____ correspondence courses

_____ summer school courses

_____ informal study groups

_____ institutes and lectures held by individual schools and faculties

providing for demonstration teaching

_____ arranges to have superior teachers give demonstration lessons

_____ follows up the demonstration with a conference for evaluative purposes

maintaining a bulletin board for departmental use

_____ separates administrative and supervisory announcements

_____ keeps bulletin board current

_____ posts only brief notices or clippings

_____ uses concrete illustrations

_____ publicizes the names of teachers using specific devices

## PART V

### Establishing and Maintaining Good Public Relations

The department chairman utilizes every available avenue for establishing and maintaining good public relations. Following are some suggestions for accomplishing this:

Contacts With Businessmen

_____ Institutes a "Business-Industry-Education Day"

_____ Maintains informal contacts with business

_____ Holds a summer position in business

_____ Conducts a cooperative work-experience program

_____ Uses business-sponsored instructional aids

_____ Attends business-sponsored workshops and conferences for teachers

_____ Encourages the development of an adult business education program

_____ Attends and participates in Administrative Management Society Meetings

_____ Encourages participation on advisory committees

_____ Joins business and service organizations

Contacts With Parents

_____ Reports on students' work

_____ Holds a department open house

_____ Publicizes the business education program

_____ Encourages parental visitations

_____ Participates in parent-teacher association activities

Participation in Professional Groups

_____ National, state, and local business and general education association activities

_____ Business education cadet teaching programs

_____ Research studies

_____ Conferences and workshops

Public Relations Through School-Sponsored Activities

_____ FBLA, FSA, DECA, and other youth organizations

_____ Honorary, service, and special-interest clubs in which business students participate

_____ Business and distributive education classroom bulletin boards

_____ Assembly demonstrations by expert typists, machine operators, etc.

_____ Field trips to offices, stores, and plants in the community

_____ Parent-Visitation Day (or Night)

_____ Education-Industry-Business Day

_____ Career Day (or Week)

_____ Observance of American Education Week

Contacts With Students

_____ Maintains an effective instructional program

_____ Provides guidance in planning programs and choosing careers

_____ Establishes a program for recognition of outstanding student achievement

Contacts With Board of Education

_____ Represents the department at board meetings at the request of the chief school administrator

_____ Provides progress reports of the department

Contacts With the School Office, Maintenance, and Service Staffs

_____ Uses selected school offices as learning stations for business education students

_____ Provides information about business and distributive education courses, curricula, and students to the office staff

_____ Issues invitations to visit the business education department during special events

Inter-departmental Relations

_____ Serves on inter-departmental committees

_____ Exchanges professional literature

_____ Exchanges instructional materials and ideas

_____ Arranges for senior business students to act as secretaries for department chairmen

_____ Assists in planning assembly programs

_____ Encourages team teaching

_____ Encourages inter-departmental workshops

_____ Promotes new programs

## PART VI

## Reporting

The department chairman prepares regular reports for the board of education, advisory committees, guidance counselors, and others.

### Board of Education

Prepares progress reports of

_____ teachers

_____ pupils

_____ graduates

Prepares evaluative reports pertaining to

_____ subject matter

_____ teachers

_____ facilities

_____ programs

Prepares follow-up studies of

_____ graduates in office occupations

_____ graduates in distribution

### Principal

Prepares reports summarizing department activities

_____ conferences

_____ department meetings

_____ classroom observations

Prepares annual reports on the accomplishments and professional activities of the members of the business education staff

Prepares annual departmental reports pertaining to

_____ textbooks

_____ teachers' schedules

_____ class load

_____ training

_____ experience

_____ size of room

_____ equipment

_____ Regents results

Guidance Counselors

Prepares reports on

_____ students' capabilities in certain areas

_____ student progress

_____ new curriculum developments

_____ policy of the department

_____ follow-up studies of business graduates

Advisory Committee of Teachers

Prepares reports on

_____ salary schedules

_____ sick leave

_____ qualifications and selection of teachers

_____ in-service education

_____ teaching schedules

_____ required courses

_____ refresher courses

_____ enrichment

_____ acceleration

_____ visual materials

_____ promotion policies

_____ public relations

## PART VII

### Department Meetings

The department chairman takes definite steps to insure the effectiveness of staff meetings. The meetings:

_____ are regularly scheduled with written advance notice

_____ adhere to prescribed time schedule

_____ are conducted in a predetermined location

_____ follow written agenda

_____ include materials which have been prepared in advance

include discussion topics, such as:

_____ correlation of subject matter

_____ building plans

_____ bulletin boards and other audio-visual aids

_____ clubs and awards program

_____ consideration of teacher recommendations and suggestions

_____ course changes

_____ current literature

_____ discipline

_____ field trips

_____ grading and tests

_____ grouping

_____ in-service training

_____ interdepartmental and public relations projects

_____ lesson plans

_____ maintenance of machines and housekeeping

_____ membership in professional organizations

_____ reports

_____ requisitions and budget

_____ teacher observations and complaints

_____ teacher recruitment and substitutes

_____ team teaching and other methods of instruction

_____ textbooks and other instructional materials

## PART VIII

### Recruitment of Teachers

The department chairman assists the school administrators in the recruitment of teachers by:

_____ urging teachers to stimulate student interest in teaching as a career

_____ encouraging teachers to work toward proper certification

_____ informing members of parent-teacher associations of career opportunities in teaching

_____ suggesting the employment of retired teachers as substitute teachers

_____ notifying college placement bureaus of vacancies

_____ acquainting teacher-preparatory institutions with certification requirements

_____ maintaining a file of prospective teachers

_____ contributing to the school's teacher recruitment brochure

_____ interviewing applicants for teaching positions, when requested

## PART IX

### Budget Development

The department chairman works with his teachers in planning budgetary requests by:

_____ determining cost of supplies and equipment needed to accomplish the objectives of the business and distributive education program

_____ substantiating needs with supporting data in budget requests

_____ evaluating individual teacher requests in light of total program

considering program expansion or new facilities:

_____ enlisting the cooperation of his teachers

_____ consulting available literature on facilities planning

_____ visiting other schools

_____ consulting with appropriate bureau of State Education Department

_____ confering with architects when requested

_____ establishing a policy of repair and placement of equipment

_____ reviewing final budget with his staff and explaining reasons for changes from original requests

## Reference Materials

The department chairman maintains a file of special manuals and handbooks prepared by the Bureau of Business and Distributive Education, New York State Education Department, which may be of value to him when working with local school administrators on curricular and supervisory matters.

_____ An Administrative Handbook for Business and Distributive Education

_____ A Pictorial Guide to Aid in Planning Business and Distributive Education Classrooms and Facilities

_____ Cooperative Work-Experience Programs in Offices, Stores and other Distributive Outlets

_____ Cooperative Work-Experience Manual for Business and Distributive Education

_____ Distributive Education Laboratory Manual

_____ The School Administrator Looks at..... Cooperative Business and Distributive Education Work-Experience Programs

_____ The School Administrator Looks at..... Nonvocational, General and Personal-Use Values of Business Education

_____ The School Administrator Looks at..... Vocational Business Education

KANSAS

Questionnaires mailed to area school directors and school records in the office of the State Board of Vocational Education provided the Board with information about the State's 14 area vocational-technical schools. Findings included: (1) The average personnel per school was 1.98 administrators, 18.57 full-time instructors, 3.4 clerical, and 2.25 staff members, (2) The 1968 budgets for all schools totaled $7,784,430.00, (3) The investment ratio between equipment and building inventory was 1 to 1.02, (4) Individual programs varied in length from 180 hours to 2,160 hours, (5) Most programs had no entrance requirements except age, (6) Of the 8,867 students enrolled in vocational programs in 10 schools, 30.66 percent completed their training and, of these, 62.45 percent were placed on jobs related to their training, (7) The average starting annual salary of the 1967 graduates was $3,544.08, (8) The average placement of graduates in Kansas for 1965-67 was 53.69 percent. Recommendations concerned: (1) implementing a new participating district system, (2) standardizing time for completion of programs and titles of courses, (3) developing experimentation, demonstration programs, and cooperative and team teaching, and (4) conducting studies about program completion, placement, relationship of programs to need and cost benefit analyses. Many of the specific data are reported in tabular form. Vocational school organization is also summarized for 32 states. (EM)

## FOREWORD

The importance of vocational-technical education has been highlighted by statistics showing that approximately 16 per cent of the students in the United States who enter kindergarten will eventually complete a four-year college education. The challenge that must be met is to offer the 84 per cent who do not graduate from a four-year college an equal opportunity to leave school, whatever the age, with a salable skill that is in demand in our ever-changing technological society. The state of Kansas has 14 area vocational-technical schools, which have been approved by the State Board for Vocational Education via authority of Senate Bill No. 438 in 1963. The first AVTS programs were made available during the 1964-65 school year (fiscal year 1965). This is one way that Kansas is attempting to meet the needs of all its citizens.

The State Board for Vocational-Technical Education requested the services of the Research Coordinating Unit in making a preliminary study of the area vocational-technical schools. This study was conducted in an effort to determine the progress made, types of students served, programs offered, and to develop recommendations for a more adequate record and information system to be used by the AVTS and the State Office of Vocational and Technical Education.

Study personnel were handicapped by limited time and lack of uniform information.

December, 1967

John E. Snyder
Director and Executive Officer
State Board for Vocational Education
Topeka, Kansas

ACKNOWLEDGMENTS

This preliminary study of area vocational-technical schools of Kansas could never have been accomplished without the cooperation of area school officials.

Special appreciation must be extended to John E. Snyder, Director and Executive Officer, Kansas State Board for Vocational Education, Kenneth M. Hay, State Supervisor, Area Vocational-Technical Schools, and other administrative and supervisory staff members of the State Board for Vocational Education for their valuable suggestions and recommendations during the planning, development, and completion of this study.

A very special thanks goes to George A. Robinson, Director, Kansas Vocational Education Research Coordinating Unit, who provided services on the general design of the study, assisted in the development of the survey instruments, and contributed editorial services during the preparation of this report.

Finally, sincere appreciation is extended to Mrs. Phyllis Varner and Mrs. Lynn Volkert for their perseverance in typing the final copy of this study.

# CHAPTER

# I

# INTRODUCTION

With the passage of various vocational education acts, especially the Vocational Education Act of 1963 (P. L. 88-210), significant improvements in vocational education have evolved throughout the country. Kansas started area vocational-technical schools just four years ago. Within this short period of time, the area schools have become more familiar to the general public because of the kinds of services directly related to the preparatory, upgrading, and retraining functions of vocational-technical education.

This study was performed to secure information concerning certain aspects of the area vocational-technical schools of Kansas.

The first chapter gives the purpose, objectives, limitations, procedure, and definition of terms used in the study. Chapter II is a review of pertinent Federal and State legislation. The third chapter presents the findings of the study, while the fourth, fifth, and sixth chapters deal respectively with the summary, conclusions, and recommendations. The bibliography lists material, which was reviewed prior to the study or was used in preparing the appended summary of area vocational school programs in other states.

## Purpose

The basic purpose of the study was to assist the State Board for Vocational Education to gain a better idea of the functioning of area vocational-technical schools in Kansas.

## Objectives

The specific objectives of the study were:

1. To identify strengths and weaknesses of the existing area schools

2. To provide important information that would be helpful in planning, developing, and evaluating vocational-technical education in the area vocational-technical schools of Kansas

3. To provide a basis for further study of area vocational-technical schools.

## Limitations

The major limitations in this study were:

1. The fourteen existing area vocational-technical schools of Kansas

2. The short period of time

## Procedure

The following procedures were used to secure information:

1. Review of related literature and vocational education legislation - Federal and State

2. Write State Directors for Vocational Education for information concerning their area schools

3. Review AVTS reports in the office of the AVTS Supervisor

4. Structure instruments to be used in study

5. Mail survey instruments

6. Mail follow-up letters

7. Tabulate and compile information

8. Analyze information

9. Summarize information

10. Make recommendations

## Definition of Terms

### Vocational Education

Includes instruction offered in all-day or evening classes in high schools, in post high schools, or to persons over fourteen years of age who are engaged in or are preparing to enter the labor market. The purpose of vocational education is to instruct, train, or retrain individuals in occupational skills supplemented by the knowledge necessary to meet demands of specific jobs. The objectives involve the development of skills, abilities, attitudes, understandings, working habits, and proper appreciations that result in a satisfying useful life of work and good citizenship.

Technical Education

Technical education is defined as an "education to earn a living in an occupation in which success is dependent largely upon technical information and understanding of the laws of science and principles of technology as applied to modern design, production, distribution, and service."[1]

Area Vocational Technical School

"AVTS" has been defined as a school covering a large geographical territory, usually including more than one local basic administrative unit. It offers specialized training to all areas of the State, in occupations of less than professional level, to people who are preparing to enter specific jobs. It also provides vocational or technical education to persons who have completed or left high school and are available for full-time study.

According to the U. S. Selective Education Acts of 1963, the term "area vocational education school" means:

> (A.) a specialized high school used exclusively or principally for the provision of vocational education to persons who are available for full-time study in preparation for entering the labor market, or
>
> (B.) the department of a high school exclusively or principally used for providing vocational education in no less than five different occupational fields to persons who are available for full-time study in preparation for entering the labor market, or

---

1. Definitions of Terms in Vocational-Technical and Practical Arts Education, Washington, D. C. American Vocational Association, pp 20.

(C.) a technical or vocational school used exclusively or principally for the provision of vocational education to persons who have completed or left high school and who are available for full-time study in preparation for entering the labor market, or

(D.) the department or division of a junior college or community college or university which provides vocational education in no less than five different occupational fields, under the supervision of the State Board, leading to immediate employment but not leading to a baccalaureate degree.

...if it is available to all residents of the State, or an area of the State, designed and approved by the State Board, and if, in the case of a school, department, or division described in (C) or (D), it admits as regular students both persons who have completed high school and persons who have left high school.[2]

2. Committee on Labor and Public Welfare, United States Senate, Selected Education Acts of 1963, Washington: U. S. Government Printing Office, 1963, pp 73-74

CHAPTER

II

# REVIEW OF ACTS

## Vocational Education Acts

The Vocational Education Acts contain certain specific requirements for federally-aided programs. The standards that apply are:

(1) Education provided under these Acts shall be under public supervision and control.

(2) Such education shall be to fit people for gainful employment.

(3) Such education shall not lead to a baccalaureate degree.

Federal aid for the promotion of vocational education is based on two main ideas. The first provided for cooperation with the States in promoting vocational education in agriculture, home economics, trades and industries; the second, for cooperation with the States in the preparation of teachers of vocational subjects.

Four of the Acts which provide Federal funds are:

1. The Smith-Hughes Act: This 1917 Act made funds available to the various States for the promotion of vocational education in agriculture, home economics, trades and industries.

2. The George Dean Act: This Act became effective on July 1, 1937, and authorized monies in addition to the Smith-Hughes Act for the further

development of vocational education in agriculture, trades and industries, home economics, and distributive education. In 1946, the Act, as amended, became known as the George Barden Act.

3. The George Barden Act: To extend the use of federal funds for additional vocational activities in the several States and territories, this legislation was enacted in 1946. When this legislation was passed, the Smith-Hughes authorization became known as Title I, while Title II dealt with practical nursing. The National Defense Education Act (Title VIII), which provides an appropriation for the training of technicians, became Title III of this Act.

Use of federal funds for area vocational education programs is outlined under Title III, Sec. 304. While this section states that equipment and teaching aids purchased with funds appropriated under the Acts shall become the property of the State, it also provides for:

1. maintenance of adequate programs of administration, supervision, and teacher-training;
2. salaries and necessary travel expenses of State or local school personnel including teachers, coordinators, supervisors, vocational guidance counselors, teacher-trainers, directors, administrators, and others;
3. travel expenses of members of advisory committees or State boards;
4. purchase, rental, or other acquisition, and maintenance and repair of instructional equipment;
5. purchase of instructional supplies and teaching aids;
6. necessary costs of transportation of students;
7. securing necessary educational information and data as a basis for the proper development of area vocational education programs and programs of vocational guidance;

8. training and work-experience training programs for out-of-school youths;

9. related instruction for apprentices; and

10. determining the need for, and planning and developing, area vocational education programs.[3]

The Vocational Education Act of 1963:

In the words of the Vocational Education Act of 1963, its purpose is "to authorize federal grants to states to assist them to maintain, extend, and improve existing programs of vocational education, to develop new programs of vocational education, and to provide part-time employment for youths who need the earnings from such employment to continue their vocational training on a full-time basis, so that persons of all ages in all communities of the states - those in high school, those who have completed or discontinued their formal education and are preparing to enter the labor market, those who have already entered the labor market but need to upgrade their skills or learn new ones, and those with special educational handicaps - will have ready access to vocational training or retraining which is of high quality, which is realistic in the light of actual or anticipated opportunities for gainful employment, and which is suited to their needs, interests, and ability to benefit from such training."[4]

State Legislation - Senate Bill No. 438

Declaration of Purpose - cooperation by the State of Kansas and local communities in:

1. providing facilities for training and preparation of students for productive employment as technician and skilled workers;

---

3. Ibid., pp 117-118.

4. Public Law 88-210, 88th Congress, approved December 18, 1963. Vocational Education Act of 1963, p 1.

2. more nearly equalizing educational opportunity.

Location and Establishment of Area Vocational-Technical Schools - plans for AVTS shall include information on:

1. population concentration;

2. total school enrollments for grades one through eight and for grades nine through twelve;

3. number of high school graduates within area to be served;

4. probability of sustained growth in school enrollments in the area;

5. identification of educational services needed in area;

6. local interests and attitudes;

7. ability of area to contribute to financial support of program;

8. overlap or program duplication in educational services.

Administrative Organization - The board of control is the governing body of the AVTS. The two types are:

1. the board of the school district (board of control) in which the AVTS is located (Type I) employs a director who has the responsibility for developing the area vocational-technical school;

2. a board composed of representatives from the cooperating school districts (Type II) employs an administrator to develop the AVTS and administer its program.

Financing - Provisions were made for:

1. use of federal money within the provisions of federal legislation;

2. establishment of tuition and fees -

   a. for part-time students;

   b. for students from non-participating districts;

3. use of State funds for vocational instruction expense;

4. legislative appropriations requested by state board to establish, conduct, maintain, and operate area vocational-technical schools;

5. participating and cooperating school districts to levy a tax not to exceed a two mill levy for sharing the costs of establishing, conducting, maintaining, and operating area vocational-technical schools;

6. AVTS governing bodies to receive and use donations, gifts, grants,or bequests.

<u>Governing bodies of any cooperating or participating school district shall have authority:</u>

1. to issue general obligation bonds of such school district;

2. to acquire lands by purchase or eminent domain;

3. to improve or construct buildings or other improvements;

4. to equip, furnish, repair, remodel, or make additions to any buildings used or to be used for AVTS;

5. to hold bond elections for issuance of bonds (outstanding bonds not to exceed $50,000 at any one time).

<u>Qualifications for Applicants: Rules and Regulations Governing</u> -

Eligibility will be determined by:

1. minimum age requirements provided by law for specific occupational training programs;

2. rules and regulations established by the board of control.

Sec. 72-4302 Amendment - administration of the act shall be by the state board for vocational education with the director and executive officer of the board designated to administer the act.

Effective Date - July 1, 1963.

# CHAPTER

# III

# FINDINGS

The various aspects of the study covered by the survey instruments included: personnel; participating school districts; sources of financing; an inventory of land, buildings and equipment; program offerings and instructors for fiscal year 1968; student enrollment, completion, and follow-up by programs.

Survey instruments were mailed to the directors of the 14 area vocational-technical schools. Rather limited information was received from two area schools, which were continuing in an administrative capacity during fiscal year 1968, and from two others that would be offering programs for the first time during this same period. Another school did not supply any information. Therefore, some of the quantitative data reported will not represent the complete activity of area vocational-technical schools.

## Types of Schools and Personnel

Table I - Types of Schools and Number of Personnel for Fiscal Year 1968 identifies the ten Type I schools and the four Type II schools. Also given is the number of personnel by categories for each of the schools. Included are totals and means.

TABLE I - TYPES OF SCHOOLS AND NUMBER OF PERSONNEL FOR FISCAL YEAR 1968

| Area Schools | Type I | Type II | Administrators | Instructors: Full-time | Instructors: Part-time | Cler. | Others | Total |
|---|---|---|---|---|---|---|---|---|
| 1. Arkansas City | x | | $1\frac{1}{4}$ | 10 | 2 | 2 | 1 | $16\frac{1}{4}$ |

| Mean | - | - | 1.98 | 18.57 | .36 | 3.4 | 2.25 | 26.6 |

*Four persons serve as administrator and instructor

**Part-time

The ten (71.42 per cent) Type I area schools are located in Arkansas City, Atchison, Dodge City, Emporia, Kansas City, Liberal, Manhattan, Salina, Topeka, and Wichita. The four (28.57 per cent) Type II area schools are Beloit, Central Kansas AVTS (Hutchinson, McPherson, Newton), Goodland, and Southeast Kansas AVTS (Coffeyville).

For fiscal year 1968, there was an average of 2.0 administrators, 18.75 full-time and 0.35 part-time instructors, 3.42 clerical, and 2.25 other staff members in the fourteen area vocational-technical schools.

Participating School Districts by Fiscal Years

| 9. Andale | | x | x | x |
| 10. Mulvane | | | | x |

An "X" type of checkmark in Tables II - XI indicates the participation of certain school districts in the AVTS by fiscal years.

Only 10 of 12 operating area schools (Arkansas City, Beloit, Central Kansas AVTS, Dodge City, Emporia, Goodland, Salina, Southeast Kansas AVTS, Topeka, and Wichita) responded to the item concerning participating school districts by fiscal years.

Of the responding schools 6 served 48 participating school districts averaging 8.00 per AVTS in FY 65. In FY 1966, 82 districts were reported as participating in 9 area vocational-technical schools, which gave an average of 9.11 districts per AVTS. The FY 67 participation was 71 districts in 9 AVTS with an average of 7.89 districts per school. During FY 1968, 80 districts were reported as participating in 10 schools, averaging 8.0 districts per AVTS.

The number of participating school districts in AVTS programs by fiscal years is shown in the following chart. One will note from the chart

| | 65 | 66 | 67 | 68 |
|---|---|---|---|---|
| Arkansas City | | | | 7* |
| Atchison | | | * | |
| Beloit | 8* | 9 | 4 | 4 |
| Dodge City | 2* | 3 | 3 | 3 |

that, although the total number of participating districts may be shown

as constant from one year to the next, Tables II - XI will show that some districts are irregular in their participation.

## Sources of Financing by Fiscal Years

Tables XII - XV are the sources of financing area vocational-technical school construction and operation for the fiscal years 1965 - 1968, inclusive. Sources include federal, state, and local monies besides that received from tuition and fees, gifts, services, etc., and bonds. Those amounts appearing between the federal and state columns were not separated with respect to source.

TABLE XII - SOURCES OF FINANCING FY1965

| Name of AVTS | Federal | State | Local | Tuition & Fees | Gifts Services Other | Bonds | Total |

Per cent Budget Increase or Decrease by Categories

Tables XVI - XVII - Per cent Budget Increase or Decrease by Categories covers the three fiscal years beginning with a comparison of the 1965 budget with the 1966 budget by categories for each area vocational-technical school. Categories compared include federal, state, local, tuition, and gift sources.

Percentage comparisons were made for only those schools which had at least two years of budget appropriations.

Percentage figures that appear between the federal and state columns are for monies that were not reported in separate amounts.

For the most part, a steady increase in total budget will be noted. Sharp declines among the categories in general followed a building program.

TABLE XVI - PER CENT BUDGET INCREASE OR DECREASE BY CATEGORIES FROM FY65 TO FY66

| Name of AVTS | Federal % | State % | Local % | Tuition % | Gifts % | Total % |
|---|---|---|---|---|---|---|

| Wichita | 71.99 | | 72.61 | | | 71.56 |

So that each fiscal year budget for the various area vocational-technical schools could be shown in relationship to its 1968 fiscal year budget, Table XIX was developed. No attempt was made in this or other tables to isolate that portion of the budget devoted to building programs. Sharp increases or decreases will denote, however, that building programs were underway or had been completed.

Figure I - Graphic Representation of Total AVTS Budgets for FY 65 to FY 68, Inclusive, has been included in this section to show the trend in cost of area school operation and to show relationship.

4. CKAVTS
5. SEKAVTS
6. Salina
7. Beloit
8. Goodland
9. Emporia
10. Manhatta
11. Dodge Ci

From Table XIX, budget totals will be noted for the seven schools (Beloit, CKAVTS, Dodge City, Emporia, Goodland, SEKAVTS, and Topeka) that were operational in FY 65. Fiscal year 1966 includes budgets of three additional schools (Manhattan, Salina, and Wichita) that offered their first programs.

In FY 67 the Kansas City, Arkansas City, and Liberal schools started to function administratively. Atchison was offering one program during that period. The 1968 fiscal period shows budget totals for 14 schools. Twelve were offering training programs, while two (Liberal and Kansas City) were continuing in an administrative capacity.

Each AVTS fiscal year budget has been compared on a quantitative and a percentage basis to its 1968 budget. For example, the $176,310 reported by Beloit for FY 65 was 44.37% of the $397,291 reported for 1968. Average percentages appearing with the column totals represent the relationship of each respective fiscal year grand total budget to the grand total budget for FY 68.

## An Inventory of Land, Buildings, and Equipment of Different Schools, June 30, 1967

The inventory for each area vocational-technical school has been reported in Table XX as the value of land, buildings, and equipment, followed by the total investment in those resources.

It will be noted that inventory data has been listed as a single line entry for each school except Central Kansas AVTS and Southeast Kansas AVTS. For those two schools the various components were reported separately.

TABLE XX - An Inventory of Land, Buildings, and Equipment as Reported by Area Vocational-Technical Schools, June 30, 1967

*Not participating now.

Area vocational-technical schools own a total of 216 acres valued at $713,905.00. It will be noted that land ownership ranges from zero acres to 50 acres. Simultaneously, schools having no land investment own no buildings. The 1,086,626 square feet of building space shown had a reported value of $4,584,715. Value of equipment was given as $3,532,352.69.

Total investment in land, buildings, and equipment was inventoried at $8,830,972.69.

## Program Offerings for FY 68 with Summary Information Concerning the Faculty, Their Education, and Experience

The major program offerings for fiscal year 1968 have been presented in Table XXI. Summarized with the program is information about the instructors, i.e., their education, teaching experience, and related work experience.

***One D. D. S. and another has D. A. Certificate.

From the summary of Table XXI one can determine that 48 major programs will be offered to students during fiscal year 1968 at eleven area vocational-technical schools. For these programs 244 instructors will be teaching high school and post-high school students.

Of the 244 instructors, 74 hold Bachelor's degrees and 67 Master's degrees. This leaves 103 non-degree teachers. Since persons with approved trade experience can be recommended for certification on an annual basis in a reimbursed program, all instructors are certified to teach both high school and post-high school students.

Teaching experience in education, other than AVTS, totaling three or more years, was reported in nine instances. They were: business education, commercial art, distributive education, electronics, food services, home economics, library, office education, and vocational agriculture. Instructors for four programs were listed as having had no teaching experience at any level.

Related work experience is considered important for instruction in many programs. For example, the average years related work experience for the two instructors in the building trades programs was given as 37.

Data Concerning Curriculum, Student Qualification & Enrollment, Program Completion, and Follow-up by Fiscal Years

Tables XXII, XXIII, and XXIV include fiscal years 1965, 1966, and 1967 respectively. Major and related vocational-technical training programs, time for completion, enrollment requirements, enrollment information, and some follow-up data have been included for each of the three fiscal years.

*Typing and bookkeeping and/or shorthand

Tables XXII, XXIII, and XXIV show that program offerings have increased during the three fiscal years 1965, 1966, and 1967. One will observe, however, that without reviewing program descriptions, it is rather difficult to distinguish between some of those named. The agricultural programs, for example, were reported under four different names. Completion time varied from 180 hours to 1080 hours. Enrollment varied from' strictly high school to both high school and post-high school. The same is true of other program offerings. Auto mechanics was reported as a nine-month program in one school, an 18-month in another, and a 27-month program in a third. Other observations will reveal that one program was called business education. Similar program titles were office education, office practice, and office machines in addition to office occupations pre-employment, and office occupations cooperative part-time.

Enrollment in the AVTS program increased from 1920 students in fiscal year 1965 to 3975 in fiscal year 1967 for ten of the eleven schools offering programs. The following tabulation gives the relationship of high school and post-high school enrollment for the three-year period.

| | H.S. | | P.H. | | Total |
|---|---|---|---|---|---|
| | No. | % | No. | % | |
| 65 | 1365 | 71.09 | 555 | 28.91 | 1920 |
| 66 | 2097 | 70.55 | 875 | 29.45 | 2972 |
| 67 | 2488 | 62.59 | 1487 | 37.41 | 3975 |
| Total | 5950 | 67.10 | 2917 | 32.90 | 88.67 |

The preceding chart indicates that for the three-year period high school students comprised 67.10% of the reported enrollment, while 32.90% was composed of post-high school students.

The next illustration gives the enrollment by sex. Males in the re-

| | Male | | Female | | Total |
|---|---|---|---|---|---|
| | No. | % | No. | % | |
| 65 | 1461 | 76.09 | 459 | 23.91 | 1920 |
| 66 | 2295 | 77.22 | 677 | 22.78 | 2972 |
| 67 | 2785 | 70.06 | 1190 | 29.94 | 3975 |
| Total | 6541 | 73.76 | 2326 | 26.24 | 8867 |

ported programs averaged nearly three for each female.

In most of the programs there was no qualification for enrollment. Some variations were: minimum age for specific occupations, prerequisite courses, and scores from required testing program.

Data about numbers of students completing training programs was incompletely reported. To illustrate, the diesel mechanics program at Salina is an 18-month (2160 hour) program which was offered for the first time during FY 66. There were 24 students in the first year of this program. None were shown as having completed the training, which could be expected. There were, however, four post-high students who accepted employment during the first year. During the second year, FY 67, 38 students were enrolled (16 high school, and 22 post-high). Eight students completed their training, which equals the balance from the first post-high group to enroll, but this does not account for the 12 high school students who started the program.

Considerable more data should have been collected to adequately explain why there were only eight completions from an enrollment of 24. Some possible reasons given were: accepted a job, dropped out of school, changed vocational objective, course was taken on an exploratory basis, required courses for graduation kept student from taking additional training, etc. A spot check of other area vocational-technical school directors verified similar completion numbers and reasons for non-completion.

Enrollm and completion data from the ten school that reported, which was taken from Tables XXII, XXIII, and XXIV, is presented below.

| | Enrollment | Completion | |
|---|---|---|---|
| | | No. | % |
| 65 | 1920 | 599 | 31.19 |
| 66 | 2972 | 1042 | 35.06 |
| 67 | 3975 | 1078 | 27.11 |
| Total | 8867 | 2719 | 30.66 |

Concerning placement of the 2719 students who completed training, directors reported that 1698 (62.44%) were placed in jobs related to their training. Again, more data would have been necessary to determine the percent who continued their education elsewhere, entered military service, accepted employment in a job not related to their training, were placed after the October 15 State reports were completed so were not counted, etc.

Information was secured to determine what portion of graduates entering jobs related to their training went to work in Kansas, and how many were still working in Kansas on jobs related to their training one year later. The data which follows shows frequency and percentage relationships.

| | Job Related to Training | Job Placement in Kansas | | Continuing on Jobs Related to Training in Kansas One Year Later | |
|---|---|---|---|---|---|
| | | No. | % | No. | % |
| 65 | 256 | 146 | 57.03 | 130 | 54.9 |
| 66 | 541 | 472 | 87.2 | 304 | 56.2 |
| 67 | 901 | 842 | 93.5 | -- | -- |

When compared with students, who were reported as completing their training, the following relationship was developed.

| | Number Completing Training | Job Placement in Kansas | | Continuing on Jobs Related to Training in Kansas One Year Later | |
|---|---|---|---|---|---|
| | | No. | % | No. | % |
| 65 | 599 | 146 | 24.37 | 130 | 21.8 |
| 66 | 1042 | 472 | 45.3 | 304 | 29.2 |
| 67 | 1078 | 842 | 78.1 | -- | -- |

Salary information was incomplete. Mean salary information for the "low" and "high" starting salaries are presented in chart form for graduates from each fiscal year. Salaries reported one year later are included for graduates from the same program for FY 65 and FY 66.

| | | Starting | One year later |
|---|---|---|---|
| 65 | low | $3007 | $3771 |
| | high | 5901 | 6400 |
| 66 | low | 1956 | 2064 |
| | high | 7809 | 8630 |
| 67 | low | 2000 | ---- |
| | high | 8000 | ---- |

The low mean starting salaries reported above for fiscal years 65, 66, 67 were for auto mechanics, agriculturally related, and food services and housekeeping occupations respectively. The high mean salaries for the same period were reported for heavy equipment, heavy equipment and drafting, and technical drafting occupations respectively for the three-year period.

High School and Post High School Enrollment in AVTS by Fiscal Years

The number of the high school and post-high school students enrolled in each of the area vocational-technical schools by fiscal years is given in Table XXV. Voids indicate that no programs were available to students during that fiscal period.

TABLE XXV - HIGH SCHOOL AND POST HIGH SCHOOL STUDENT ENROLLMENT IN AVTS BY FISCAL YEARS

| | 1965 | | 1966 | | 1967 | | Total | |
|---|---|---|---|---|---|---|---|---|
| | HS | PH | HS | PH | HS | PH | HS | PH |
| Atchison | | | | | 22 | 0 | 22 | 0 |
| Beloit | 112 | 39 | 54 | 89 | 56 | 197 | 222 | 325 |
| CKAVTS | 345 | 157 | 408 | 203 | 421 | 221 | 1174 | 581 |
| Dodge City | | | 265 | 93 | 254 | 218 | 519 | 311 |
| Emporia | | | 140 | 41 | 150 | 70 | 290 | 111 |
| Goodland | 76 | 104 | 70 | 198 | 65 | 256 | 211 | 558 |
| Manhattan | | | 70 | 21 | 187 | 80 | 257 | 101 |
| Salina | | | 118 | 81 | 147 | 135 | 265 | 216 |
| SEKAVTS | 579 | 254 | 499 | 284 | 480 | 308 | 1558 | 846 |
| Topeka | 253 | 1 | 190 | 0 | 229 | 0 | 672 | 1 |
| Wichita | | | 618 | 17 | 921 | 443 | 1539 | 460 |
| Total | 1365 | 555 | 2432 | 1027 | 2932 | 1928 | 6729 | 3510 |

From Table XXV, it will be noted that, with two exceptions (Beloit and Goodland) area vocational-technical schools served more high school students than post-high school students. The post-high enrollment in some schools was quite minimal. For example, the Atchison AVTS started its drafting program with 22 high school students and no post-high students in FY 67. During the FY 65 through FY 67 period, the Topeka area vocational-technical school reported only one post-high school student enrolled.

An analysis of total enrollment in the 11 schools showed a ratio of 1:1.91 post-high school enrollees to high school enrollees.

## Average Placement Time

To gain some understanding concerning the length of time between completion of training and job entry, AVTS directors were requested to supply placement information for graduates from programs conducted during fiscal years 1966 and 1967. Data from programs which were reported appears in Table XXVI - Average Placement Time in Weeks for Graduates.

TABLE XXVI - AVERAGE PLACEMENT TIME IN WEEKS FOR GRADUATES

| Name of Program | Av. Placement Time 1966 | 1967 |
|---|---|---|
| Agricultural | 1.2 | 0.8 |
| Auto Mechanics and Body | 0.85 | 0.85 |
| Business, Office, and Distributive Education | 1.33 | 1.16 |
| Carpentry and Cabinet Making | 2 | 1 |
| Child Day Care and Clothing Services | 2.33 | 2 |
| Cooperative Industrial Training | 0 | 0.5 |
| Cooperative Retail Selling | 0 | 0 |
| Cosmetology | 1 | 1 |
| Data Processing | - | 0 |
| Diesel Mechanic | 2 | 1 |
| Drafting | 1 | 1 |
| Electricity and Electronics | 1.66 | 1.64 |
| Farm Mechanics | 1.33 | 1.33 |
| Food Service | 2 | 2 |
| Heavy Equipment | 1 | 1 |
| Machine Shop | 0.60 | 0.40 |
| Photography | 0 | 0 |
| Practical Nursing | 1 | 1 |
| Printing | 1 | 0.5 |
| Truck Driving | 1 | 1 |
| Welding | 1.50 | 1.25 |

# CHAPTER

# IV

# SUMMARY

The study was designed to provide to the State Board for Vocational Education information concerning various aspects of Kansas area vocational-technical schools.

The Vocational Education Act of 1963, and State legislation (Senate Bill No. 438) provided the basis for programs of vocational-technical education in area vocational-technical schools.

Survey instruments mailed to the area school directors, and AVTS school records in the office of the State Board for Vocational Education were the major sources of data used in the study.

Letters or materials received from state directors of vocational education provided some information concerning the functioning of area vocational schools in other states. Features of state programs represented in that information appears in the appendix.

Of the 14 AVTS in Kansas, 13 (92.84 per cent) responded to the mailed instrument. Some of the schools did not furnish complete information for certain items on the instrument.

An analysis of types of schools and number of personnel for fiscal year 1968 disclosed ten (71.43 per cent) Type I, and four (28.57 per cent)

Type II area vocational-technical schools. The number of personnel averaged 1.98 administrators, 18.57 full-time and 0.36 part-time instructors, 3.4 clerical, and 2.25 other staff members for FY 68.

From the data concerning participating school districts by fiscal years, it was found that six area schools served 48 participating school districts for an average of 8.0 in FY 65. In FY 66, 82 districts participated in nine area schools. The average figure increased to 9.11 per AVTS that year. Only 71 districts participated in the same nine area schools in FY 67. The average dropped to 7.89 participating districts per school that year, showing the effects of school unification. During FY 68, 80 districts were reported as participating in ten schools, averaging 8.0 districts per AVTS.

Federal, State, and local monies, tuition, fees, gifts, and bonds support the establishment and operation of AVTS. The total budget for six schools in FY 65 was $1,898,537.79. In FY 66, the total budget for 10 area schools was $3,093,154.46. The 12 AVTS budgets amounted to $3,947,199.02 in FY 67. During FY 68, 14 area schools reported budgets of $7,784,430.10.

Although the trend was toward increased budgets each fiscal year, there were instances where significant reductions were reported by individual schools for one year. Conversely others reported a noteable increase for one or more years.

Where area schools do not own land and buildings, programs are

conducted in local school district facilities. The investment ratio between equipment and building inventory was 1:1.02.

Total reported investment in land, buildings, and equipment in the 13 AVTS was $8,830,972.69.

For FY 68, the eleven area schools reported a total of 244 instructors engaged in 48 major program offerings. Regarding the instructors educational background, the following composite figures were obtained: 37 with H.S. diploma; 5 A.A. degree; 74 B.S. degree; 67 M.S. degree; 42 - some college; and 3 - specialized training. The data showed considerable fluctuation in instructor qualifications within the programs. As an example, in auto mechanics there are 29 instructors who are teaching the same type of program in 11 area schools. Among them are 10 with a H.S. diploma; 1 - A.A. degree; 3 - B.S. degree; 8 - M.S. degree; 3 - some college; and 4 - specialized training. Also, the average years of teaching experience in education (whether in specialized programs or AVTS) and related work experience varied greatly from program to program.

Time for completion of the programs ranged from 180 hours to 2160 hours (9 months to 27 months). A great variation was also observed in time for completion of the same type of program from one school to another.

In most of the programs, student qualifications (except requirement of minimum age required by law for specific occupations or training programs) for enrollment was reported as "none", but in a few programs

(such as photography) a student must have become at least a high school junior to be eligible to enroll.

In FY 65, five area schools reported a total of 1,920 students enrolled. Among them were 71.09 per cent high school and 28.91 per cent post-high school students. By sex 76.09 per cent were male and 23.91 per cent female. The findings showed that only 31.19 per cent completed their program and 42.74 per cent of them entered jobs related to their training in 1965.

With 2,972 enrollees in various programs in 1966, 70.55 per cent were high school students and 29.45 per cent were post-high school. For this group 77.22 per cent were males and 22.78 per cent were females. Of the 35.06 per cent (1,042) graduating that year, 51.91 per cent (541) entered jobs related to their training.

The 3,975 persons enrolled in the different vocational-technical programs for FY 67 included 62.59 per cent high school and 37.41 per cent post-high school students. For this year 70.06 per cent were males and 29.94 per cent were females. Only 27.11 per cent of (1,078) the total enrollees completed the training program in 1967 and 83.58 per cent (901) of that number entered jobs related to their training.

The reported starting mean annual salary for the 1965 graduates was $3,817.71. By 1966, the starting mean annual salary decreased to $3,751.90. The 1967 graduates reported a slightly lower starting mean

annual salary ($3,544.08) than preceding graduates.

Total enrollment by programs reported by ten area vocational-technical schools for the three-year period was 8,867; by classification two-thirds were high school students. Of the 8,867 enrolled, 2,719 (30.66 per cent) were reported as having completed their training (graduated). Of the 2,719 who completed their training, 1,698 (62.45 per cent) were placed in jobs related to their training.

For fiscal years 1965 and 1966 job placement of graduates in Kansas was 24.37 per cent and 45.3 per cent, respectively. One year later, 21.8 per cent of the 1965 graduates and 29.2 per cent of the 1966 graduates were in jobs related to their training. Of the fiscal year 1967 graduates, 78.1 per cent took jobs in Kansas. Average placement of graduates in Kansas for the three-year period was 53.69 per cent.

Information on placement time for the graduates of various vocational-technical programs was reported by seven area schools. Responses showed that the majority of the post-high school students were employed immediately after the completion of training. In most of the programs the average time between program completion and first job entry ranged from 1.5 to 2.5 weeks in 1966 and 1967. In some cases students were reported as having secured employment prior to completion of the training program.

# CHAPTER

# V

# CONCLUSIONS

From this preliminary study of Kansas area vocational-technical schools, it is concluded that:

1. Some school districts do not participate consistently in AVTS programs.

2. Because of unification, actual numbers of school districts was not an adequate measure of their participation by fiscal years.

3. The data for the 1.89 million dollar budget for 6 AVTS in FY 65 and the 7.78 million dollar budget in FY 68 did not give budget use, only sources of funds.

4. There was a lack of uniformity in time allocated for completion of similar programs among schools.

5. Some program titles reported by area vocational-technical schools lacked clarity, nor were they always consistent with those listed for a particular school by the Kansas State Board for Vocational Education.

6. Persons having a broad range of educational and work experience backgrounds can meet the requirements for teaching in AVTS programs.

7. The variables resulting in significantly low percentages of students completing programs were not adequately identified and quantified. Additional categories of information would have resulted in more meaningful

findings.

8. Placement and follow-up information of graduates from AVTS was limited.

9. AVTS programs have been structured more for high school students than post-high school students by a ratio of 2:1.

10. Graduates have experienced little difficulty in securing employment.

11. Since there are some common traits in (Kansas State Board for Vocational Education) Form VE-4 Placement and Follow-Up of Graduates, Form VE-6 Organization Enrollment Report, Form VE-7 Yearly Closing Enrollment Report, and (State of Kansas, Department of Public Instruction) Form AV98-B Area Vocational-Technical School Director's Organiation Report, a multiple carbon copy form should be designed to provide cumulative information for the required reporting periods.

# CHAPTER

# VI

# RECOMMENDATIONS

From this preliminary study, it is recommended that:

1. A new participating district system should be implemented, which complies with the purpose of equalized educational opportunity for persons of all ages.

2. Time for completion of similar training programs should be standardized.

3. Identical titles should be assigned by the Kansas State Board for Vocational Education to programs having similar courses of study, and the assigned titles should be used by AVTS.

4. Provision should be made by the State Board for experimental development, and demonstration programs (pre-vocational-technical and vocational-technical) for meeting the needs of students and the labor market. Such programs should not be based on traditional semester blocks of time.

5. More comprehensive studies be conducted to show reasons for non-completion of programs, more complete placement and follow-up information, relationship of program offerings to need, and a cost benefit analysis.'

6. Cooperative teaching and team teaching should become more universal to maximize teacher potential.

APPENDIX

## FEATURES OF AREA VOCATIONAL SCHOOL PROGRAMS
Reported by States

### Alabama[1]

Two types of area vocational schools:

1. Ungraded - for out of school youths and adults with varying educational backgrounds
   a. Operated by the State Board of Education
   b. Financed with a special appropriation each biennium
   c. Students enrolled for full-time study

2. Graded - for secondary youths
   a. Operated by city and county board of education
   b. State board of education reimburses 100% of instructor salary and travel
   c. Local fund provides one-half the cost of building and equipment; State other half
   d. Local school system provides all other operating costs
   e. Open to all high schools within reasonable attendance areas

### Alaska[2]

1. Secondary vocational education is conducted in comprehensive high schools

2. Post - secondary programs are offered in community colleges and the University of Alaska

### California[3,4]

All junior colleges and a few high schools which have received construction money have been designated as area vocational schools.

---

1. Letter from J. F. Ingram, Director Vocational Education, July 25, 1967.

2. Letter from Ralph W. Matthews, Acting Assistant Director Vocational Education, July 11, 1967.

3. Letter from E. D. Edington, Director, Research Coordinating Unit, July 14, 1967.

4. Bureau of Junior Colleges General Education. The Junior College's Story. Sacramento: California State Department of Education, 1966, 15 pp.

California (Concluded)

a. Local board determines policy of the colleges or schools
b. Financed by the State's share, State school fund, local tax levy, and special purpose
c. More than 180 courses are offered

Colorado[5]

Any school district, combination of school districts, junior college, or publicly supported four-year institution may be designated as an area vocational education school:

a. If it meets or exceeds the minimum standards and criteria set forth in the policy statement of the State Board.
b. If it receives Federal, State and local funds.

Connecticut[6]

Fourteen regional secondary schools function as vocational schools

a. Operated by the State Department of Education
b. Essentially a three-year program with time divided equally:
   1. 50% to skilled trade training
   2. 50% to general and related education
c. Transportation provided to students under 21 years of age, and to veterans over 21 years of age who reside out of vocational-technical school town
d. Specific sum may be paid for maintenance if the town elects to pay this in lieu of transportation

District of Columbia[7]

The Vocational-Technical Occupational Center (VTO) offers programs for:

a. Out-of-school, high school, post-high school youth and adults

5. Colorado State Board for Vocational Education, Area Vocational Education Schools: (Basis for Designating Area Vocational Education Schools. (Denver) 3 pp.

6. Division of Vocational Education, Trade and Industrial Education in Connecticut.

7. Educational Specifications for the Vocational-Technical Occupational Center, Washington, D. C., Final Report. Palo Alto: Odell MacConnell Associates, 1965, 24 pp.

District of Columbia (Concluded)

b. Supplementing and extending the present secondary educational program to provide more comprehensive and realistic curricula.

## Florida[8]

State Legislature authorized establishment of area vocational-technical centers in 1963 for high school students, out-of school youth, and adults.

a. All day and evening instruction offered in at least five different occupational fields at thirty facilities
   1. Nineteen separate vocational-technical centers
   2. Ten departments of junior colleges
   3. One specialized high school

## Georgia[9]

A system of twenty-nine state and area vocational-technical schools are in operation.

Criteria used by the State Board of Education in locating and establishing a State wide system of area vocational-technical schools were:

a. The attendance area must contain not less than 60,000 in total population
b. A radius of approximately thirty miles shall be considered the attendance area for an area vocational school. One-half the distance between two locations of less than thirty miles shall be considered as the attendance area
c. The combined enrollment of high school grades nine through twelve in the attendance area shall be not less than 3,000
d. No more than one school shall be constructed in any approved location
e. Schools must be located in centers where there is a large and growing population, never in an area where the population is decreasing

8. State Department of Education, A Brighter Future for Floridans Through Area Vocational Technical Centers, Tallahassee, Florida.

9. Uxer, John Elmo. An Operation Research Model for Locating Area Vocational Schools. Las Cruces: New Mexico State University, 1967. 165 pp.

## Georgia (Concluded)

f. Schools shall be located where there is a concentration or expansion of industry.
g. Local school systems must provide a site of not less than ten acres, and 50 per cent of the cost of architectural fees, construction and equipment costs.
h. Local school systems within the attendance areas must have ongoing programs in the vocational areas as a nucleus to build a complete area vocational-technical program
i. The local school system must make an official commitment to provide maintenance and operation of the building
j. Local school systems cannot charge students a tuition fee
k. The school shall provide a minimum of eight training areas
l. Instructional programs shall be designed for occupational competency leading to immediate employment, but not leading to a baccalaureate degree.

## Hawaii[10,11]

1. Area vocational-technical schools are operated for post - secondary students (13th and 14th grades).

2. Program includes one technical school and four community colleges

a. Operated by the Department of Education
b. Supported by the State
c. No tuition charge to residents or nonresidents
d. Equal preference to veterans as well as high school graduates
e. Serve the entire island on which the school is located

## Idaho[12]

The State Board for Vocational Education prefers to associate the area vocational education school with junior colleges or State educational institutions so students may avail themselves of academic courses offered by the school. An area vocational education school must:

10. Letter from Albert J. Feirer, Director, Vocational Post high and Adult Education Branch, July 5, 1967.

11. Division of Vocational, Post High School, and Adult Education. Bulletin of Information and major programs, 1966-1967. Honolulu: Department of Education, State of Hawaii, 1966. 40 pp.

12. Idaho State Board for Vocational Education, Area Vocation Education Schools in Idaho.

## Idaho (Concluded)

a. Provide a minimum of five courses
b. Provide full-time study
c. Enroll students on the basis of aptitude and ability
d. Not limit enrollment to school boundaries
e. Be financed by a combination of Federal, State, and local funds

## Illinois[13]

1. A system of Junior Colleges being established will:
   a. Provide a good percentage of occupational offerings
   b. Receive 75% of the cost of construction from the Junior College Board
   c. Provide State aid in the amount of $11.50 per student semester credit hour, reducing the support from the Board of Vocational Education and Rehabilitation
   d. Strengthen the occupational training concept for postsecondary students

2. The Area Center Concept: (A system of area schools):
   a. To offer occupational programs to students of neighboring schools where these programs are not available
   b. To prorate costs to the student's home school
   c. To have transportation provided by the home school

## Indiana[14]

The State Board of Vocational and Technical Education, State Board of Education, and Indiana Vocational and Technical College Board, all involved in Vocational Education. The Department of Public Instruction, under the State Board of Education:

a. Has a number of area vocational schools under construction
b. Has two cooperative area vocational schools presently in operation

---

13. Letter from Alfred A. Redding, Assistant Director for Vocational Education, July 5, 1967.

14. Letter from Walter J. Penrod, Director of Adult Education, Department of Public Instruction, July 10, 1967.

## Iowa[15,16]

The Area School Act, Senate File 550, provided for the establishment and operation of:

1. Area . community colleges with vocational-training areas
   a. Ten in operation with vocational-technical curricula and first two years of collegiate studies
   b. Serve all postsecondary school age persons
   c. Inadequately educated person must first take lower courses
   d. State Board of Public Instruction and State Board of Regents inspects the standard

2. Area Vocational Schools
   a. Five in operation
   b. State Board of Public Instruction annually inspects offerings of all area schools

Financing area community college and area schools:

a. By Federal, State, and local monies and from tuition
b. State aid based on average daily enrollment of full-time, State residents
c. Each area board can levy a property tax of three-fourths mill for operating funds
d. For a period not to exceed five years voters may also be asked to approve an annual three-quarter mill tax levy for capital outlay
e. Bonding capacity for construction of facilities in local school districts

## Maine[17]

The 102nd Legislature enacted Chapter 440, An Act Relating to the Establishment and Operation of Regional Technical and Vocational Centers. Two plans are provided:

---

15. Howe, Trevor, G., Iowa's Area Vocational Schools and Area Community Colleges." (Cedar Rapids Today): Vol. XXXIV No. 11 (Nov. - 1966).

16. Educational Bulletin. Area Community Colleges and Area Vocational Schools: Progress Report, (Iowa, Department of Public Instruction, February 1967).

17. Letter from John A. Snell, Chief, Bureau of Vocational Education, June 30, 1967.

## Maine (Concluded)

1. Vocational technical centers
   a. Conducted by the State Board of Education
   b. Postsecondary level
   c. Four centers presently in operation
   d. Three schools of practical nursing in operation

2. Regional or area vocational centers
   a. To be administered by local educational agencies in conjunction with comprehensive high schools
   b. Three presently in operation; eleven more approved by the State Board

## Maryland[18]

1. Area Vocational Schools:
   a. An extension of a comprehensive program of studies in the counties
   b. In some cases new centers are attached to a comprehensive high school; in other instances a separate building has been provided
   c. Do not carry a separate administration
   d. Students from a number of high schools are transported

2. Twelve Community Colleges:
   a. Furnishes vocational or technical education on the postsecondary level
   b. Controlled by county board of education
   c. Provides associate arts degree

## Minnesota[19,20]

Area Vocational-Technical Schools:
   a. Twenty-six schools in operation

---

18. Letter from James L. Reid, Director of Vocational Education, July 10, 1967.

19. Letter from S. K. Wick, State Director, Vocational Education, July 24, 1967.

20. Minnesota's Area Vocational Technical Schools 1966-1967. St. Paul: Department of Education.

## Minnesota (Concluded)

b. Tuition free to high school students, high school graduates under 21, high school dropouts over 18, and returning veterans
c. Tuition for nonresidents and students over 21 years of age based on the per pupil costs of the school
d. Evening classes are designated to upgrade or retrain persons presently employed or temporarily unemployed
e. Most of the financing is from Federal and State funds.

## Mississippi[21]

Area Vocational Schools:

a. Through existing junior college system
b. Entire state is divided into 17 junior college districts
c. Open to all students, from high school dropouts to the highly skilled and technical levels
d. Administered by each of the 17 Boards of Trustees

## Nebraska[22]

Legislative Bill 581, enacted on August 7, 1965:

a. Provided for the establishment, operation, and financing of a state system of area vocational-technical schools.
b. Four schools in operation, one scheduled to start in Fall, 1968; and one has been voted by more than 80% of voters on June 27, 1967.

## Nevada[23,24]

Has not really developed a full program of Area Vocational Technical Schools.

Southern Nevada Vocational-Technical Center:

---

21. Letter from A. P. Fatherree, Director, Division of Vocational and Technical Education, July 7, 1967.

22. Letter from Glen H. Strain, Coordinator, Vocational Education Division, July 7, 1967.

23. Letter from John W. Bunten, Assistant Superintendent, Vocational-Technical and Adult Education, July 11, 1967.

24. Brochure on Southern Nevada Vocational Technical Center.

## Nevada (Concluded)

a. Started in September, 1966
b. Primarily a full-time secondary school program
c. A part-time program for students who plan to attend college but wish to take special courses

## New Mexico[25]

Vocational education taught:

1. In junior colleges
   a. Not to exceed two years of a vocational and technical curriculum
   b. For persons who may or may not have completed the twelfth grade

2. In technical and vocational institution:
   a. Maximum of two years of vocational and technical curriculum
   b. In addition, some appropriate courses in the arts and sciences

3. Area Vocational Schools:
   a. Provided by House Bill No. 50, 1967 - Chapter #177
   b. Designated by the State Board of Education
   c. Financed by the combination of Federal and State monies tuition and fees, and a tax levy (not exceeding five mills for establishment and operation of area school).

## North Carolina[26,27]

State-level administration and supervision of institutions is performed by a department created by the State Board of Education. Each institution has a twelve member board of trustees for local-level control.

25. Schrader, Gene. Procedures for Establishing Area Vocational Schools in New Mexico. Santa Fe: New Mexico Occupational Research and Developmental Coordinating Unit, State Department of Education, July, 1967. 52 pp.

26. "Community Colleges, Technical Institutes, and Industrial Education Centers" Public School Laws of North Carolina. Chapter 115A, General Statutes of North Carolina, including Amendments adopted by the 1965 General Assembly, 21 pp.

27. A Guide for the Establishment of Comprehensive Community Colleges in North Carolina. Raleigh: Department of Community Colleges, State Board of Education. 47 pp.

North Carolina (Concluded)

1. Community College:
   a. First two years of regular college studies
   b. Organized curricula for training of technicians
   c. Vocational programs of less than technician level
   d. General adult education

2. Technical institute:
   a. Two years technician program
   b. Vocational, trade, and technical programs
   c. General adult education and community services

3. Industrial education center:
   a. Vocational program
   b. General adult education

Financial support - State (Not more than $500,000 to any single institution for capital outlay), Federal, local, student tuition and fees, and issuance of bonds (for capital outlay only)

Ohio[28]

Joint vocational school districts:
   a. Territory of two or more school districts within a county
   b. Managed and controlled by the joint vocational school district board of education
   c. For post-high school training, technical training, and retraining programs in vocational education
   d. One of the following is the minimum standard for admittance:
      1. Student with high school diploma
      2. Student with an age and schooling certificate
      3. Student who received a certificate of exemption from the compulsory attendance laws under the standards adopted by the State Board
   e. Financed by Federal and State monies, tax levy (may issue notes for one-half of the anticipated revenue of a tax levy, voted for a specified period of years not exceeding ten, for the purpose of erecting or enlarging buildings and purchasing equipment), bond issue (for site, building, and equipment), and tuition.

28. "1963 School Law Supplement." Statues Concerning Joint Vocational School Districts. Columbus; State Department of Education. 11 pp.

## Oklahoma[29,30]

State Question 434 in 1966 made it legal for the State and local districts to establish area vocational-technical schools.

a. Five area schools are in operation
b. Supervised by area school board
c. Besides student ability, aptitude, and interest, general education is important for enrollment
d. Three classes of students:
   1. High school student will spend one-half day at the area school and one-half day at his local high school. Credits earned in area school will count toward graduation from his home high school.
   2. Full-time training programs offered for post high school students
   3. Evening classes available for adults
e. An area school district may operate a transportation system for students.
f. Local agency must provide at least 50% of the cost of buildings, sites, equipment, and operating cost.
g. Federal funds also available for matching up to 50% of all costs.
h. Non-resident tuition charge must be approved by the State Board for Vocational Education.

## Oregon[31]

Area Vocational-Technical Education:

a. Through community colleges
b. Ten institutions are in operation
   1. Three were operated by local school districts.
   2. Seven were organized within area education districts (more than one school district) and offer comprehensive programs, including both lower division collegiate and vocational-technical preparatory work.
c. 137 vocational-technical programs, representing 56 separate occupations, were offered in 1965-66.
d. Adult education courses were also offered.

29. A New Concept in Vocational-Technical Education in Oklahoma. Stillwater: The State Board for Vocational Education. 11 pp.

30. "Area Vocational-Technical Education," Vocational Education Operational Policies and Procedures (Stillwater, Oklahoma), 8 pp.

31. State Board of Education. Oregon Community Colleges: Annual Report. Salem: State Department of Education, 1965-'66. 38 pp.

## Oregon (Concluded)

e. Operation cost - State reimburses 85% of the difference between operating expenses and the amount received from tuition and fees, or two-thirds of the unit cost (operating cost of an institution divided by its total full-time student enrollment) up to a maximum of $433 per full-time enrollment (exclusive of federal funds for vocational education), which ever is less. If an area education district offered vocational-technical programs in which the net operating cost was $511 per full-time student enrollment or higher, Senate Bill 34 made provision for using Federal vocational funds as supplemental aide to such institutions.

f. Local taxes levied for operation and capital outlay.

## Rhode Island[32]

State Legislature in February, 1964 and April, 1964 made funds available for expansion of vocational training opportunities.

a. Eight new secondary vocational-technical facilities have been proposed
b. Three post - secondary programs operate in conjunction with State Junior Colleges
c. Local administration for all area schools except one which is State operated
d. Length of courses vary one, two, or three years
e. Aptitude, achievement, and intelligence tests are considered for enrollment
f. Students below grade ten are not admitted to area vocational schools
g. Programs in evening adult vocational-technical education are in operation
h. Financed from State and Federal funds, and from tuition

## South Carolina[33,34]

Vocational instruction:

a. Fourteen area vocational schools either in operation or under construction (aim - 51 schools by 1972 serving all areas of the state)

32. Administrative Plan for Vocational Technical Education in Rhode Island. Providence: Rhode Island State Department of Education. 6 pp.

33. Vocationally Trained Citizens in a World of Changing Technology. Columbia: The Division of Vocational Education, Revised January, 1966. 32 pp.

34. South Carolina Area Vocational Schools: A New Concept in Vocational Education. Columbia: State Department of Education, Revised. May, 1967.

South Carolina (Concluded)

b. An integral part of secondary school programs
   1.) Available to all students in area served by vocational school
   2.) Transportation provided from home school to area school
c. Post secondary programs provide full-time study
d. Many adult programs offered at night
e. Financed from Federal and State funds and by local school district
f. Transportation is provided their home school to area school
g. Work-Study program in Vocational Education is operated by the local school district
h. Aim - construction of 51 area schools by 1972 to serve all areas of the State, and to improve existing vocational facilities at local high schools
i. Cooperatively financed by the federal and State Government and the local school districts

South Dakota[35]

The 1965 session passed S. D. House Bill 502 and 668 for establishment and operation of Area Vocational Schools.

a. Six service area schools within the State
b. Area boundaries do not prohibit one district from contracting with any other district in the State for vocational training
c. Area vocational education school includes four categories of institutions:
   1.) Specialized high school
   2.) A department of a high school providing education in less than five different occupational fields
   3.) A technical or vocational school
   4.) A department or division of a junior college, community college, or university which provides no less than five different programs
d. Adult vocational instruction offered during the evening or at other times when workers are not employed
e. Vocational funds provided by the State and Federal governments, and tuition charged
f. Tuition rate for high school students

35. Oleson, Emmett B. (Ike). "The Developing Plans for Vocational-Technical Training in South Dakota," SDEA Journal: September, 1966. pp. 34-39.

## Tennessee[36]

House Bill No. 633 authorized The State Board for Vocational Education to establish and operate:

1. A state wide system of area vocational-technical schools
   a. Any part of the State within reasonable distance to school
   b. To serve post-high school youth, school dropouts, high school youth, adults, the handicapped, older workers, apprentices, other employed learners, and employed workers

2. Regional technical schools
   a. Two-year terminal training centers
   b. Train engineering technicians for industry - production, distribution, or service

Financed from Federal, State, and local funds.

## Texas[37,38]

House Bill 490, Acts, Fifty-ninth Legislature:

a. Provided a county-wide vocational school district
b. Authorized the Texas Education Agency to designate one or more school districts in a county as an area vocational school (s)
c. Outlined criteria for designating a public school district as an area vocational school:
   1.) Size of the area in square miles
   2.) Number of public school districts in the county, or adjoining counties
   3.) Number of available eligible students for enrollment
      a. Minimum age - 14
      b. General education prerequisites

36. "Division of Vocational Education." House Bill No. 633. Nashville: Department of Education, March 22, 1963. 4 pp.

37. "Department of Vocational Education." Policies Governing Approval of Public School Districts as Area Vocational Schools. Austin: Texas Education Agency. 7 pp.

38. "House Bill 490" An Act. Austin: Texas Education Agency. 3 pp.

Texas (Concluded)

d. Proposed area school will operate:
   1.) As a technical or vocational public institute used exclusively for vocational education
   2.) As a department of a public junior college, State colleges, or university which provides vocational-technical education
   3.) With a minimum of thirty students in each proposed program in the initial year of operation of an area vocational school (future enrollment at least equal to initial enrollment)

Financed by Federal, and State monies, and from county-wide vocational school tax (not exceeding 20¢ on the $1000 of assessed valuation of taxable property

Utah[39,40]

General statement of the State Board for Vocational Education.

a. Vocational programs should be an integral part of comprehensive high school programs.
b. Vocational homemaking, office occupations, and distributive education should be conducted in all high schools
c. All rural high schools with enrollments of 100 or more which are located in farming communities should have programs of vocational agriculture
d. Smaller high schools may conduct such courses where job opportunities in the community are sufficient to support community programs

1. Area Vocational Centers:
   a. 11th and 12th grade students enrolled
   b. 10th grade students could be enrolled upon recommendation of the student's principal
   c. Credit earned in the area centers will be counted towards graduation from attending school

2. Post-secondary training in area vocational centers

39. Recommendations for the Establishment of Area Vocational Centers in Selected High Schools. Salt Lake City: Utah State Board for Vocational Education. 4 pp.

40. Area Vocation Centers. Salt Lake City: State Board for Vocational Education, May, 1967. 10 pp.

## Utah (Concluded)

a. For adults and high school graduates
b. Offered during the school year and in Summer

3. Adult level vocational training in area vocational centers:
   a. May be conducted in a comprehensive high school
   b. Offered in afternoon, evening, Saturday, and in Summer classes

4. The University extension center for continuing education:
   a. Located in high school where the area vocational center is located
   b. May also offer college level instruction in humanities, liberal arts and sciences

5. Designation of junior colleges as area vocational centers:
   a. For 11th and 12th grade students as well as regular junior college students and adults
   b. Joint school district and college financing

Financial Considerations:
   a. Non-participating district would pay the district operating the area center on the same basis as though the student were attending school in the district in which the center is located
   b. Federal and State funds available to the district in which the center is located

## Vermont[41,42]

Area Vocational Centers offer programs at the secondary level.

1. Vocational education provided in comprehensive high schools rather than specialized vocational schools:
   a. Minimizes splitting young people into groups according to the school they attend
   b. Gives vocational students an opportunity to take their academic courses at as high a level as they are capable

41. Letter from Cola D. Watson, Director, Vocational-Technical Education, August 4, 1967.

42. "Vocational Division." Policies for Development of Vocational Education in Vermont. Montpelier: Department of Education. 3 pp.

## Vermont (Concluded)

c. Saves materially in capital costs

2. State Board of Education designate certain high schools as area vocational centers:
   a. Centers will offer no fewer than five programs
   b. Courses for adults will become important part of this offering
   c. Courses available for 11th and 12th grade students

3. The only post-secondary vocational-technical programs in the state at the present time are offered by Vermont Technical College, which is administered by the Vermont College Board.

Financing:
   a. Federal and State funds used extensively for facility construction and for equipment to complement local funds
   b. Area program reimbursed at rate of 50 per cent the first year, 40 per cent the second year, and 25 per cent each year thereafter (full-time local director and full-time guidance counselor required).
   c. Tuition
      1.) Paid by home district for students attending from district without a high school
      2.) Paid on 50 per cent matching basis (State and home district) for students attending from district with a high school

## Virginia[43]

1. Vocational education centers operated under the State Board of Education, as area vocational-technical schools:
   a. Provides programs for high school credit
   b. Serves the high school youth of the area

2. State Board for community colleges has responsibility:
   a. For post-secondary vocational-technical education
   b. For high school dropouts who are eighteen years of age or older
   c. For high school graduates
   d. For adults who are available for full-time training
   e. Includes two years of college transfer courses

43. Letter from L. A. Hill, Coordinator, Vocational Education, July 18, 1967

## Virginia (Concluded)

This plan prevents the use of any facility for a combination of high school and post high school students.

Financing:

a. Federal, State, and local partnership
b. Applies to both capital outlays for building costs and equipment, and to the cost of operation

## Wisconsin[44]

Schools of vocational, technical and adult education meet the varied needs of people through:

1. The junior college
2. The technical institute
3. One and two - year vocational programs
4. Special vocational programs
5. A variety of special educational services

General information:

a. Fifteen technical institutes in operation
b. Forty-eight schools of vocational, technical, and adult, and vocational evening schools in operation
c. Prerequisites for enrollment vary
d. Financing:
   1.) Federal, State, and local funds
   2.) No tuition for participating community
   3.) Tuition for non-resident students charged by local school. Persons under twenty-one years of age who do not live in a community with a vocational school program will have their tuition paid by the county of their residence.

44. Opportunities Through Education in Wisconsin Schools of Vocational, Technical and Adult Education. Madison: State Board of Vocational, Technical and Adult Education, October 1966, 16 pp.

*ADULT VOCATIONAL EDUCATION; EMPLOYMENT EXPERIENCE; PROGRAM COSTS; *PROGRAM EFFECTIVENESS; *PROGRAM EVALUATION; *COST EFFECTIVENESS; FEDERAL LEGISLATION; STATE LEGISLATION; STUDENT CHARACTERISTICS; FEDERAL PROGRAMS; STATE PROGRAMS; VOCATIONAL TRAINING CENTERS; ON THE JOB TRAINING; EDUCATIONAL PROGRAMS; FEDERAL STATE RELATIONSHIP; TABLES (DATA)
*MANPOWER DEVELOPMENT AND TRAINING ACT PROGRAMS; NEW YORK; MDTA PROGRAMS;

Two basic objectives of this study were to evaluate state-operated manpower training programs (based on a representative sample of 25 selected programs) on a cost-benefit relationship basis and to evaluate a larger universe of state-operated programs from a cost-effectiveness viewpoint. The latter portion of the survey included most (310) of the institutional programs completed since 1962 and all on-the-job training (OJT) projects from 1963 through 1967 which were developed by the staff of New York's Division of Manpower. Among the highlights of the study were: (1) For institutional trainees, the average earnings gain was 54 cents for every dollar invested by the government in training, (2) For OJT trainees, the earnings gain was $2.10 for every dollar invested by the government, (3) The educational level of trainees dropped steadily (over 47 percent lack a high school diploma), and younger persons, aged 19 to 34, made up the largest group among the trainees, (4) 72 percent of the institutional trainees who completed training had a job at the time of the last report to the Division of Employment, while 92 percent of the OJT trainees were employed at the completion of their training, and (5) 50 OJT contracts involving 118 projects, and more than 20 different institutional training programs are now underway as a result of state financing. Also included are tables, the legislative background of manpower training, part of the State Manpower Training Act, a description of trainee characteristics, and findings of other cost-benefit studies. ## HIGHLIGHTS OF THE STUDY

### An Investment in Manpower Training Yields High Return

On the average, the institutional trainees studied increased their annual earnings by $1,180 or 84.8% during the first year following completion of training. Compared to the cost of training, the increase represents an average first year earnings gain of 54¢ for every dollar that government invested. OJT trainees experienced an average first year earnings gain of $1,378 after completion of training. Compared to the relatively lower cost to the government of OJT training, the increase represents an average first year earnings gain of $2.10 for every dolla invested by government. See abbreviated summary on the following page, and for full details, see the tables on pages 72 and 73 in Section VII.

### Manpower Training is Reaching the Hard Core Disadvantaged Person

Currently, more than 50% of the MDTA institutional trainees are Non-White. The educational level of trainees has dropped steadily (over 47% lack a high school diploma) and younger persons, aged 19 - 34, make up the largest group among the trainees. Descriptions of the characteristics of institutional and OJT trainees can be found in Section V beginning on page 18 .

### A High Proportion of the Persons Completing Training Get Jobs

72% of the institutional trainees who completed training had a job at the time of the last report to the Division of Employment. 92% of the OJT trainees were employed at the completion of their training. Additional details regarding the costs of manpower training, both institutional and OJT are contained in Section VI beginning at page 37 .

### Training under the State Manpower Act is Beginning to Assume Sizeable Proportions

Fifty OJT contracts involving 118 projects, and more than 20 different insti tional training programs are now underway as a result of State financing. Tables describing the scope and volume of State Manpower Act Training programs can be found Section IV beginning at page 11 .

COSTS AND BENEFITS OF SELECTED MDTA INSTITUTIONAL AND OJT PROJECTS, NEW YORK STATE, 1963-1967

| | $125,300[c] | $263,058[c] | - |
| | $ 656[d] | + $ 1,378[d] | 2.101 |

a - Data for the three multi-occupational courses, which were not completed at the time of this study, are calculated on the basis of estimated approved costs and training slots.

b - This is a ratio expressing the relationship between the earnings difference resulting from training, and the total average training cost per completer. For example, in the Licensed Practical Nurse Project, New York City, thirty cents in increased earning power were returned per dollar cost of the Project, in the first year alone.

c - Actual total costs or earnings of all selected courses.

d - Results from division of total actual costs or earnings by 475 institutional trainees completed, and 191 OJT trainees

e - Difference between earnings one year before training, and one year after training.

# EVALUATION AND BENEFIT-COST RELATIONSHIPS OF MANPOWER TRAINING PROGRAMS IN NEW YORK STATE

## SECTION I - INTRODUCTION

### Objectives

Education has economic value; it represents a form of investment in human beings. Several studies have offered the conclusion that there is a correlation between education and income, and between education and unemployment. One popular estimate of the difference in lifetime income between a high school graduate and a college graduate is close to $140,000. A similar income differential may be noted when comparing persons having specific vocational training with persons having no specific occupational preparation.

Relatively little research effort has been devoted to the efficacy of vocational training on a cost-benefit basis, except for isolated research of retraining programs. The immediate stimulus for this survey was a series of questions posed by the Division of the Budget with respect to manpower training programs operated by State agencies. The questions revealed three areas of interest: a) the relationships between trainin programs and the needs of individuals for training; b) the efficiency with which the various programs accomplished their objectives, and; c) the benefit-cost relationships involved. Questions regarding particular training needs and the progress of State-funded programs also were asked.

A basic objective of this study was to evaluate selected State-operated manpower training programs, on a benefit-cost relationship basis. Another objective was to evaluate a larger universe of State-operated programs from a cost/effectiveness viewpoint. Both evaluations were preceded by a review of the characteristics of trainees.

Hopefully, this study begins the development of a framework within which immediat and long-range policy determinations and funding decisions can be made by the State of New York in the manpower field.

## Scope

The scope of this study, conducted within the extremely narrow time limits, is confined to:

1. Describing the legislative background leading to the present status of public-funded training programs;
2. Developing a series of statistical tables on trainee characteristics, costs, benefits and other existing data regarding MDTA and the State Training programs to date, from which meaningful evaluative material may be derived;
3. Analyzing in depth selected representative programs to provide benefit-cost relationships of manpower training;
4. Presenting abstracts of other cost-benefit studies of manpower training.

# SECTION II - LEGISLATIVE BACKGROUND

## Vocational Education

Until the early years of this century, the nation's need for trained, skilled manpower was met largely by the immigration of European journeymen. In 1917, the Smith-Hughes Act provided annual Federal funds to the States for vocational education in agriculture, home economics and trade and industry in secondary schools. The George-Barden Act of 1946 supplemented the earlier Act and provided for part-time and evening courses for adults in the distributive occupations. The National Defense Education Act of 1958 provided for assistance to States and localities in training for skilled technicians in occupations requiring scientific and technical knowledge. The recent Vocational Education Act of 1963 increased the scope and effectiveness of the Federal-State system of vocational education, removing some of the prior occupational limitations, encouraged counseling services, authorized programs for those not previously covered, and set up a mechanism for close Education-Employment Service cooperation in developing vocational training programs in skills needed by business and industry.

MDTA

The Manpower Development and Training Act of 1962, a significant new piece of manpower legislation emerged from public awareness of the manpower challenge facing the nation. It represents a new approach within the concept of an active manpower policy by providing a State-Federal cooperative partnership for developing remedial and skill training programs to meet the occupational needs of industry and the individual training needs of the unemployed and underemployed. The State of New York has recognized, supported, and built upon this concept by enactment of its own State Manpower Training Act through Section 23-A of the Labor Law.

Other Manpower Legislation

Through the MDTA and other recent legislation, the Congress has increasingly emphasized the importance of manpower development programs as a means of promoting th welfare of the worker and furthering the Nation's progress. The Area Redevelopment Act of 1961 provided for training unemployed and underemployed workers in economicall depressed redevelopment areas. In 1962, certain parts of the Trade Expansion Act authorized job training for workers laid off or working only part time because of increased imports resulting from trade concessions. Under the Economic Opportunity Act of 1964, education and training have been included among the weapons in the war against poverty. The MDTA amendments of 1963, 1965, and 1966 added significant provisions to increase the Act's effectiveness.

Goals of MDTA

Basically the MDTA provides that the Federal Government, in partnership with State Governments, will:

1. Identify present and future manpower shortages,
2. Seek out persons who can be qualified to fill these shortages through education and training,
3. Take steps to assure that workers of all ages are trained and available to meet shifting employment needs.

Originally MDTA was directed toward alleviating skill shortages and training program were confined to occupations where there was reasonable expectancy for employment. has been re-directed to provide training to the hard-core unemployed and disadvantag

persons who require special individual assistance to make them employable. Several other features of the original Act have been modified by amendments. A chart of the basic changes in the Act follows.

TABLE 1 - BASIC CHANGES IN MDTA PROVISIONS AND CONCEPTS

| | Training Program Directions | Trainee Target Groups | Types and Methods of Training | Eligibility for and amount of Allowances | Other |
|---|---|---|---|---|---|
| 1962 | 1. Shortage occupations with reasonable expectancy of employment. | 1. Unemployed and underemployed.<br>2. 25% training funds to youth programs. | 1. Specific occupations in class-sizes.<br>2. Institutional or OJT | 1. Average weekly wage or UI rate.<br>2. Youth (19-21) - $20.<br>3. Three years gainful work.<br>4. Head of family<br>5. Duration to 52 weeks.<br>6. Subsistence and travel allowances beyond commuting distance. | 1. Funding - 100% Federal.<br>2. Termination date - 6/30/66. |
| 1963 | | 1. Increased attention to the hard-core unemployed for training opportunities.<br>2. 25% training slots to youth. | 1. Included basic education and pre-vocational training with skill training.<br>2. Individual referrals on less-than-class size basis started.<br>3. Multi-occupational programs for disadvantaged youth and adults started. | 1. Youth lower age limit to 17 years.<br>2. Youth dropout-one year out of High School.<br>3. Added 20 weeks duration for basic education. | 1. Establishment of Manpower Advisory Committees.<br>2. State to assume one-third funding in Fiscal '65. |
| 1965 | 1. Refresher training in professional occupations.<br>2. "Reasonable expectancy" modified to include the concept of training to make individuals "more employable". | | 1. Expanded use of multi-occupational programs. | 1. Extend duration to 104 weeks.<br>2. Additional allowances for dependencies.<br>3. Permit daily commuting expenses.<br>4. Reduced period of gainful work to two years.<br>5. Permits allowances to other than head of family under certain conditions.<br>6. Liberalized Youth allowances eligibility. | 1. Start of labor mobility demonstration program.<br>2. Removed one-third State funding and required 10% State funding after 6/30/66.<br>3. Incorporated ARA training into MDTA<br>4. Termination date extended to 6/30/ |
| 1966 | 1. Experimental part-time training for employed.<br>2. Experimental programs for inmates of correctional institutions.<br>3. 35% of training slots for alleviating skill shortages.<br>4. Greater emphasis on OJT programs.<br>5. Increased attention to occupations in the health field. | 1. Special programs for older workers 45 and over.<br>2. 65% of training slots for the disadvantaged. | 1. Basic education need not be tied in with vocational training.<br>2. Continuation of multi-occupational programs.<br>3. Coupling of training programs with Anti-poverty programs. | 1. Reduced eligibility to one year of gainful work.<br>2. Elimates one year out of school provisions for Youth.<br>3. Permits a second course with allowances.<br>4. Provides for advance payment of allowances.<br>5. Incentive payments for relief recipients. | 1. Free physical exams for trainees where needed.<br>2. Extends labor mobility program.<br>3. Start of submitting annual State Manpower Plan. |

NOTE: Other changes in provisions and concepts which do not directly affect this study of manpower training are not shown in this chart.

## SECTION III - MDTA ACCOMPLISHMENTS AND PROGRESS (1962-1967)

In New York State, since the enactment of the MDTA, 551 institutional training projects have been funded and 48,721 trainees have been enrolled at a total estimat cost of over $108 million. The leading jobs among the 235 occupations for which training was provided are licensed practical nurse, typist, nurses aide/orderly, stenographer, production machine operator (machine operator general) and automobile mechanic.

MDTA training is reaching the hard-core unemployed (See Part V). About 85% of the enrollees were unemployed and 40% had less than three years of gainful employment prior to training. Over 50% of the trainees had not completed high school and 11% had less than nine years of school. Close to half of the trainees were non-white. Approximately 56% of those who completed training obtained training-related employment.

### Multi-Occupational Centers

A major achievement in training for the disadvantaged was the development of the "Umbrella" or "Multi-Occupational" training program. This program includes training in a variety of specific entry occupations plus an assortment of special remedial and preparatory services such as: basic training in communication and number skills; instruction in personal grooming and job discipline; exploration of vocational areas in training workshops and field trips; individual testing of aptitudes and interests in specific occupational skills. Since the first project was established in April 1964 for 1,000 disadvantaged Rochester youths, 30 more programs including recycled programs, have been approved in 8 upstate locations and New York City. Together they provide training for youth and adults in all of the State's major metropolitan areas. They represent 35% of all trainees approved in the MDTA institutional training program, and their estimated cost of $59 million accounts for 54% of all funds obligated in the program.

Coupled OJT

More recently there has been developed a type of program which "couples" the pre-vocational training part of multi-occupational programs with on-the-job training. This coupling of programs should significantly extend the training opportunities being developed for disadvantaged persons by opening additional desirable occupations to them. The State Labor Department's Division of Manpower is developing a series of coupled-OJT projects in the State this year. A typical program trains adults as machine operators. The Board of Education's Manpower Training Center provides 13 weeks of instruction in remedial and basic education, basic shop math, blueprint reading, use and care of precision measuring instruments, and technical terminology.

After the classroom instruction, the trainees are placed in jobs with employers who will conduct on-the-job training programs in their plants. On the job they will learn the operation of specific machines.

MDTA Expenditures - Fiscal 1967 and 1968

In allocating funds to the states for fiscal year 1967, Congressional actions decreased the total amounts available, and, within those amounts, decreased funds available for institutional programs while increasing funds available for on-the-job training. While not disputing the merits of on-the-job training as a direct lead to employment, the program shift has caused problems in full utilization of institutional facilities previously established.

Under a continuing resolution for allocating fiscal year 1968 funds to the States for MDTA activities, the New York State share has been apportioned as follows:

| | |
|---|---|
| Apportionment Factor | 11.41% |
| 1968 Apportionment | $29,666,000 |
| Allotted for Institutional Training | 20,310,000 |
| Allotted for OJT * | 9,356,000 |

* Includes $1.8 million for National OJT contracts administered directly from Washington D.C. by Federal BAT.

The following table illustrates the scope and estimated costs of these programs. Although the MDTA was passed and funded in 1962, training activity in New York State did not begin until early 1963.

TABLE 2 - TRAINING ACCOMPLISHMENTS AND COSTS UNDER MDTA

Institutional Projects

| Federal Fiscal Year: | 1963 | 1964 | 1965 | 1966 | 1967 | Cumulative |
|---|---|---|---|---|---|---|
| Projects approved | 125 | 142 | 195 | 229 | 125 | 816 |
| Projects funded | 64 | 115 | 149 | 130 | 93 | 551 |
| Trainees in funded projects | 4360 | 7335 | 14,823 | 16,823 | 13,492 | 56,833 |

* Developed by Division of Manpower for funding under MDTA. Does not include programs funded under State Manpower Training Act with State funds.

Referrals of Individuals on Less Than Class-Size Basis

Early in the experience of MDTA it became apparent that the time consuming but mandated procedure for the development, approval, funding and implementation of class-size institutional projects worked to the disadvantage not only of the trainee candidates who were generally unemployed and immediately available for the training, but, also, of the potential employers who were immediately in need of filling vacancies in shortage job skills. Furthermore, many occasions arose where the demand for an occupation was not of sufficient volume nor was the number of potentially qualified trainees available within a community sufficient to warrant the development of a proposal for training at a normal classroom size.

Thus, the individual method of referral to both public and private schools was devised as an alternate device for MDTA institutional-type training. Most such referrals have been made to private training facilities. However, built-in controls were established which required that these referrals be made only where:

1. No suitable MDTA course is available or contemplated within 45 days in the locality or in any other training center; or, if such course is or will be available, it is not practicable to include the interested trainee because the course has started or all training slots are filled.
2. Training is needed in an occupation for which there is not a sufficient demand to establish a local class-size course; or, the establishment of a regional or a State-wide class-size course is not feasible.

Another feature of individual referral to training under MDTA is that, after the Labor Department has recommended individual referral in the absence of an established available course, the Education Department determines where and when the individual will be given the opportunity for enrollment in a training course, and also determines the estimated costs of the training.

Advantages of this method of training are:

Selection by the trainee of the course and training site is possible where more than one course is available.

The private trade and business schools usually can accept students on a staggered basis, thus avoiding waiting time of the trainee to the date of enrollm

There is little build-up time needed by the private schools for acquisition of equipment, space and teachers.

The schools have specialized in certain occupations and have developed a working relationship with the employers who normally hire workers in these occupations, thus opening a wider scope for placement possibilities for the graduates.

The following table reveals the status of the "individual referral" program as of July 31, 1967:

TABLE 3 - INDIVIDUAL REFERRALS UNDER MDTA AND SMTA

Manpower Development & Training Act

| Federal Fiscal Year * (July 1 - June 30) | 1965 | 1966 | 1967 | Cumulative |
|---|---|---|---|---|
| Number of trainees enrolled | 50 | 374 | 298 | 722 |
| Net Estimated Costs (Education and Allowances) | $205,793 | $994,253 | $620,441 | $1,820,487 |

State Manpower Training Act

| State Fiscal Year * (April 1 - March 31) | 1967 | 1968 ** | Cumulative |
|---|---|---|---|
| Number of trainees enrolled | 225 | 112 | 337 |
| Net Estimated Costs (Education and Allowances) | $800,560 | $77,108 *** | $877,668 |

* Trainees are not necessarily enrolled in the same period in which project costs are obligated.

** First four months only.

*** It is estimated that $1 million will be obligated for the full State Fiscal Year.

## SECTION IV - STATE MANPOWER TRAINING ACT (ARTICLE 23A, NEW YORK STATE LABOR LAW)

Responsible officials in the State Administration and the State Legislature recognized early in the MDTA experience that many complicating and restrictive aspects of the Act prevented the proper exercise of programs to develop the skills needed by industry and the employability of the work force. To solve this problem the State enacted in 1966 Article 23A of the Labor Law, known as the State Manpower Training Act.

This article is designed to expand and improve the State's training programs by relating them more closely to the specific needs of local communities than was possible under the MDTA and by filling training gaps which were left by the complex operation of the Federal Act, particularly in the areas of inadequate funding and policy restrictions.

Close cooperation between the Labor Department's Division of Employment and Division of Manpower with respect to coordinating institutional and OJT training programs, and between the State Education Department and the Labor Department in program development, which operated under the Federal Act, has continued under the State program.

Criteria for course development, selection of trainees for referral, and job development and placement responsibilities of the New York State Employment Service are substantially the same under the State Manpower Training Act as under MDTA. Amounts and rules for payment of training, subsistence and transportation allowances under the MDTA have been generally followed under the State Manpower Training Act. The OJT phase of the State Manpower Training Act has been carried out in a manner quite similar to OJT under the MDTA.

Funds for SMTA for State Fiscal Year 1967 were allocated as follows:

| Purpose | Source | |
|---|---|---|
| | U.I. Penalty and Interest | General Fund |
| Individual Referrals | $ 1,000,000 | - |
| Medical Occupations | - | $ 1,000,000 |
| Metal Trades & Skill Shortages | | |
| Institutional | - | 500,000 |
| OJT | 500,000 | - |
| State Agencies Needs | 500,000 | - |
| | $ 2,000,000 | $ 1,500,000 |

The following tables detail the program activity under the State Manpower Training Act from January 1967 to September 1, 1967.

Tables 4 and 5 list the institutional training projects which have been approved and show their status, and summarize the individual referral program.

Tables 6, 7, and 8 summarize the 50 OJT contracts which have been negotiated between private employers and the Labor Department.

A cost-benefit evaluation of these State financed projects is not possible at this time due to the recentness of their approval.

## SECTION V - TRAINEE CHARACTERISTICS

The principal purpose of this section of the study is to indicate the characteristics of persons enrolled in the various MDTA training programs.

Tables 9 and 10 show the characteristics of virtually all the MDTA institutional enrollees from 1963, when reporting began, until May 30, 1967. Data for individual years show how the tempo of training enrollments was stepped up until it reached a peak in 1966. Cumulative figures from 1963 to 1967 give an idea of the type of trainee in the program during the entire period.

Among the major characteristics reported were: race, number of years of education, years of gainful employment, duration of unemployment, age, and sex.

The most significant points are:

Race - In the beginning of the program, white enrollees outnumbered negroes more than 2 to 1. In 1965, negro enrollees began to outnumber whites. For the entire 4½-year period, the number of negro and white enrollees was about equal.

Education - The educational level of the enrollees has dropped steadily since the start of the MDTA program due to the heavier enrollments of the disadvantaged. The largest group in succeeding years, and for the entire period had 9 to 11 years of schooling.

Age - Persons in the prime working ages of 22-44 constituted the largest group of trainees at the beginning. In later years, younger persons in the age groups 19-34 were the largest group among the trainees because of the policy of opening up more training opportunities to youth and the widening of eligibility for training allowances to youth.

Table 11 analyzes the labor force status of about 50% of the trainees completing courses between 1963 and January 30, 1967. Subsequent to training, it shows how many were unemployed, and how many were not in the labor force (broken down into four major reasons for not being in the labor force).

The employed, the unemployed, and those not in the labor force were further studied by such characteristics as: age, education, public assistance status and training occupation. The number of employed persons having a given amount of hourly earnings is also shown. There is, however, no comparison with prior earnings.

Tables 12 and 13 analyze the characteristics of the OJT enrollees in numbers, and per cent distribution, in the same manner as for the institutional trainees in tables 9 and 10.

The much smaller group of OJT trainees was predominantly male (4 out of 5 persons), and younger than the institutional trainees (over 50% under 22). White OJT trainees outnumbered non-whites by more than a 2 to 1 margin. Close to half of the OJT trainees were high school graduates. Two out of three were unemployed prior to entering OJT training.

TABLE 9

CHARACTERISTICS OF TRAINEES ENROLLED IN MDTA INSTITUTIONAL COURSES BY YEAR ENROLLED

## TABLE 14

Characteristics of Trainees Enrolled in MDTA Institutional Programs
United States and New York State, 1966

Table 14 compares the characteristics of institutional trainees in New York State and in the U.S. during 1966, the year when the MDTA program enrolled the largest number of trainees in any single year.

In New York State, the average trainee was younger than in the U.S. While N.Y. State trainees were divided about equally between whites and Negroes, 2 out of 3 trainees in the U.S. were white. The educational level of the U.S. trainee was higher than in New York State. Thus, N.Y. State's emphasis was directed more toward the disadvantaged youth and hard-core unemployed than is shown statistically for the nation.

a/ Per cent distribution based on reports for approximately 68,000 trainees.
NOTE: Details may not add to total due to rounding.
SOURCE: U.S. Department of Labor, Manpower Report of the President and Report on Manpower Requirements, Resources, Utilization and Training and OMPER, special tabulations.

TABLE 15

This is a per cent distribution of the trainees by occupational group in which the person is trained. The distribution is made for the U.S. and New York State separately to compare the differences in occupational emphasis of the two geographic entities.

In the U.S., the largest group of enrollees were trained in skilled, clerical, semiskilled, and service occupations, in that order. In New York State, the largest group was trained in clerical occupations. The next largest group were the skilled, with the semiskilled and semiprofessional group far behind these others, but rather significant in size.

TABLE 15

TYPE OF OCCUPATIONAL TRAINING GIVEN MDTA TRAINEES
UNITED STATES AND NEW YORK STATE
CUMULATIVE JUNE 1962-SEPTEMBER 30, 1966
(Per cent distribution)

| Occupational category in which trained | United States | New York State |
|---|---|---|
| Total | 374,190 | 29,359 |
| Per cent | 100.0 | 100.0 |
| Professional and managerial | 9.1 | 13.5 |
| Professional | 0.9 | 0.8 |
| Semiprofessional | 8.2 | 12.7 |
| Managerial | 0.1 | - |
| Clerical and sales | 21.4 | 28.1 |
| Clerical | 19.4 | 27.8 |
| Sales | 2.0 | 0.3 |
| Service | 12.5 | 11.7 |
| Agriculture | 3.4 | - |
| Skilled | 27.3 | 25.2 |
| Semiskilled | 17.6 | 13.1 |
| Other | 8.7 | 8.4 |

NOTE: Details may not add to total due to rounding.
SOURCE: U.S. Department of Labor, OMPER, special tabulation Table 52.

TABLE 16

This table shows the number of enrollees, by occupation in which enrolled, and by race. The largest group of non-whites, almost one-third, were enrolled in clerical and sales courses. The next largest group took training courses in the service occupations. The largest group of whites (a little more than one-fifth) were also enrolled in clerical and sales courses. The next largest group of whites were enrolled in skilled miscellaneous occupations.

It is significant to note from this table that the exisiting occupational level pattern for non-whites now existing in the business world is being broken up somewhat by more liberal non-white enrollments in the heretofore restricted professional, managerial, clerical and skilled categories.

## SECTION VI - COST-EFFECTIVENESS OF MDTA TRAINING PROGRAMS

This section of the report is concerned with a) the extent to which MDTA training programs are meeting their immediate training objective; b) the cost to Government, and c) the relative effectiveness of completed programs in terms of dollar cost per unit of accomplishment. The institutional programs analyzed were approved in fiscal years 1962 to 1965 and have been completed; the OJT programs analyzed were approved in fiscal years 1963 to 1967 and have been completed.

### Measures of Effectiveness

For each completed program, effectiveness is measured in terms of the number of persons who entered training, the number who successfully completed training, and the number who subsequently found employment either in a training-related job or in some other job. The per capita costs associated with these processes provide an indication of the relative cost to Government at each stage.

Costs per enrollee and costs per training completer are presented in the tabulations that follow. Cost per completer with a job have not been shown for institutional programs for two reasons; a) no information was available on the employment status of those who did not complete training, many of whom dropped out to take jobs, and b) the information on jobs held by completers did not relate to any one time period either in terms of elapsed time since the completion of the course or to any given date.

> Cost per enrollee is an indicator of the relative cost of establishing and conducting the training provided as well as the cost of getting individuals into the program and job referral services.
>
> Cost per trainee completer is a measure indicating the relative cost of providing the training estimated to be required to provide the skills needed for placement.

## Costs and Cost Differences

The cost to Government of each program includes only direct training costs, allowance costs, and overhead costs of State agencies participating in the program. It does not include indirect costs to Government or the costs to the individual trainee through loss of potential earned income.

As will be shown subsequently, costs of similar programs differ markedly. Factors affecting educational costs included instructional services, equipment purchase, building and equipment maintenance and repair, fixed charges such as space rental, as well as other costs such as custodial and utility expense. Operating factors that affected education cost included the duration of the training course, class size, the type of instruction provided and many other factors.

Allowance costs varied by the type of allowance for which the trainee was eligible, the authorized amount of allowance at the time, the proportion of trainees receiving allowances, and other related factors. These costs are associated largely with the characteristics of the individual trainee rather than those of the training program.

General overhead costs relate to all projects in a given fiscal year. They include project development costs and general overhead costs of the State and local Education Departments, the cost of services provided by the State Employment Service, and the State Division of Manpower. The cost of administration of Federal agencies is not included. Overhead costs are affected by a great many administrative factors including problems associated with developing and funding projects, and the proportion of individuals requiring the services provided by the Employment Service.

## Benefits and Program Effectiveness

Meeting skill needs and reducing unemployment are not the only benefits of MDTA training programs. As a result of training activities, numerous correlative benefits may accrue to the community such as; improvement of training facilities, development of an experienced corps of training specialists, and more stable community relations. The individual may enhance his personal skills and develop better social attitudes. These values and benefits are difficult, if not impossible to appraise objectively and quantitatively.

The measure of effectiveness used does not take into account the nature of the job held by the former trainee. If, as a result of special placement efforts, the job obtained for the trainee is one which could have been filled from the available supply of workers without additional training, then the social benefit is minimal. On the other hand, if the job held is one that could not be filled without the training effort and the trained worker vacates a job that can be filled from among the unemployed, then there is a double benefit to society, i.e., the incremental earnings of the trainee and the difference between no earnings for the previously unemployed worker and his present earnings. In short, in some cases it is possible that the training effort produced not one but two jobs. These possibilities are ignored in the computations herein presented.

It is also conceivable that through special counseling and placement efforts, individuals can be directed to jobs on the basis of the skills that they already have. This study does not examine the question of the relative desirability of expending public funds on special services or on training. The effectiveness measured by the denominator of the

cost-effectiveness ratio reflects the combined effect of all services and training provided as well as the efforts of the individual trainee.

## A. COST-EFFECTIVENESS OF MDTA INSTITUTIONAL TRAINING PROJECTS

### The Scope of the Survey

Included in this Cost-Effectiveness Section of the Survey are institutional projects approved from the beginning of the program through December 1965. Projects approved in 1966 and 1967 were not included because complete cost data were not available. A total of 310 projects that had 17,980 individuals enrolled for training are included. The sample includes all projects approved and funded in fiscal years 1962 and 1963; all but five projects approved and funded in fiscal year 1964; and all but eleven projects approved and funded in fiscal year 1965. Of the sixteen excluded projects, seven are multi-occupational projects for which complete cost data were not available. Other projects omitted included experimental and demonstration projects, individual referrals, projects financed in whole or in part by private agencies or directly by the Federal Government. Examples of such excluded projects are those assigned to such agencies as: Federation of the Handicapped, Mobilization for Youth, Institute for the Crippled and Disabled, New York City; Abilities, Inc., Long Island; and Crusade for Opportunity, Syracuse.

The cost of experimental and demonstration projects designed as tests of procedures or the feasibility of training were excluded because they are not typical. They provide experience whose cost is properly spread over the cost of all projects. In the case of other types of projects, financial data was not available on educational costs.

The following table is a summary, by Federal fiscal years, of the projects, trainees enrolled, and their post-training employment experience.

TABLE 17- INSTITUTIONAL PROJECTS INCLUDED IN THE SURVEY BY YEAR PROJECT APPROVED AND BY ENROLLEES, COMPLETERS, AND COMPLETERS WITH A JOB

| Year Project Approved | Number of Projects | Trainees Enrolled | Trainees Completing Course | Trainee Completers With a Job | Trainee Completers With a Training-Related Job * |
|---|---|---|---|---|---|
| Total | 310 | 17,980 | 13,053 | 9,437 | 7,659 |
| 1963 (a) | 64 | 3,923 | 2,865 | 1,896 | 1,517 |
| 1964 | 108 | 5,914 | 4,334 | 3,436 | 2,750 |
| 1965 | 138 | 8,143 | 5,854 | 4,105 | 3,392 |

a. Includes 1962
* See Note on Methodology

Table 18, on the following three pages, lists the relative effectiveness, as measured by the employment status of trainees completing training, of the various occupational training projects.

Overall, of the 17,980 individuals enrolled in training courses in the projects included in the study 73% or 13,053 completed training. Of these, 72% or 9,437 had a job at the time of the last report to the Division of Employment. Four of five trainees with a job had training-related employment.

## Duration of Training as a Cost Factor

The duration of training affects the cost of instruction as well as the period during which allowances are paid to eligible trainees. Tables 20 and 21 show cost variations by duration of training in weeks for seven occupations in which ten or more separate projects were approved. As might be expected, there was a close association between course duration and total cost per enrollee. Some irregularities appear. These can be attributed largely to differences in allowances paid.

TABLE 20 - AVERAGE INSTITUTIONAL PROJECT COST PER ENROLLEE BY DURATION OF TRAINING (IN WEEKS)
(SELECTED OCCUPATIONS)

| Occupations | No. of projects | Average project cost | Duration training: Less than 8 weeks | | 8 to 15 weeks | | 16 to 23 weeks | | 24 to 31 weeks | | 32 to 39 weeks | | 40 to 47 weeks | | 48 weeks or longer | |

## The Cost of Initial and Recycled Projects

Table 22 presents an analysis of 89 projects in five occupations for which training was most frequently provided. Thirty-nine projects were "original" projects and 50 were recycled projects, i.e., the training program was repeated one or more times at the same training facility. In only one occupation, machine operator, general was the overall cost per enrollee less for the recycled project than for the original project. There are two main reasons for this apparent anomaly. For four of the five occupations average training duration was substantially greater than when the training was first given, because the original training schedule was found to be inadequate. Average allowance costs, too, were larger in the recycled projects because of changes in the law permitting increased allowance schedules. Differences in the eligibility characteristics of the trainees contributed to the increased allowance costs. The longer period in which training allowances were paid, associated with increased course duration was also a factor. Educational costs were lower in virtually all recycled projects than in the original ones.

TABLE 22 - AVERAGE INSTITUTIONAL PROJECT COST AND DURATION OF TRAINING OF INITIAL AND RECYCLED PROJECTS (SELECTED OCCUPATIONS)

| Item | Auto mechanic | Auto body repair and maintenance | Licensed practical nurse | Machine operator general | Stenographer |
|---|---|---|---|---|---|
| Number of projects | 18 | 9 | 31 | 18 | 13 |
| Original | 8 | 4 | 13 | 9 | 5 |
| Recycle | 10 | 5 | 18 | 9 | 8 |
| Average duration of training (hours) | | | | | |
| Original | 892 | 923 | 1,478 | 478 | 744 |
| Recycle | 1,050 | 910 | 1,532 | 545 | 896 |
| Cost per enrollee | | | | | |
| Original | | | | | |
| Average project cost | $1,926 | $1,792 | $1,950 | $1,275 | $1,327 |
| Average cost per hour of training | $ 2.16 | $ 1.94 | $ 1.32 | $ 2.67 | $ 1.[illegible] |
| Recycle | | | | | |
| Average project cost | $2,390 | $2,646 | $2,209 | $1.269 | $1,426 |
| Average cost per hour of training | $ 2.27 | $ 2.91 | $ 1.44 | $ 2.33 | $ 1.59 |
| Cost per completer | | | | | |
| Original | | | | | |
| Average project cost | $3,081 | $2,344 | $2,630 | $2,106 | $2,021 |
| Average cost per hour of training | $ 3.45 | $ 2.54 | $ 1.78 | $ 4.40 | $ 2.72 |
| Recycle | | | | | |
| Average project cost | $3,342 | $3,381 | $3,013 | $1,861 | $2,121 |
| Average cost per hour of training | $ 3.18 | $ 3.71 | $ 1.97 | $ 3.41 | $ 2.37 |

Variations in Cost of Training by District

Training costs for the same occupation were higher in some areas of the State than in others. Tables 23 and 24 summarize cost differences for 265 projects in which training for an occupation was provided in more than one labor market district.

A total of 43 projects throughout the State trained workers to be a licensed practical nurse. Average cost per enrollee in these training projects was $2,144 including the cost of instruction, allowances and overhead. In the Binghamton district, the cost was $1,836 per enrollee compared with $2,561 in Albany. Average cost per enrollee for auto mechanic was $2,135 with a low in the Suburban district of $1,292 and a high in the Albany district of $2,677.

Cost differences arise from many factors including educational costs which, in addition to instructional and facility costs, are affected by course duration and also by allowance costs which depend on the characteristics of the trainees.

## B. COST-EFFECTIVENESS OF MDTA ON-THE-JOB TRAINING PROJECTS

### The scope of the survey

Included in this portion of the survey are all on-the-job training (OJT) projects (1) approved from the beginning of the program, 1963 through 1967, which have completed, and (2) developed by staff of the Division of Manpower. Projects which were negotiated by either the regional or national staff of the Federal Bureau of Apprenticeship and Training are not included because the necessary information was not made available.

### Employment-Effectiveness of Training

Tables 25 and 26 present data relative to the effectiveness of completed OJT projects on the basis of trainee retention and placement.

Overall, of the 3123 persons enrolled in the projects surveyed, 63.4% completed training. It is interesting to note that one, large, not too successful program, accounted for 737 of the total 1141 trainees who did not complete.

Table 25 shows, by fiscal year, the per cent of trainees enrolled who completed and the per cent of trainees completed who had jobs at the time when the training project had completed.

Table 26 shows the same information by type of project. The following is a brief explanation of the various types listed:

Job Entry - the objective of this type of project is to provide training opportunities to unemployed, unskilled persons so that they may acquire the skills necessary to obtain a job.

Upgrading - this type of project is intended to alleviate skill shortages by providing already employed persons with additional skills which in turn will improve the worker's position in terms of increased wages or job security.

Coupled - when the skill requirements for a given occupation require a substantial portion of theoretical knowledge or when the caliber of trainees is such that basic education is required, it is desirable to combine the on-the-job training with a period of classroom instruction. This type of project is termed "coupled". Responsibility for the development, operation, and administration of the classroom portion (supplemental instruction) is that of the State Education Department. Trainees who qualify are eligible to receive allowances during this portion of the training program.

Pre-apprenticeship - this term applies only to projects which provide training in occupations which are designated as "apprenticeable trades" by the State Apprenticeship Council. The objectives of this type of project are twofold (1) to encourage employers to conduct registered apprenticeship training programs, and (2) provide unemployed and underemployed persons with training in the elemental skills of a trade and thereby increase their chances for success in the apprenticeship program.

For Disadvantaged - this term applies to those projects which were developed especially for the training of disadvantaged persons. It should be pointed out that disadvantaged persons are also served in OJT projects which do not carry this special designation.

MDTA/OJT COMPLETED PROJECTS, (DEVELOPED BY DIVISION OF MANPOWER)

| TOTAL | 3123 | 1982 | 1825 | | |

* As reported upon completion of project

## Cost-Effectiveness of Training

Unlike institutional training, Government bears only a portion of the total training costs in OJT projects. In each case, a contract is negotiated with the OJT sponsor (usually an employer) by the Division of Manpower. This contract itemizes those training costs which will be reimbursed to the sponsor by the U.S. Government. Each contract is evaluated individually as to its "reasonableness" by the approval agency i.e., the Federal Bureau of Apprenticeship and Training.

Table 27 shows the number of trainees and per capita costs borne by the U.S. Government for OJT trainees enrolled, completed and employed, by Federal fiscal year. This table does not include State-funded OJT projects. Data for State-funded projects appear on page 16.

Table 28 shows the number of MDTA/OJT projects, trainees and per capita costs by occupational grouping.

## NOTES ON METHODOLOGY

### Institutional Training Program

The files of the State Department of Education and the Division of Employment containing the records of each project were made available through the cooperation of these agencies. From these records cost information was obtained as well as information on enrollees, completers and trainees with a job.

#### Costs

1. Education costs--Expenditures for each project were obtained so far as possible from the audited accounting records for each project (Form OE-4,000). For projects for which actual expenditure data were not available the cost of the projected as evidenced by the budget estimate or budget revision was used. The type of information used was identified in the tabulations. Budget estimates and budget revisions are probably somewhat higher than will be shown by the final audited figures.

2. Allowance costs--The Division of Employment made available a computer print-out showing actual expenditures for allowances paid to trainees on each project.

3. Overhead costs--Included in overhead costs were educational overhead consisting of two parts; one, planning and project development costs allocated to ten large metropolitan-rural areas, and two, the cost of State Department of Education administration for these projects. Educational administration costs were assigned proportionately to each project in the ratio that the number of enrollees in the project bore to total enrollment for the year in all projects. Project development costs for New York City were assigned in the ratio that enrollment in the individual project bore to the total number of enrollees for the year. The same procedure was used for the nine Upstate areas considered as a group.

Total administrative costs of the Division of Employment in connection with MDTA programs were assigned in the same manner as educational costs, i.e., on the basis of the ratio of enrollment in each project to total enrollment. It is known that there were wide variations in the amount of service rendered by the Employment Service by way of screening, guidance and testing, referral activities, etc. However, such activities as screening and testing do not necessarily relate to a referral to a particular MDTA project. For this

reason, the value of total time spent by Employment Service personnel in connection with MDTA projects was divided by the total enrollees in all projects and assigned to each individual project in proportion to enrollment in that project.

Overhead costs per trainee were derived by multiplying the computed overhead per enrollee by the ratio of completers to enrollees in New York City, in nine Upstate areas with project development funds, and in the rest of the State to obtain per capita average overhead costs. The sums so obtained were added to the cost of each project in the respective localities. It should be noted that this "averaging" method of assigning overhead costs per completer and per trainee with a job tends to show higher costs for successful projects and lower costs for unsuccessful projects than would be the case if the ratios of enrollees to completers were computed for each project separately.

Enrollee and Completer Job Data

1. Enrollees-- Enrollee data were obtained from the project files of the State Department of Education and from the reports of the Employment Service, which, in turn, received them from the local education authorities. Some differences appeared in the records as to the number of individuals enrolled in a course. This resulted, in part, from varying interpretations of the instructions by local educational authorities. For the most part it was possible to reconcile the differences, which in any event, were not large.

2. Completers--Because of deficiencies in reporting, the records of the Education Department and of the Division of Employment differed for some projects. The best available evidence was used, such as the duplicate certificates of completion, the last attendance record for the course submitted by the instructor, the statistical summary of attendance prepared by the instructor, the course termination reports (Form MT 102).

3. Completers with a job--The procedures in use provide for a follow-up to obtain the employment status of the trainee who completes the course of instruction three, six, and twelve months after completion. The trainee may have responded to all of these questionnaires, to some of them, or none of them. The information on employment used in this study relates to the last questionnaire that was answered. For the most part these are the ones sent one year after the completion of the course. The data were reported on Form MT 103 and were summarized by the Department of Health, Education and Welfare. Nonrespondents who completed the course are counted as being employed in the same ratio as those who responded. It is likely

that this method of including the nonrespondents tends to overstate the amount of employment. Completers with a training-related job were estimated on the same basis from the source documents used for estimating completers with a job.

## On the Job Training Projects

### Cost Data

The actual training costs reimbursed to OJT sponsors by the Federal Government were obtained from payment requests submitted by sponsors.

Education costs--Coupled projects only have costs incurred by the State Education Department. For these projects, the amounts of expenditures were obtained from audited accounting records for each project (Form OE-4000).

Allowance costs--Actual expenditures for allowances were obtained from the Division of Employment.

Overhead costs--Overhead costs for OJT projects were developed using the same base data and rationale as were used for institutional costs. Included in these costs were:

1. Division of Manpower Overhead -- Cost of promotion, development and servicing of OJT projects.
2. Education Overhead -- Cost of developing supplemental instruction, included in coupled projects only.
3. Division of Employment Overhead -- Cost for services in making allowance payments included in appropriate projects only. Costs of screening, testing, referral activities were applied in the same manner as for institutional projects.

### Trainee Data

Numbers of trainees enrolled, completed and employed were obtained from "OJT Progress and Compliance Report" Form OJT-4 submitted upon the completion of each project.

## SECTION VII - COSTS AND BENEFITS OF MANPOWER TRAINING

This section is the core of the Department's first comprehensive effort to evaluate manpower training in New York State. Selected representative projects, both institutional and OJT, have been studied in depth. The tables on the following pages, which are based on this in-depth analysis, should be examined carefully. They substantiate, for the first time, the belief that manpower training is followed by a gain in earnings, and suggests that government can recover the costs of manpower training programs in a relatively short period of time.

Table 29 shows that, on the average, the institutional trainees studied had increased annual earnings of $1,180, a gain of 84.8% during the year immediately following the completion of their training over earnings in the year prior to training. When compared to the average costs of training, that increase represents an average first year post-training earnings gain of 54¢ for every dollar which government invested in the training.

Table 30 shows that on the average, OJT trainees earned $1,378 more in the first year after training than in the year prior to training. Compared with the cost to government of OJT training, the increase represents an average first year earnings gain of $2.10 for every dollar invested by government in OJT training.

Comparisons between the relative costs and benefits of institutional training and OJT should be made cautiously. Institutional training and OJT are two distinctly different types of programs. They differ in such factors as:

1. Personal training characteristics of individuals enrolled;
2. Costs of providing training facilities, equipment, training materials, instructors, etc.;
3. Availability of immediate post-training employment.

Furthermore, certain types of occupational training can be conducted only in an institutional setting.

The methodology for the selection of the projects for this analysis and for obtaining the necessary cost and benefit data follows the tables.

b/ Actual total costs or earnings of all selected courses.

c/ Results from division of total actual costs or earnings by 191 trainees completed.

## NOTES ON METHODOLOGY

### Criteria for Selection of Projects for Study.

In planning this study it was obvious that time limits precluded a detailed study of all state-operated MDTA training programs. A representative number of projects, or sections of projects, both institutional and OJT, were selected for comprehensive, "in-depth" analysis to determine earnings gain by trainees in relation to the costs of the training. To assure that the selected projects were generally representative of MDTA training in all respects, the following criteria were used for selection:

1. Geographic - at least one project from each of the eight upstate employment service districts and four from New York City were included.
2. Occupational-a mix was achieved by spreading the projects over all of the more popularly-used occupations for training, representative of the skill needs of the state.
3. Trainee Population - a significant number of projects were selected which were designed to increase the employability of the disadvantaged segment of the work force. Also, care was taken to insure that such trainee characteristics as sex, age, educational level and ethnic composition were fairly represented in the projects studied.
4. Type of Training - a representative spread of institutional types of programs (regular, multi-occupational, individual referral on less than class-size basis) as well as OJT and OJT-coupled programs was used in the selection process. An effort was made to avoid projects which ran prior to the effective date of the MT 101-102-103 reporting procedure and which did not terminate less than 6 months prior to the study, in order to obtain valid data, but this was not possible in all cases.

The selected projects are representative of MDTA training program results to date.

Methodology of Obtaining and Computing Earnings Before and After Training

Arrangements were made by the New York State Labor Department with the Central Administrative Office of the Social Security Administration in Woodlawn, Md. to obtain annual earnings for 184 graduates of OJT programs, and 486 graduates of institutional programs in the 25 OJT and institutional projects selected for study. Earnings data were supplied for individuals in each training group, but the individuals were not identified by name in order to respect the Social Security Administration's standards of confidentiality regarding reports on the earnings of specified individuals.

Punch cards were supplied by the New York Agency to Social Security for each individual in the projects studied. These cards contain the full social security number, and the code identifying the training project which the individua had completed.

Data were returned by the Social Security Administration on computer punchouts showing on a separate slip for each individual annual earnings, year by year for the period from 1951 - 1967. Also shown each year were the four quarters of each year, and the quarter in which covered employment (where earnings were at least $50 a quarter) and non-covered employment occured. One limitation o the data was that in the period 1959 - 1965, earnings above the maximum taxable limitation of $4800 annually were not shown except when there were two or more employers in a year. In 1966, the same situation applied to the earnings of $6600 annually.

Work sheets were established for each section of the courses studied. The basis of comparison was earnings for the period one year before the training cours began, and one year after the course ended. Where it was not possible to work on calendar basis, estimates based on available Social Security data were made, worki backward and forward one year from the starting date, and one year from the ending date. Each individual's earnings were calculated on the one year before and one year after basis.

Where a training course ended in the latter part of 1966, or in 1967, and it was not possible to obtain any post-training earnings data from Social Security, a process of estimation was used. This was based on hourly earnings data obtained from the New York State Division of Employment Local Office records, or MT-101 (Characteristics of Trainees) and MT-103 (Post-Training) reports. For the most part, changes in hourly earning rates from the pre-training to the post-training period were applied to pre-training Social Security data. In cases where post-training hourly earnings data were not available (although pre-training Social Security data were), earnings figures were obtained directly from employers.

To arrive at probable annual earnings, where Social Security reached the $4800 and $6600 maximum, estimates were made based on the number of quarters in which the maximum was attained.

## SECTION VIII - FINDINGS OF OTHER COST-BENEFIT STUDIES

A number of ad hoc cost benefit studies have been made of MDTA training programs that vary substantially in data used, assumptions made, and in the questions considered. These studies tend to indicate that training programs pay off more than they cost. The results are summarized below:

1. The study of Connecticut experience 1/

Perhaps the most comprehensive and technically adequate study thusfar published was made by Michael E. Borus. This study of Connecticut MDTA experience compares a completor group with various control groups using multiple regression techniques to measure the benefits of the programs in terms of work experience for groups which did and did not utilize the training; these were compared with the total and average costs of the programs.

After allowing for differences in the age, sex, and other characteristics of completor and control groups, Dr. Borus estimates that the average completor earned $500 more in the year after completing training than he would have if he had not taken the training. This was mainly because of having steadier work than the controls did.

After taxes are subtracted from these additional earnings, and UI benefits not collected are also subtracted, the benefit from the training is projected for 10 years. However, this cumulative figure is reduced by a time-discount, and also to allow for some completors leaving the occupation from time to time since these individuals then derive no more benefit from the training. Because of the indeterminancy of these reductions, the author's estimates of 10-year benefits run from $535 to $1,030 per completor.

Cost of training to the individual is mainly the wages he forewent. If he might have earned $80 a week during the six weeks of the course, his cost

1. Borus, Michael E. The Economic Effectiveness of Retraining the Unemployed. Report to the Federal Reserve Bank of Boston. June 1964.

would be $166. This allows for tax on $80 per week earnings;for his receiving a training allowance; for his earning $8 a week in part-time employment. At the other extreme, for an unemployed person, the cost would be a minus $35 for the six weeks.

The author estimates the government gain in added taxes and reduced UI payments (10 years; discounted) to be between $5,500 and $7,800 per completor.

In terms of gains to the economy the author estimates that if the completor goes into a vacant job, he adds to the nation's production (directly and through secondary effects). The 10-year benefit discounted, is estimated to be between $21,000 and $30,000. The costs to the economy consist of governmental administrative and educational costs since training allowances are merely transfer payments.

It should be noted that this study does not compare earnings before the training period with earnings after the training period.

2. The West Virginia study 1/

This was a before-and-after training study of 501 trainees in West Virginia. Trainees were interviewed in 1962 soon after training ended and were followed-up a year later in 1963.

The study indicated that 71 percent of the completors were employed compared with 50 percent of those that had refused training or had not been accepted for training; and 60 percent for a probability sample of persons unemployed at the time the trainees were selected.

Using the persons who refused training as the chief control group, the study found that, of the completors, 60 percent gained in earnings, 17 percent had lower earnings, and 23 percent had no significant change. In the

1. Somers, Gerald G. Training the Unemployed in Becker, Joseph, ed. In Aid of the Unemployed, 1965, Chapter 11.

control group 35 percent had a gain in earnings.

The West Virginia costs were estimated to have been around $545 per capita. They are so low in part because the training allowance was only $23 a week for the programs under Area Redevelopment and zero for state programs.

In general this study indicated post-training earnings higher than pre-training, a low average payback time, and an expected capital value increase.

3. The Nationwide Study 1/

This was a benefit (not cost) study of MDTA trainees from 1965 through the summer of 1964. The sample came from 49 states and included:

| | |
|---|---|
| 784 | completors |
| 413 | dropouts |
| 925 | controls |
| 136 | eligible but failed to enroll |
| 2,258 | |

The record of completors was compared with that of the control group (usually neighbors and friends of trainees selected to resemble the trainees as closely as possible). For those with full-time jobs there was little difference in weekly earnings between completors and the control group. Family income of completors including those with part-time jobs was higher than for the control group, perhaps because of steadier work.

Fifty-two percent of the completors and 48 percent of the dropouts had been employed more than 80 percent of the time since training compared to 20 percent of the controls. But the difference may well be overstated,

1. Main, Earl D. A Nationwide Evaluation of M. D. T. A. Institutional Job Training Programs. National Opinion Research Center Report, No. 118, Sept.-Oct. 1966.

because, for the controls, the figures include periods during which their opposite numbers were undergoing training; and all controls were unemployed at the time training began.

The record of completors was also compared with that of dropouts. Dropouts had higher pay rates than completors at the time of the interview. According to the author, 35 percent of the dropouts left to take jobs, a fact that explains this difference.

4. The Massachusetts Study 1/

This was a cost-benefit study of MDTA-type institutional training courses given in Massachusetts between 1958 and 1961 (pre MDTA). A total of 907 trainees of whom 618 were men and 289 were women were studied. The inquiry compared (1) the experience of the 438 completors who found training-related jobs with (2) that of 104 controls (a random sample of UI claimants who had six characteristics corresponding to those of the trainees). Trainees were interviewed; a mail questionnaire was sent to the controls.

Aggregate annual total income of completors was 35 percent higher after the training period than before. The control's income rose only 11 percent. Most of the completor's gain is therefore attributed to the training. Completors had less unemployment after the training than did the controls.

Assuming that the training benefits would accrue over the working lifetime of the completors (average age 30) and applying a 10 percent discount but not allowing for deaths and skill obsolescence the author estimated that the cumulated benefit for the 438 completors would be $3,900,000.

Costs of providing the training are estimated on the basis of education costs and subsistence costs. Overhead cost and capital are not counted. On this basis the total cost is estimated to be $633,000 for the 907

1. Page, David A. Retraining Under the Manpower Development Act: A Cost-Benefit Analysis, Brookings Institution, 1964.

trainees. This leaves an aggregate net benefit of approximately $3,300,000.

It should be noted that no attempt is made to estimate cost to the individual (such as wages foregone during the training period) nor to subtract additional income tax from his additional earnings. These would tend to reduce the aggregate benefit.

5. A Job Corps Cost/Benefit Study 1/

Since mid-1966, the Job Corps has been conducting a continuing internal study of the costs and benefits of Job Corps training. The final results are unpublished.

The net costs of the average Job Corps experience for a youth, based upon a five-month stay, is estimated to be about $3,510. The net cost estimate for a 12-month stay is estimated to be $7,492. These cost estimates include earnings foregone by the Corpsmen, but exclude allowance payments to Corpsmen and their parents.

The effect of the Job Corps on increasing the earnings of the Corpsmen above what the earnings would have been in the absence of the program was the sole measure of benefits used. No allowance was made for any benefits that stemmed from general improvements, civic behavior, lower crime rates, more stable family relationships, or other such hard-to-measure consequences of a youth's experience in the Job Corps.

Two alternative measures of earnings improvement were used. One was based on the educational gains achieved in Job Corps in conjunction with the relations between education and lifetime earnings that have been estimated in the statistical studies available. Using conservative discount rates to translate expected future earnings to present values, the estimated present value of the improvement in lifetime earnings for the average Corpsmen

1. Cain, Glen G., Benefit/Cost Estimates for Job Corps Based on Educational Gains Data and Wage Data from the Harris Study (unpublished).

(who was in the program about five months) was determined to be between $3,700 and $5,900.

The second measure of earnings improvement was based upon a direct comparison of the wages that were currently being earned by ex-Corpsmen with the wages of a comparable group of youth who had had no Job Corps experience. The present value of that lifetime earnings differential (in favor of Job Corps) was estimated to be about $5,100. Both the educational data method and the wage data method are alternative ways of measuring the same thing -- the gain in expected lifetime earnings. According to the study, "..... the most realistic benefit/cost ratios computed in this study are at least .97, and are more likely to be around 1.18, .....".

*DISTRIBUTIVE EDUCATION; *PROGRAM GUIDES; *PROGRAM DEVELOPMENT; *COOPERATIVE EDUCATION
FLORIDA

Administrators, supervisors, and teacher-coordinators may use this guide in establishing and operating programs in cooperative distributive education in the State's high schools. The guide was developed by distributive education teacher-coordinators under the supervision of a curriculum specialist for distributive education at the state level. Major divisions are (1) philosophy and objectives which discusses marketing in the American economy, the characteristics of the cooperative plan, and the levels of training, (2) the cooperative distributive education teacher-coordinator which lists teacher-coordinator roles and functions, and professional organizations, (3) program organization and operation which discusses surveys, advisory committees, student selection and counseling, training plans, sponsor development program, and facilities, (4) curriculum planning which includes competencies, teaching plans and methods, and distributive education club organization and program, and (5) program promotion and evaluation which provides specific evaluation checklists. A list of references follows each division. Forms to be used in program operation, such as a community survey, a student interest questionnaire, a sample training plan, suggested teacher techniques, and a promotional calendar are included. ## FOREWORD

Distributive Education had its inception in 1936 with the passage of the George-Deen Act. This Act provided funds to be made available to states for the launching of a nationwide program designed to provide training for people engaged in or planning to become employed in distributive occupations.

Because of its success, subsequent legislation has expanded the Distributive Education Program and its offerings to include more people. Through the initial efforts of the federal government, cooperation of state governments, and the aggressive activity in many local communities, Distributive Education is now established as an integral part of the total education program.

This publication has been prepared to assist administrators, supervisors, and teacher-coordinators in successfully establishing and operating programs in Cooperative Distributive Education in Florida high schools. It is hoped that this guide will be helpful in the development of programs which will prepare high school students for future careers in marketing and distribution through utilization and implementation of the cooperative plan as a method of instruction.

This guide was developed under the supervision of Miss Gail Trapnell, Curriculum Specialist for Distributive Education, State Department of Education.

## ACKNOWLEDGEMENTS

Appreciation is expressed to Mrs. Dianne Brewington, former teacher-educator of Distributive Education at Richmond Professional Institute, Richmond, Virginia, who served as chief consultant in the revision of this guide. The efforts and contributions of the following Distributive Education teacher-coordinators are also appreciated:

## PHILOSOPHY AND OBJECTIVES

### Marketing In The American Economy

Production, exchange, distribution, and consumption form the four major processes in the American economy. Within these economic processes, four kinds of utilities must be created: form, time, place, and possession utility. Marketing serves to create three of these utilities: namely, time, place and possession. Marketing ties production, exchange, distribution, and consumption together through a continuous process of determining consumer need and demand for a product or service, and directing the flow of those products and services from the producer to the consumer.

Until the turn of the twentieth century, over three-fourths of our labor force were employed in agriculture, the extractive industries, construction, and manufacturing, with less than one-fourth employed in all other industries. This employment pattern reflected a basically agrarian economy. The movement of goods from producer to consumer was relatively simple, and the limited variety of goods required modest effort by the distributive segment of the economy.

With the advent of the Industrial Revolution and the introduction of mass production in this country, the distributive segment grew in importance and complexity. Today, distribution and marketing represents the largest single segment of our economy as more than fifty per cent of the labor force are employed in the broad field of marketing and distribution.

The marketing component in retail prices today represents over fifty per cent of the price and an equivalent amount in value added. There is every indication that this trend will continue as our capacity to produce has far exceeded our capacity to distribute. The importance of distribution and marketing in our economy is further emphasized in that each of America's more than four million business firms has a product or service to sell. The security of the investment, stability of employment, and profitability and success of each business is dependent upon the effectiveness of the marketing process.

## Distributive Education

Distributive Education is a program of vocational instruction in the field of marketing and distribution. It is designed to prepare individuals to enter, to progress, or to improve competencies in distributive occupations. Emphasis is placed on the development of attitudes, skills, and understandings related to marketing, merchandising, and management.

Distributive Education is a cooperative effort whose participants are educators, students, and businessmen in the field of distribution. Improved skills and understanding enhance the value of the Distributive Education trained employee and subsequently enlarge his scope of endeavor in the field of distribution. This increased efficiency and enlightenment through education results in mutual benefit to employee and employer as well as reflecting professional dignity and status to the profession of marketing.

Distributive occupations are those followed by proprietors, managers, or employees engaged primarily in marketing or merchandising goods or services. These occupations are found in such businesses as retail and wholesale trade;

finance, insurance and real estate; marketing services; manufacturing; transportation, storage, utilities, and communications.

## Distributive Education as a Part of Vocational Education

Emphasis should be placed on the fact that Distributive Education is a part of vocational education, which is that phase of education designed to improve the proficiency of an individual in a specific occupation or occupational cluster. Education is vocational:

... When it is taught and learned in its relationship and application to the actual job requirements of a specific occupation or occupational cluster.

... When it is of more value to persons who will pursue, or are pursuing, a specific occupation than to other persons.

... When it is timed so that the learner can apply it at the time it is learned to useful and productive work in a specific occupation.

... When the necessary skills and knowledge of a particular occupation are being taught and learned in their practical and proper application to the work.[1]

## Objectives of Distributive Education

The objectives of the Distributive Education Program are:

1. To develop an understanding of the social and economic responsibilities which accompany the right to engage in distribution in a free competitive society.
2. To provide continuous assistance in securing the knowledge, skills, and attitudes needed in making adequate choices, plans and interpretations essential to satisfactory adjustment in the distributive occupations.

3. To strengthen the employment competencies of the student, thereby increasing the efficiency of marketing techniques and practices.
4. To prepare distributive employees to satisfy the needs of consumers intelligently, efficiently and pleasantly.
5. To create an awareness of social, economic, and educational developments affecting changes in marketing practices.

## Students to be Served

Students to be served by the Cooperative Distributive Education Program are:

1. Students seeking to enter a distributive occupation while still enrolled in high school and who meet standards of employability.
2. College-bound students who seek experience in their chosen field of distribution or who plan a future as a Distributive Education teacher-coordinator.
3. Project Distributive Education students who have completed one year of PDE and who desire to continue in Distributive Education through the cooperative plan.

## The Cooperative Plan Defined

The Cooperative plan for Distributive Education is a method of instruction which involves regularly scheduled part-time employment and classroom instruction. The part-time employment provides opportunities for the student to experience theory in practice while further developing those competencies required for distributive employment. Classroom instruction is centered around the discipline of marketing and instruction related to the student's distri-

butive career objective. Cooperative Distributive Education implies by its name, the involvement of several distinct groups of people. The following list indicates many of the benefits which may be derived by these groups through their involvement with the program:

Students have the opportunity to prepare for a future career in distribution while earning high school credit. They learn principles of distributive businesses as well as desirable work habits. They develop an understanding of our social and economic free-enterprise system.

School Administrators broaden their educational offerings to meet the needs of more students. They benefit by sending career-minded "ambassadors" into the field of marketing and distribution to demonstrate the quality of instruction received within the school curriculum. Public relations are improved through the promotion of cooperation between the school and the business communities.

Distributive Businesses benefit by receiving better trained personnel which reduces turnover and increases efficiency on the job. It provides the opportunity to train, with the aid of the Distributive Education teacher-coordinator, the students in their on-the-job training.

Parents benefit in having their child provided the opportunity to prepare for a specific career while completing his regular academic program of instruction.

Consumers benefit from intelligent and helpful services from distributive employees plus the ultimate savings found through reduction in opera-

tional costs to the distributive businesses.

## Characteristics of the Cooperative Plan

*THE INITIATION OF A COOPERATIVE PROGRAM IN DISTRIBUTIVE EDUCATION IS BASED UPON THE FINDINGS OF SURVEYS OF EMPLOYMENT OPPORTUNITIES IN MARKETING AND MERCHANDISING IN THE AREA SERVED BY THE SCHOOL.*

To obtain an overall picture of employment needs and trends in the area served by the school, data can be collected from local business census figures. After the general needs of a community have been determined, local surveys are made to ascertain more specific training needs and employment opportunities in the community. The survey must be kept current with up-to-date information.

*AN ADVISORY OR PLANNING COMMITTEE, INCLUDING REPRESENTATIVES OF BOTH THE SCHOOL AND THE COMMUNITY, ASSISTS IN PLANNING AND DEVELOPING THE PROGRAM.*

The advisory committee assumes a leadership role in supporting and developing the Cooperative Distributive Education Program. This committee meets whenever a need arises to assist in identifying attitudes, knowledges, skills, and understanding needed by students for success. The school can more effectively plan a Cooperative Distributive Education Program with the assistance of an advisory committee.

*PROVISION IS MADE FOR SCHOOL APPROVAL OF ON-THE-JOB TRAINING ACTIVITIES*

The teacher-coordinator consults with the training sponsor to reach agreement on responsibilities and training experiences to be involved in the student's part-time job. He then relates job experiences to classroom instruction and assists the training sponsor in identifying the opportunities for the student to apply on the job the principles and practices developed in the

curriculum. This frequently involves using a cooperative training agreement in which desired learning experiences on the job are scheduled according to a progression of complexity and in relation to units of instruction presented in the classroom. School approval of the student's training program is an essential feature of cooperative training.[2]

*CREDIT RECOGNITION FOR PROFICIENCY IN ON-THE-JOB ASSIGNMENTS*

Upon satisfactory completion of the classroom work and the on-the-job training, students should receive one unit of credit for each hour of classroom instruction in distributive education and one unit of credit for the occupational training. Proficiency developed during regularly scheduled part-time employment is evaluated through progress reports on the students' job performance obtained by the teacher-coordinator in consultation with training sponsors.

*REGULARLY-SCHEDULED EMPLOYMENT*

Employment that is a regularly scheduled part of the instructional plan is of utmost importance in using the cooperative method. Regularly scheduled employment provides the laboratory, it creates and maintains motivation, and it permits involvement and measurement of achievement. Traditionally, scheduled employment averages not less than fifteen hours per week throughout the school year with a major portion of this time during the normal day school hours. It has been felt that approximately 500 hours of coordinated training in a distributive business is needed to develop practices and judgement skills to a satisfactory level.[3]

*ALL STATE AND FEDERAL LAWS PERTAINING TO EMPLOYMENT PRACTICES ARE COMPLIED WITH, INCLUDING THOSE RELATING TO STUDENT-LEARNERS.*

In Florida, regardless of whether or not a minor (16-18 years of age) goes to school, he must secure an age certificate for his employer. Minimum age is 16 for general employment, 18 for all occupations which may be determined hazardous. It is the employer's responsibility to know about the status of student-learners, but teacher-coordinators must be aware of the state and federal wage and hour laws. Since the passage of the federal minimum wage and hour laws, an exemption certificate for less than minimum wages has been made available for student-learners. This certificate must be completed by the employer and the teacher-coordinator and filed with the Regional Director, U. S. Department of Labor, Wage and Hour Division. It is recommended that a student-learner not be allowed to exceed a combined total of forty-five (45) hours per week in school and on the job.

*STUDENTS ARE ENROLLED ON A BASIS OF INTEREST, ABILITY, AND NEED AND AS A RESULT OF ACCEPTED GUIDANCE PROCEDURES.*

Students are screened by the principal, guidance counselor, and teacher-coordinator. Past records, test results, faculty rating reports, and character references are used to determine the extent to which the student can profit from the program. Personal counseling with parents and student should be done to enable the student to select a career objective in distribution in keeping with his interests and abilities.

*EACH STUDENT IDENTIFIES AN AREA OF OCCUPATIONAL INTEREST OR CAREER OBJECTIVE OF WHICH HIS PRESENT PROGRAM IS AN INTEGRAL PART.*

Each student identifies an area of occupational interest in the field of

distribution, which becomes the focal point of individualized instruction and on-the-job training. The student is employed in a distributive occupation that is in keeping with his career objective and permits him to progress toward that goal. Through participation in the program, certain students may awaken to opportunities not before seen or considered and may change their original objectives. Career development is a goal of Distributive Education. Full advantage of the past experience and knowledge of the teaching faculty, guidance personnel and community leaders are used in assisting students to identify an occupational interest or goal.

*PROVISION IS MADE FOR DISTRIBUTIVE EDUCATION STUDENTS TO PARTICIPATE IN THE STUDENT ACTIVITY PROGRAM, INCLUDING CLUBS ORGANIZED TO APPEAL TO STUDENTS INTERESTED IN DISTRIBUTION.*

Students participate in local, state, and national activities of a youth program designed for Distributive Education students--Distributive Education Clubs of America (DECA). DECA is discussed more fully in a subsequent section. Students also participate in other phases of the student-activity program along with other members of the student body. This participation would include such activities as student government, assembly programs, and other special interest clubs that the school and student's schedule will permit.

Levels of Training In Distributive Education

Distributive Education in the State of Florida is available on four levels of instruction and is designed to provide stepping stones for advancement in the field of distribution and marketing. Each student is encouraged to continue his education, based on his abilities, needs and desires, through these instructional levels.

PROJECT PLAN FOR DISTRIBUTIVE EDUCATION, offered on the high school level, involves a regularly scheduled series of individually designed learning activities that give students an opportunity to apply theory in practice while developing competencies through projects related to their distributive occupational objectives. The project plan extends classroom instruction into a laboratory environment. (Refer to Bulletin 74H-6, The State Department of Education, The Project Plan for Distributive Education in Florida High Schools.)

COOPERATIVE PLAN FOR DISTRIBUTIVE EDUCATION, offered on the high school level, combines the classroom instruction in marketing with occupational experience in distributive businesses. Students make application of principles learned in the classroom to their actual job.

DISTRIBUTIVE EDUCATION IN THE JUNIOR COLLEGES is designed to develop the occupational competencies required for the acquisition of and advancement in junior executive positions within the field of marketing and distribution. (Refer to Bulletin 74H-7, The State Department of Education, Distributive Education Programs in Florida's Junior Colleges.)

DISTRIBUTIVE EDUCATION IN SENIOR COLLEGES AND UNIVERSITIES provides the opportunity to prepare for teaching careers in distributive education by earning the bachelor's and master's degrees in distributive education.

ADULT DISTRIBUTIVE EDUCATION provides training for those who are already employed or who are preparing to enter a distributive occupation who wish to upgrade or update their occupational skills and knowledge to achieve employment stability or advancement. While no formal credit is given, the adult program provides education to the entry, supervisory and managerial levels of businesses in the marketing and distribution occupations. These programs should result in immediate increase of job proficiency, eventual promotion, and better understanding of the field of economic activity in which the employees are engaged. (Refer to Bulletin 74H-5, The State Department of Education, Organization and Operation of Distributive Education Programs for Adults.)

## THE COOPERATIVE DISTRIBUTIVE EDUCATION TEACHER-COORDINATOR

The Cooperative Distributive Education teacher-coordinator is a regular member of the school staff who is responsible for the operation and administration of the CDE Program in the local school. The title, teacher-coordinator, designates the combining of classroom teaching, supervision of on-the-job training, and coordination of the two experiences for each student. The teacher-coordinator is a certified teacher who, through education and experience, has gained the special skills and knowledge necessary to counsel students towards the development and realization of a career objective in distribution.

### Role and Function of the Teacher-Coordinator

The role of the teacher-coordinator is an expansive one. Primarily the responsiblities fall into the following areas:

To the Distributive Education Student the teacher-coordinator is responsible for proper counseling, adequate supervision of the on-the-job training, assistance in the selection, adjustment and advancement of the student toward their chosen career objective and providing a vocationally oriented curriculum in the field of distribution and marketing.

To the School Administrator the teacher-coordinator is responsible for interpreting and supporting administrative policies, keeping the administration informed as to activities and functions of Distributive Education, maintaining the proper relationships with the business community, and utilizing time, materials and supplies in the proper manner.

To the Business Community the teacher-coordinator is responsible for explaining the objectives of the program, selecting students who can contribute to the business world through the discipline of marketing taught in the classroom, keeping up-to-date on changes in marketing practices which will enable him to continue his contribution to the business community.

To Himself the teacher-coordinator is responsible for setting an example for students, cooperating with school faculty, parents and businessmen, and maintaining a professional attitude at all times.

To the total Distributive Education Program the teacher-coordinator is responsible for maintaining a balanced program of offerings including Project and Cooperative Distributive Education on the high school level as well as cooperating on the adult education level to see that training within the field of distribution is available where needed in the community. The teacher-coordinator encourages qualified students to continue their education through the junior college Mid-Management Programs, the Adult Distributive Education offerings, and/or through college offerings in Distributive Education.

The total job of the Distributive Education teacher-coordinator may be refined into five basic functions of the position. They include: (1) teaching, (2) coordination, (3) counseling, (4) public relations, and (5) operation and administration. These functions are outlined on the following page.

## DISTRIBUTIVE EDUCATION TEACHER-COORDINATOR FUNCTIONS

| TEACHING | COUNSELING | COORDINATION ACTIVITIES | OPERATION AND ADMINISTRATION | PUBLIC RELATIONS |
|---|---|---|---|---|
| Prepares and revises teaching material | Explains DE Program to students, parents, and school officials | Selects appropriate training agencies | Plans a total program of work | Explains DE to business, civic and school groups |
| Teaches DE high school students | Selects students for DE programs | Prepares training plan for each student | Arranges for adequate classroom facilities | Participates in local community functions |
| Evaluates the results of teaching | Places DE students in appropriate distributive training agencies | Coordinates classroom activities with on-the-job work experience | Makes community surveys | Plans and prepare publicity |
| Maintains content resource file | Counsels with high school students | Evaluates students progress on-the-job with employer | Organizes and supervises DECA Chapter Program | Takes part in extra-curriculum and accepts school duties |
| Maintains merchandise information files | Acts as training consultant to distributive businesses | Makes on-the-job coordination and home visits | Supervises interns from Florida colleges | Keeps in direct contact with school principal, superintendent, parents and busin community |
| Provides vocational application in the classroom | Follows up on student progress | Gives necessary information and training to the job supervisors of the students | Works with advisory committee | Arranges and dire special events related to the DE program |
| Keeps abreast of innovations and new ideas in distribution | Cooperates with school guidance counselors | Encourages articulation between various levels of the DE program | Prepares necessary reports | Assists in the pr motion of the tot DE program |
| Uses DECA as a method of teaching | Provides information on career and educational opportunities | | Conducts practical research | |
| Varies methods of presentation according to needs of students | | | Maintains built-in evaluation of total program | |

The Distributive Education teacher-coordinator, unlike many other academic subject matter teachers, is usually the only person trained in the field of distribution within the boundary of the school. It can be said that a Distributive Education Program is no stronger than the teacher-coordinator in charge of that program. The personal attributes necessary to qualify are:

... The ability to work successfully with people.

... A thorough educational preparation for teaching in this field.

... The ability to participate in school, civic and educational organizations.

... A belief and understanding of the philosophy of vocational education.

... The potential for leadership and the ability and willingness to follow.

... The ability to gain the confidence of the business and school people.

... The ability to provide group and individual instruction to students.

... A willingness to adjust to change.

... The ability to maintain good business procedures at all times and to counsel students in the same.

An individual who holds a bachelor's or master's degree from a standard institution of higher learning may receive a certificate covering teacher-coordinator of Distributive Education when he meets the requirements as outlined in the Bulletin, Florida Requirements For Teacher Certification.

## Professional Organizations

Distributive Education recognizes the importance of professional leadership to the success of the program. The professional growth of an individual necessitates a knowledge of self, others, and his job. To enable the Distributive Education teacher-coordinator to keep abreast of his own teaching field as well as the developments within the field of distribution, professional organizations

are available at the national, state, and local levels for his participation.

*NATIONAL:* American Vocational Association -- The AVA composed of vocational educators across the nation with national headquarters located in Washington, D.C., provides the opportunity to share ideas, actions, and plans through its national publication, AVA Journal, as well as constant surveillance of national legislation affecting vocational education. This is the one organization through which all vocational educators have the opportunity of coming together to combine their efforts for the continual growth and improvement of vocational education in our nation.

National Association of Distributive Education Teachers -- NADET is composed of Distributive Education teacher-coordinators from the fifty states. The national headquarters in Washington, D.C. as well as the officers provide the individual teacher-coordinator member with publications, projects, promotional aides and suggested techniques which are directly applicable to Distributive Education.

*STATE:* Florida Vocational Association -- FVA is affiliated with the AVA and serves to carry out the functions of the parent organization while interpreting changes affecting vocational education in the State of Florida.

Florida Association of Distributive Education Teachers -- FADET is an affiliate of the Florida Vocational Association and the National Association of Distributive Education Teachers. Its major purpose is to assume and maintain state and local leadership in the promotion, advancement, and improvement of the standards of Distributive Education as a program of public education. Active membership is extended to all Distributive Education personnel including teachers, coordinators, and supervisors at all levels of instruction.

*LOCAL:* Each local school district has professional organizations through which a wider understanding of local situations may be obtained. It is recommended that each Distributive Education teacher-coordinator belong to these organizations and attend work conferences and meetings in their locale.

Membership in professional associations is encouraged. Other associations that will prove helpful to the teacher-coordinator are the National Education Association, the Florida Education Association, the Classroom Teachers Association, The American Marketing Association, and the Sales and Marketing Executives.

## Professional Growth and Advancement

Membership in the professional organizations is only one step toward true professional growth. Active participation is required of every member to assure the expansion of the Distributive Education Program to meet the needs of the society of tomorrow.

A professional person may be characterized as one who:

... Maintains an open mind.

... Recognizes the limitations of his own experiences.

... Maintains an enthusiasm for his job.

... Provides for renewal and extension of his knowledges, skills, and understandings.

... Broadens his understanding and compassion for the problems of youth.[2]

The expanding role of distribution within our economy provides a continued need for increased enrollment in Distributive Education. The growth of the Distributive Education Program is impeded primarily by the lack of qualified personnel in the field. Every Distributive Education teacher-coordinator has a professional and personal interest in this expansion. Professionally the teacher-coordinator should be constantly concerned with the recruitment of prospective teacher-coordinators; personally, each coordinator should seek to advance within the field. Opportunity and need for Distributive Education personnel as supervisors, adult instructors, teacher-educators, and junior college instructors is ever present. The State Department of Education in Florida seeks to promote personnel from within the framework of employed distributive educators in the school systems of Florida wherever possible.

## ORGANIZATION AND OPERATION

### Establishment of Goals

Any program of action is more successful when it is carefully planned in detail before being implemented. The first step is the establishment of the major goals to be accomplished during the school year. Some examples of goals might be:

1. To develop a program that meets the needs of the students in the local school and community.
2. To familiarize the parents and the community with the operations and benefits of the Cooperative Distributive Education Program.
3. To enhance the working relationship between the school and the business community in order to provide training in distribution to the fullest extent.

These goals will vary depending upon the type of program, length of time the program has been in existence, and the experiences of the teacher-coordinat

Once the goals of the program are developed, a program of work should be planned in three areas: (1) a teaching calendar for the year in each class, (2) an activities calendar in cooperation with the junior college Mid-Management Program and the Adult Distributive Education Programs in the community, and (3) a calendar of events for the local chapter of the Distributive Education Clubs of America.

A Cooperative Distributive Education Program comes into existence as a result of an expressed need. Various reasons for the establishment of a program include:

1. To meet the needs of the total school student body.
2. A constant need for trained distributive employees by businessmen in the community.
3. A desire on the part of high school students to be better prepared and to possess more marketable skills upon graduation.
4. To upgrade and keep current the vocational education programs to meet the business needs of the community.

Surveys

Three types of surveys are to be used in the development of a Cooperative Distributive Education Program in a given community: (See Appendix for examples)

1. Survey of Distributive Job Opportunities (Community Survey)
2. Survey for New Program
3. Survey of Student Interest in Distributive Education

A community survey should become the foundation for the program of work for the year. It can provide the teacher-coordinator with vital information on types of businesses, amount of training being conducted, and number of prospective placements for cooperative students. If properly conducted, the community survey can also serve to introduce the teacher-coordinator to the community and familiarize the businesses with the Distributive Education Program.

Certain procedures should be followed to insure success:

1. Approval for the survey should be obtained from the superintendent of schools and the principal as to purpose, form, and method to be used in the survey.
2. Release of newspaper articles explaining the purpose and details of

the survey, prior to the actual time to start.

3. Contact the local merchants association to explain the purpose of the survey and, if possible, obtain a list of the local businesses. If no list is available, information may be found in the city directory, through the Chamber of Commerce, or the Florida State Employment Service.
4. Schedule interviews with businessmen over a period of time. Do not try to cover the entire community in the first week.
5. Tabulate the results in a manner that will keep the information in compact form.
6. File the information, and on an annual basis, bring it up to date through follow-up revision, and by adding new businesses as they come into the community.

The purpose of the survey for a new program is to determine the potential development for a Cooperative Distributive Education Program in the community and to state the preparations and plans regarding the program for the school board. Submitted through the county school superintendent's office to the State Department of Education, information is given regarding area employment data, interest on the part of the student body and physical facilities available for use.

The purpose of a student interest survey is to determine the approximate number of students in the high school who would be interested in enrolling in the Cooperative Distributive Education Program. One frequently used method for conducting a student survey is through the use of a planned assembly program. At that time the Distributive Education Program is explained through the use of a film, speakers from distributive businesses and/or through the use of former Cooperative Distributive Education students who can explain the

program. At the conclusion of the assembly, the survey forms may be distributed. As soon as they are collected, they should be tabulated to provide an estimate of the number of students who are interested in the Cooperative Distributive Education Program for the coming year. When an assembly is not feasible, the homeroom period may be used to contact those students who might be interested.

Advisory Committees

Vocational Advisory Committees, a publication of the American Vocational Association states, "Vocational education, more than any other type of education, needs close cooperation with the community. It trains workers for specific jobs and productive lives. It needs the periodic help and criticism of the real workaday world to be sure that its training courses are up-to-date and that its preparation for a life-work are useful. Advisory committees provide this necessary communicating link."

Advisory committees assume a vital role in the Cooperative Distributive Education Program as the instruction of the high school student is the joint responsibility of the CDE Program administrators and the distributive business leaders in the community.

The decision as to the type of advisory committee needed should be made jointly by the teacher-coordinator, the local school administration, and the local or county supervisor of the Cooperative Distributive Education Program.

A teacher-coordinator may find the need for one of the following types of advisory committees:

1. A general or overall committee to guide the total vocational program within the county.

2. A Distributive Education committee, which would specialize in advising the Distributive Education Program. Sometimes referred to as a "craft committee."

3. A specific advisory committee to assist with one phase of the overall Distributive Education Program.

A Distributive Education Advisory Committee can provide:

... A working relationship between school and business.

... Community understanding and active support for the program.

... Recommendations for types of training needed for specific occupations.

... Promotion for the total program within the community.

... Location of possible training stations.

... Opportunities for explaining the program to interested parties.

... A sounding board for new innovations.

... Material vital to up-dating the curriculum in the classroom.

... Classroom equipment and materials.

... Continual evaluation of the Distributive Education Program.

The establishment of such an important committee rests solely with the local administration. A first year teacher-coordinator may find it advisable to postpone the initiation of such a committee until he has been in the community long enough to know which people should be invited to serve. It is recommended that once the names have been secured, they should be submitted to the local supervisor or superintendent. Letters of invitation should then be sent to the prospective committee members from the school board office.

The composition of the advisory committee should represent a cross-section of distributive businesses in the community. The number of committee members

will vary but usually the group will range from five to eight.

Some suggested groups from which to seek members are real estate, insurance, chamber of commerce, retail merchants association, sales and marketing executives, department stores, chain stores, food industry, service businesses, specialty stores, local business and civic groups. The county school superintendent or a representative from the county school board should be included as a member of the committee.

The rotation of members should be planned in advance to allow for new ideas each year as well as provide a means for replacing a non-participating committee member.

Once the committee is selected and letters (see Appendix) have been sent requesting their participation, the teacher-coordinator should follow through with a personal visit to explain the purpose and importance of the committee and to remind the members of the first meeting.

The advisory committee will be most effective when:

... The reason for organizing the committee is well understood by its members and school officials. The committee is to serve in an advisory, not administrative, capacity; but should be assured that their recommendations will receive serious consideration.

... The committee has been given clearly defined functions and understand what is needed.

... The committee is competent to perform.

... The committee is desired by the school administration and the staff is willing to give time, energy and support towards its success.

The first meeting is important because it sets the stage for future meetings. An effective relationship must be established at the beginning in order

to maintain continued cooperation. To assure proper orientation for committee members, a suggested agenda is included below:

## *ADVISORY COMMITTEE AGENDA*

I. Welcome and remarks by school administrator.
II. Introduction and biographic material on each committee member.
III. A statement of the role of the committee and how it is expected to be of assistance to the school and the Distributive Education Program.
IV. A brief sketch of the history of the school.
V. The nature and objective of Distributive Education, the philosophy and general operating policies of the program.
VI. A brief outline of opportunities or questions confronting the program.
VII. Plans for the expansion of the program.
VIII. Organization of the committees:
   a. Selection of chairman and secretary (the teacher-coordinator should serve as ex officio member of this committee)
   b. Selection of dates and time for meetings (perhaps two to four times per year)
IX. Question and answer period.
X. Adjournment

Upon completion of the organizational meeting of the advisory committee, some topics for future meetings might be:

... Improving the classroom instructional program.

... Improving the supervision and instruction provided by the training stations.

... Development of the Job Sponsor Training Program.

... Promotion of Career in Marketing Week.

... Developing training plans for various distributive occupations.

... Planning the recruitment and screening of future DE students.

... Development of better understanding of the program within the community.

... Planning the Employer-Employee Banquet.

... Expansion of the Distributive Education Program in the local high school.

... Creating a speaker's bureau from distribution for high school classes.

An active and participating advisory committee becomes the sounding board for the teacher-coordinator and his plans for the total program. Each committee member needs to feel a responsibility towards the Distributive Education Program and should be consulted when necessary. It is only through the joint cooperation of the school and business community that the objectives of the Cooperative Distributive Education Program can be met and the needs of each student fulfilled.

Organizational Plans

Decisions concerning the organization of the Cooperative Distributive Education Program are based on such factors as:

1. Opportunity to serve a broad spectrum of students of high school age.
2. Availability of adequate opportunities for paid, part-time employment in distributive businesses for youths 16 years of age and older.
3. Number of prospective enrollees meeting minimum personal employability requirements.
4. Requirements for graduation.

Three organizational plans are available to a high school for the Cooperative Distributive Education Program. These plans include:

Plan I: One class period for two years

This plan permits a student to enroll in Cooperative Distributive Education in the eleventh year and attend class one hour daily for two years. Under this plan, the student receives two credits for each year of successful participation in the Distributive Education Program. Once credit is earned for classwork, and one credit is

earned for occupational experience.

Plan II: One class period for one year

Under this plan, the student starts the program in his twelfth year. He attends class for one hour daily and participates in occupational experience for which he receives a total of two credits.

Plan III: Two class periods for one year

The student begins the program in his twelfth year and attends class for two hours daily for one school year. One hour is spent in group instruction and one hour is spent in individualized instruction. Three credits are granted the students of which two are for classroom instruction and one for occupational experience.

As mentioned previously, the Cooperative Distributive Education Program may serve those students who have completed one year of Project Distributive Education and who desire to continue their distributive training through the cooperative method of instruction. Consult Bulletin 74H-6, The Project Plan for Distributive Education in Florida High Schools, for further information concerning the project plan of instruction and the organizational patterns available when both the project and cooperative plans are used simultaneously in the same school.

## Counseling and Selection of Students

The Cooperative Distributive Education Program differs from the regular academic subjects offered in the comprehensive high school. It is not a program designed for every student and, therefore, requires that certain standards of acceptance be met before a student is enrolled. Distributive Education is designed to prepare the student for gainful employment in market-

ing. In order to build a quality Cooperative Distributive Education Program, the teacher-coordinator must maintain a well-planned and balanced program of guidance activities. Proper student selection is important because:

1. The distributive occupations require certain mental, social, and personal attributes.
2. Certain students, due to their interests, abilities, and temperament, will achieve greater satisfaction and success in the field of distribution. Others should be counseled into areas of endeavor better suited to their individual attributes.
3. The students selected for the Cooperative Distributive Education Program will represent the entire school when they are placed in the business community.
4. The student must have parental approval before accepting an on-the-job training position and their understanding that the laboratory work is an essential part of the training program.

The teacher-coordinator should maintain a current file of prospective students throughout the school year. Individual counseling is necessary in selecting students and should be conducted year round. Sources for obtaining names of potential Cooperative Distributive Education students are referrals from distributive employers, students who apply for work permits, students who inquire about part-time employment, recommendations of current Distributive Education students, guidance counselors at the junior or senior high level, students and parents who indicate interest during Career Day or College Night, recommendations of faculty members, and the study of cumulative folders for indications of vocational interests or aptitudes.

The attraction of satisfactory students should be spread throughout the entire year and not appear suddenly at the beginning or end of the school year. The promotion should be an enthusiastic one and should be planned to fit into the daily school schedule. The following list provides some suggested means for this year-round activity:

1. Prepare and duplicate, for student distribution, handout material explaining the Distributive Education Program.
2. Arrange personal interviews with sophomore and junior students.
3. Arrange for the coordinator or student representative to go to home-rooms and talk about the program.
4. Encourage current Cooperative Distributive Education students to explain the program to their friends.
5. Have a "Guest Day" when Cooperative Distributive Education students bring a guest who might be interested in marketing as a career.
6. Obtain a list of students who are already working in distributive businesses but who are not enrolled in the Cooperative Distributive Education Program. Call a meeting and tell them about the program.
7. Work cooperatively with the guidance department.
8. Obtain the results of aptitude or interest tests and compile a list of students whom you can profitably interview for the Cooperative Distributive Education class.
9. Ask the distributive businesses of the community to promote the class by encouraging students who come to them for part-time jobs to enroll in the program.
10. Have other teachers counsel appropriate students into the program.

11. Distribute printed publicity, such as:

    a. Articles in school papers

    b. Articles in local newspapers

    c. Promotional brochures to be distributed during all recruitment

    d. Materials posted on school bulletin boards.

12. Use the DECA Program to keep the Distributive Education name before the public.

13. Use instructional display regarding Distributive Education when the display area is available.

14. Encourage active participation in community and school events to keep the Distributive Education name before students at all times through the following activities:

    a. Style shows

    b. Sponsored dances

    c. DECA Week

    d. Business survey

    e. Individual marketing studies

15. Cooperate in Career Day planning so that speakers are there representing the field of marketing.

16. Request school and local papers to run a regular news column about Distributive Education.

17. Plan and schedule assembly program for the entire student body

    a. Invite a panel of merchants to discuss the advantages of the field of marketing as a profession.

    b. Elaborate, through skits, some of the areas of study within the

classroom such as job interview--the wrong and right way.

18. Present the story of Distributive Education before civic, professional and lay groups.

Four factors are considered of prime importance in the final selection of students for the Cooperative Distributive Education Program:

a. Student records (Cumulative folders including grades and attendance records)

b. Personal interviews with students by the teacher-coordinator

c. Discussion with the guidance personnel, teachers, and parents

d. Determining that the individual student will benefit from the program.

Certain factors should be considered in the evaluation of the student applications for the program. The following criteria are suggested as a basis for determining the characteristics, which are desired in the prospective Distributive Education student:

... Student should indicate an interest in pursuing a career in the field of distribution and marketing.

... Student should be able to profit from the subject matter taught.

... Satisfactory grade average and required credits.

... Ability to show good judgement.

... Should show potential for employment and willingness to work.

... Is 16 years or older.

... Satisfactory recommendations and/or acceptance from other students including present Distributive Education students.

... Satisfactory ratings from other teachers (see Appendix)

... Satisfactory attendance record.

... Good health.

Most of the above information may be secured from the cumulative folders or permanent records of the student. This provides the source for grades, attendance, test scores, comments of former teachers, and any disciplinary actions regarding the student. Ratings of a student completed by homeroom teachers, English teachers and/or other subject matter teachers should be handled in a confidential matter. The student application (see Appendix) presents a picture of former employment as well as other pertinent information regarding the student. The student agreement (see Appendix) requires parents' signature and approval.

To assure receipt of all information needed on each student, a careful record should be kept throughout the selection period. The final decision on acceptance rests with the teacher-coordinator; therefore, he must weigh all factors concerning each student. A simple check sheet (see Appendix) will assure the teacher-coordinator of having obtained all information necessary for the decision.

The student interviews should be scheduled over a period of time. While the final selection of the students may not be required until February or March (depending upon the individual school's guidance program) the interviews should be held throughout the year.

The initial interview is designed for the teacher-coordinator to meet the student, learn of his abilities, attitudes, and interests and provides an opportunity to explain the Cooperative Distributive Education Program. The student should be given adequate time to ask questions. Information should be presented on career opportunities in distribution. If mutual interest is indicated on the part of the student and the teacher-coordinator, the appli-

cation blank should be completed. Arrangements should then be made for a follow-up interview with the student.

A file folder should be kept on each student interviewed with records included on subsequent interviews until a decision is made. If the student is accepted for the program, this record becomes part of the permanent Distributive Education file, which will eventually contain records of occupational experiences and other pertinent information of the student. Each student who is selected must be notified of the decision.

Student selection for Distributive Education is a systematic method of counseling students into the program of study which will benefit them the most. It is neither designed for elimination of discipline problems, nor as a method for directing primarily "honor" students or low-ability students into a class for their benefit alone. The most important consideration in student selection is whether or not the individual student will receive benefits from participating in the Distributive Education Program in preparation for his chosen occupation.

## Coordination

The Cooperative Distributive Education Program is composed of three basic elements: classroom instruction, occupational experience, and DECA chapter activities. COORDINATION involves the successful blending of these three parts to give the student the best preparation for his chosen occupation. The teacher coordinator is responsible for coordinating classroom instruction with meaningful experiences on the job. Every professional action, contact or activity between student, school, community and the teacher-coordinator involves coordi-

nation activities in some respect. COORDINATION IS A YEAR-ROUND, FULL-TIME ACTIVITY.

Distributive Occupations

For an occupation to be suitable for the training of a Distributive Education student, it must meet two basic standards:

1. The occupation must be a distributive occupation followed by employees directly engaged in merchandising activities or in direct contact with buyers and sellers when:
   a. Distributing to consumers, retailers, jobbers, wholesalers and others, the products of farm and industry.
   b. Managing, operating, or conducting a commercial or personal service business, or selling the service of such a business.
2. The training proposed for the student should give practical, progressive job experiences which supplement and correlate with the classroom instruction given by the Distributive Education teacher-coordinator.

Training of distributive education students in non-distributive occupations cannot be approved for several valid reasons:

1. Classroom instruction can be effective, pertinent, and meaningful only when students have similar occupational experiences and needs.
2. The distributive education curriculum, both group instruction and individual instruction, has been prepared to give maximum benefit to employees in bona fide distributive occupations.
3. The qualifications and occupational experience background of the coordinators qualify them to work only in distributive occupations.

4. In its origin, and in all subsequent legislative acts and policy bulletins, use of appropriate distributive education funds is authorized only to train students for distributive occupations.

For these reasons it is evident that a valid educational program in distributive education requires a well-defined discipline of instruction and an occupationally competent coordinator.

The classifications of distributive occupations and businesses can be found in the United States Office of Education release, Instructional Codes and Titles (see Appendix). Distributive Education training and placements are limited to the distribution and marketing (group 4) areas. Those businesses and occupations not listed in this classification would not be approved as Distributive Education training agencies for students.

## Selecting An Occupational Goal

In assisting a student in the selection of his occupational goal, the teacher-coordinator should attempt to counsel the individual toward a realistic objective. Many young people are unsure as to what a distributive occupation is, and therefore, the teacher-coordinator must determine through instruction, testing, and evaluation, the student's interest and potential. The teacher-coordinator should help the student determine his immediate and long range goals, and assist him in the development of educational plans which will enable him to achieve those goals.

The choice of a student's occupational goal is usually a developmental process dependent upon interest, aptitude, and ability. The teacher-coordinator must recognize this and provide flexibility and counsel for the student in his

selection of a suitable occupational goal. A first year student might simply be interested in general retailing, and therefore, his occupational goal would fall in the area of 4117 Retailing in the USOE classification. After a year of instruction and occupational experience, the student might then decide to specify 4102 Apparel and Accessories and concentrate his efforts toward this goal. Follow-up studies of Distributive Education graduates will often reveal when such counseling has been beneficial in establishing the student in the field for which he has trained.

In counseling with the students regarding their selection of career objectives and training agency placement, the following factors should be considered:

1. Opportunity for employment after training is considered essential. If an occupational area is overcrowded or is gradually diminishing in importance, it would be difficult for those who complete training to secure employment.
2. Stability of employment is worthy of consideration from the standpoint of the permanency of an occupation. Is it an occupation which is changing or will it be absorbed through specialization or technological change?
3. Opportunity for advancement should be considered by the student and teacher-coordinator. Is it an occupation in which, with diligent application and study, a student could advance to a higher position?
4. Length of the training period should be considered by the teacher-coordinator and the student to determine the length of time necessary to become proficient.

5. Training carry-over or transfer should be considered. Will the training enable the student to adapt more easily to employment in some other occupation?

6. Whether the occupation will be seasonal or whether it is one in which the worker can be employed throughout the year is an important consideration.

7. Salary is important. It is felt that a teacher-coordinator in counseling with students and parents should be able to give some information as to the compensation employees receive in the vocation being considered.

Selection of Training Agencies

It is the occupational experience that provides the practical application of information discussed and studies in the classroom. The selection of the proper training agency, which will provide the student with his experience is vital to the success of the total program. Once the community survey is completed, the teacher-coordinator should consider the following factors regarding each potential cooperating agency:

... The business should be distributive in nature.

... The manager and his organization should understand the Distributive Education Program and their part in providing training for the students.

... The organization should enjoy a reputation for integrity and progressiveness in the community.

... Opportunity for year-round-part-time employment should be available.

... Working conditions should provide good training atmosphere.

... Proper supervision of the student-learner should be provided.

... Wages should be comparable to similar occupations in the community.

... Location should be as convenient as possible with respect to the student, the school, and the teacher-coordinator.

... Adequate provision should be available for advancement on the job when appropriate.

The teacher-coordinator must be constantly alert as to the effectiveness of the on-the-job training and occupational experience which each student receives. Constant evaluation is necessary in order to either assist the organization in improving the situation or to remove their name from the list of quality training stations. The responsibilities and conditions that a training agency should understand are:

1. That the cooperative plan is a training program and not a school employment agency, and that the firm will be asked to help the student-learner with some individual study assignments.
2. That the employer is considered a partner in the program of training and should assist the school by providing planned occupational experiences and on-the-job instruction.
3. That training stations are to provide an average of at least 15 hours of employment a week throughout the school year, preferably at least half of this time during the released school time of the student-learner, according to standards set by the school.
4. That a monetary wage, according to state or federal wage laws, will be paid all beginning student-learners and that this amount may be

increased proportionate to their productivity.

5. That the student-learner is enrolled in classes at the school where he is receiving instruction directly related to his work activities and occupational objectives.

6. That the student-learner should have opportunities to move from one specific job activity to another in order to gain various experiences leading to his occupational goal.

7. That the student-learner should be placed in the same employment status as that of other part-time employees in matter of social securi insurance, and labor laws. (Union contract should be checked where applicable).

8. That the teacher-coordinator will visit the student-learner, observe his job performance, suggest to the employer or sponsor sound methods of on-the-job training and determine the job activities to which classroom instruction should be related.

9. The periodic ratings based on the job performance and progress of the student-learner will be made by the employer or the sponsor and reported to the coordinator.[1]

While the coordinator should not take the responsibility for interpreting or advising businessmen regarding Federal, State and local laws applying to youth employment, he should consider carefully such factors as minimum wage, hours of labor for minors under 18 years of age, employment certificates, and hazardous occupations. Distributive Education students must comply with all requirements of the Florida Child Labor Law and the Fair Labor Standards Act whenever applicable.

For information relative to interpretation or procedures of these laws, the teacher-coordinator should check with the local State Employment Service Office or any of the agencies listed below:

... Florida Child Labor Law

... Florida Industrial Commission

... U. S. Department of Labor

Student Placement

The primary consideration in student placement is the career objective of the student. This requires that student placement be handled individually and carefully. Regardless of the quality of a potential training agency, unless it will provide the student with the experiences necessary to prepare him for gainful employment in his chosen vocation, it is not the appropriate training station for that particular student.

Conditions for satisfactory placement are:

... The Student must be satisfied with the organization in which he is to work. He must be assured of receiving training on the job and the opportunity to develop and advance.

... The Training Agency must be satisfied with the student. They must feel they are receiving the best qualified student for contribution and growth of the organization.

... The Teacher-Coordinator must be satisfied with the training objectives set up by the organization for the student.

Upon ascertaining that a student is ready to seek employment and after making preliminary arrangements with the employer, a card of introduction is given to the student to present to his prospective employer (See Appendix). The teacher-coordinator may wish to arrange the time of the interview, or he

may allow the student to call and set his own time. If possible, the student should not be placed in a training agency representing the Cooperative Distributive Education Program until he has completed the orientation session.

The final selection and placement of an individual student in a training agency is, of course, the responsibility of the employing agency. The student must understand that the Distributive Education Program is not an employment agency, but that each student must be prepared to successfully present his qualifications to the potential employer.

It may prove feasible to offer an employer a choice of more than one student for an opening. In either case, the teacher-coordinator must remain in close contact with the student and the employer so that information is kept current on positions which are filled and those which are still available. When an employer rejects a student for a job, the teacher-coordinator should counsel with the student to assist him in correcting the reason for the rejection.

## Developing the Training Plan

The training plan provides a continuing record of the student's occupational experiences and is a part of each student's permanent record (see example in Appendix). The plan is developed through conferences between the teacher-coordinator, the training sponsor, and the Distributive Education student. It is based on the student's career objective and should document instruction and experiences received on the job, as well as individual or group projects in which the student engages as he prepares for his career.

The progress report (see example in Appendix) is the device which the training sponsor uses to record the progress of an individual student in variou

phases of his job performance. The best results are obtained when the training sponsor and the teacher-coordinator review this progress together.

The progress report does not serve as a means of ranking the student, but rather it should indicate the growth and change of an individual's performance over a period of time. It should be clearly understood that the student is not in competition with other students or employees of the training agency.

Although separate grades may be recorded, occupational experience is considered an integral part of the Cooperative Distributive Education Program. The grades received for the student's performance should represent a composite of classroom instruction and on-the-job training. The student's performance in both the classroom and training agency are dependent upon each other; therefore, a poor evaluation in either of the areas reflects a lack of application in the other.

Factors which the training sponsor should consider when rating a student's progress include:

... Avoid the tendency to give same rating each time. (Don't compare the previous report until the current one is completed).

... Avoid the halo effect of marking all areas either excellent or poor. (Encourage the sponsor to discuss each area as it is rated).

... Include comments after each area evaluated. (These written statements are most helpful when the teacher-coordinator reviews the ratings with the student).

... Complete the progress report when you have adequate time to thoroughly and fairly do so.

## COORDINATION ACTIVITIES

The following chart provides an indication of the responsibilities undertaken by the teacher-coordinator during the afternoon activities.

| COORDINATION VISITS | | | PUBLIC RELATION VISITS |
|---|---|---|---|
| To Get Information | To Give Information | To Observe | Appear on Program of Civic Group |
| Take community survey | Explain Cooperative Distributive Education | Student on the job | Work with associations:<br>Retail Merchants<br>Chamber of Commerce<br>Better Business Bureau<br>Sales & Marketing Executives |
| Survey new job opportunities | Relate class work to occupational experience | Working conditions | Work with P.T.A. |
| Develop training plan with sponsor | Review job rotation plan of student | Co-workers of student | Visit feeder schools to explain the Cooperative Distributive Education Program |
| Secure instructional material | Commend training sponsors | Displays done by student | Make home visitations:<br>To explain program to parents<br>To observe student in environment |
| Seek wage adjustment of student | Show employer some of student's classwork | Store-wide promotions | Take articles to local radio, television stations or to newspaper |
| Obtain progress report on student trainees | | | Attend local planning meeting of Distributive Education personnel |
| Learn of full-time opportunities for graduates | Explain Advisory Committee duties | | |
| | Explain DECA competitions | | |
| | Conduct Sponsor Development meetings | | |

After the rating is obtained, it is important that the teacher-coordinator review the progress report with the student. It is not necessary that the student see the actual form, but he should be made aware of his performance in the various areas. This conference should be private, and adequate time should be provided to explain the ratings to the student. When ratings are low, ways in which the student can improve should be discussed; the student should be commended when his ratings indicate improvement. The progress report should become a part of the student's permanent Distributive Education file after it has been reviewed.

Coordination Visits

Planned coordination visits provide the opportunity to see the student at work, to observe his performance, to meet with the training sponsor, and to establish an effective public relations program.

The teacher-coordinator should visit each student and training sponsor at least once during a school's grading period. Some training stations may require more frequent visitations. The effectiveness of coordination comes through advance planning with the sponsor and with a worthwhile purpose for each visit.

Sponsor Development Program

The Sponsor Development Program is a means by which the teacher-coordinator can bring all of the student's training sponsors together and train them as a group rather than through a series of individual visits. This involves providing group instruction regarding the curriculum of the student, procedures used in evaluating the student's progress, necessary records and reports,

methods of techniques of supervision, and job instruction training. This group process of sponsor training saves valuable time, which can then be directed toward more individual attention for the student himself.

The Sponsor Development Program gives each student a "downtown" teacher who can relate the occupational experience of the student to the classroom instruction, assist in improving the student's job proficiency, and provide lines of supervision and communication between the business organization and the school. Not only does this benefit the school in the high school Distributive Education Program, but the Adult Distributive Education Program is benefited as well. After a sponsor has been trained in the methods and techniques of effective supervision, he will usually encourage his co-workers in the organization to participate in the Adult Distributive Education classes, and may often agree to teach basic employee classes for the program.

Classroom Facilities and Equipment

The facilities designated for the Cooperative Distributive Education Program should simulate business conditions as closely as possible. While each cooperative student is provided a laboratory through his occupational experience, the classroom or school laboratory should provide facilities for the following kinds of instructional activities: class discussions, individual, group and committee work, use of various types of audio-visual aids, preparing displays and exhibits, demonstrations and role playing.

The actual size of the classrooms will vary; however, it should be adequate to handle an optimum class size of 25-30 students per class. Maximum enrollment in the Distributive Education Program, however, is limited only by

local scheduling of classes and adequacy of staff personnel. Office space is needed for the teacher-coordinator who will spend a substantial amount of time interviewing and counseling individual students. Because of the need for frequent contact with the business community, a telephone should be available for the teacher-coordinator.

The laboratory-classroom should contain the following types of equipment: conference tables and chairs, teacher desk, chair, lecturn, portable chalk board, bulletin board, flannel board, sales counter, display case, bookcases and magazine racks, shadow boxes, three-way mirror, mannequins, tape recorder, adding machine, film strip projector, overhead projector, and cash register. The audio-visual equipment listed above does not necessarily have to be owned by the Distributive Education Department, but is is essential that the teacher-coordinator have ready access to the equipment.

If equipment is purchased, it should be justified by the educational service provided the students. All material used in the classroom-laboratory should be of equal quality of that being used in the actual business firms. Each school should be exemplary in the service ability and manner of maintenance of its equipment.

## CURRICULUM PLANNING

The discipline of a given course of study represents a definitive area of instruction unique to a particular body of knowledge. The occupational competencies required for employment opportunities in distribution provide the basis for the discipline of Distributive Education.

### Competencies Required for Distributive Education

The occupational competencies required for distributive employment are:

MARKETING competency - A person engaged in distribution has demonstrated accomplishment in the performance of one or more of the functions of distribution, which are in summarized form: selling, finance, buying, transportation, market research, storage and management. While the immediate job responsibility is generally centered on one of these functions, an accomplished worker has understandings and appreciations of all the functions within the business enterprise. Out of these functions and supplemental understandings about distribution come the body of knowledge, which we call the discipline for distribution.

SOCIAL competency - A person engaged in distribution has a set of personal characteristics which are vocationally relevant. Distribution is characterized as being people-oriented, not machine-oriented, and as such human relationships are of paramount importance. Personal appearance, traits, and attitudes comprise this social competency which becomes a qualifying factor in employment.

BASIC SKILL competency - The person engaged in distribution makes constant application of the basic skills of communications and mathematics to his employment situation. The whole field of distribution revolves around communications. This fact places a premium on one's facility with these tool subjects as a basis for employment in distribution.

TECHNOLOGICAL competency - One engaged in distribution is closely associated with a specialty, typically a product or service. The degree of success is dependent upon the knowledge he possesses of this specialty which, in view of the growing complexity of products and services being produced in the economy, is referred to as his technology. A functioning knowledge of this technology, whether it be furniture, insurance, fabrics, automobiles, petroleum or data processing equipment becomes the focal point upon which other knowledges and skills are applied.[1]

## Curriculum of Cooperative Distributive Education

The curriculum for the Cooperative Distributive Education Program is designed as the career development curriculum and is based on the discipline of distribution. This curriculum provides vocational instruction in marketing to prepare students for the career development job level, which involves competencies and responsibilities beyond those required for the basic job level and less advanced than those needed by a specialist in distribution.

With the discipline based on the competencies required in distribution, the Distributive Education teacher-coordinators of Florida have developed their curriculum around five broad areas of study. Each area represents one phase of related instruction in the broad field of distribution. The areas

are further refined into units of study. A unit of study presents a series of planned lessons built around one major area of study.

The units of study are arranged in sequential order, whereby, a progression of learning continues through all levels of instruction. This progression of learning is achieved by first placing emphasis on "what is it?", followed by "how to do it", and emphasis on "why" during the second year of the program.

This sequence is such because vocationally oriented students are initially interested in the "what" and "how" of a subject. Their interest in the "why" of that subject is then developed after the students feel a personal sense of involvement through performance of job oriented activities and projects.

Each unit includes a detailed list of suggested references including textbooks, pamphlets, and films. The teacher-coordinator should make every effort to acquire as many of these references as possible for the Distributive Education classroom and library.

The purpose of a unit of study is to provide a skeleton of ideas, but the substance of the subject depends upon the preparation of the teacher-coordinator, the students, and the local community. The unit is a road map designed to serve as a guide ONLY in the development of daily lesson plans. Adaptation and flexibility are the KEYS!

SUGGESTED TEACHING CALENDAR

COOPERATIVE DISTRIBUTIVE EDUCATION

FIRST YEAR

| | | |
|---|---|---|
| Unit I. | ORIENTATION - 2 Weeks | |
| | A. Introduction to Distributive Education | 2 days |
| | B. Getting a Job | 5 days |
| | C. Personality Development | 3 days |
| Unit II. | MERCHANDISING - 12 Weeks | |
| | A. Sales | 18 days |
| | B. Advertising | 12 days |
| | C. Display | 10 days |
| | D. Merchandise Planning and Stock Control | 10 days |
| | E. Consumer Credit and Finance | 5 days |
| | F. Public Relations | 5 days |
| Unit III. | MARKETING IN OUR ECONOMY - 6 Weeks | |
| | A. Economics | 10 days |
| | B. Marketing | 20 days |
| Unit IV. | ORGANIZATION, LOCATION AND FINANCE - 5 Weeks | |
| | A. Organization | 13 days |
| | B. Location | 7 days |
| | C. Finance | 5 days |
| Unit V. | MARKETING MANAGEMENT - 4 Weeks | |
| | A. What is Management? | 2 days |
| | B. Broad Areas of Responsibility | 5 days |
| | C. Specific Areas of Responsibility | 13 days |
| | | 145 Days |

## SUGGESTED TEACHING CALENDAR

## COOPERATIVE DISTRIBUTIVE EDUCATION

## SECOND YEAR

| | | |
|---|---|---|
| Unit I. | PERSONAL SUCCESS - 1 Week | |
| | A. Planning Your Future Through Distributive Education | 2 days |
| | B. Personality Development for Supervision | 3 days |
| Unit II. | MERCHANDISING - 13 Weeks | |
| | A. Buying | 10 days |
| | B. Sales Promotion and Advertising | 30 days |
| | C. The Art of Selling | 15 days |
| | D. Consumer Credit | 10 days |
| Unit III. | ORGANIZATION, STORE LAYOUT AND FINANCE - 6 Weeks | |
| | A. Organization | 10 days |
| | B. Store Layout | 5 days |
| | C. Finance | 15 days |
| Unit IV. | MARKETING IN OUR ECONOMY - 4 Weeks | |
| | A. Economics | 10 days |
| | B. Marketing Activities and Trends | 10 days |
| Unit V. | MARKETING MANAGEMENT - 6 Weeks | |
| | A. Consumer Orientation | 4 days |
| | B. Product Management | 5 days |
| | C. Price Management | 10 days |
| | D. Place Management | 5 days |
| | E. Promotion Management | 4 days |
| | F. Summary | 2 days |
| | | 150 Days |

The success of the Cooperative Distributive Education Program will be reflected in the finished product--the subject, and his growth will relate directly to the planning, effectiveness and strength of the curriculum. The steps necessary to success are:

1. Determine the sequence of the units of study.
2. Prepare an outline showing unit and major topics.
3. Designate the time required for each topic.
4. Develop the daily lesson plans, adapting them to the community, the students, and the occupational experiences of the student-learner. Prepare the daily lesson plans for two weeks in advance.

The suggested teaching calendar included in this guide is to serve as a beginning. If this guide is followed, the first three steps involved in curriculum planning will have been completed.

The suggested sequence allows for only 29-30 weeks in planning. The remaining six to seven weeks of school are for testing, other school activities and additional units which the teacher-coordinator may feel are appropriate for the students' particular needs.

Effective curriculum planning offers assistance through:

... Presenting material in a logical and organized manner.

... Providing a record of what is taught each year.

... Giving indications as to strengths and weakness of each topic.

... Eliminating unnecessary repetition in certain topics.

... Assisting a new teacher-coordinator or substitute in planning.

## The Vocational Approach to Teaching

The effective teacher-coordinator develops his daily lesson plans on the basis of the learning outcomes desired. The vocational classroom revolves around practical application of the subject matter being taught. Each student,

through his occupational experience, is provided the opportunity of putting classroom theory into actual application in his training station. The teacher-coordinator must, therefore, apply the vocational approach to teaching and provide experiences during classroom time that will allow the student to transfer the proper knowledge, attitudes, and skills to the occupational experience.

Through the use of progress reports, visits to the training stations, and individual conferences with the students, the teacher-coordinator gains the necessary information which will enhance classroom discipline and lend a vocational approach to subject matter. In order for a topic to be vocational, it should be:

... Related to the job or occupational experience as opposed to straight theory courses, although it may include theory.

... Designed for a particular group and directed to their needs.

... Effective and productive to the learner.

... Provide training that ultimately results in gainful employment in distribution.

## Methods of Instruction

The success of any method of presentation of a subject is dependent upon the planning and preparation done by the teacher-coordinator. The effectiveness of any method will be determined by how much and what is learned by the student. A diversity of methods becomes the key in Cooperative Distributive Education. The student does not rely on any single textbook, but rather on a variety of textbooks, supplementary materials, and information received from the teacher-coordinator combined with his occupational experience. The specific method of presentation must be suitable to meet the student's needs.

Several vocational methods of instruction which have been found to be effective are presented below:

## *VOCATIONAL METHODS OF INSTRUCTION*

| Method | Suggested Use |
|---|---|
| A. Telling Methods | |
| 1. Story Telling | To give examples: tell related experiences of student or teacher-coordinator. |
| 2. Audio Aids | Using records, tape recorder. |
| 3. Lecture | Present new material to group. |
| B. Discussion Methods | |
| 1. Directed Discussion | Useful in obtaining information check on learning of student. |
| 2. Conference Technique | Used to encourage group thinking. |
| 3. Panel Discussion | Provides opportunity for student to do individual research and present to group; use with outside speakers. |
| C. Directed Observation | Prepare group to see a teaching tool such as a movie, a poster, a field trip, a pass-out sheet; but point out what they should look for. |
| D. Case or Incident Method | Using a true incident to present a philosophy, idea or an attitude. Discussion follows presentation. |
| E. Role Playing | Students act out a situation; good to use in competition run-offs. Combine with case study. |
| F. Brainstorming | Encourage free thinking by throwing out a subject and allowing group to suggest use or solution. |
| G. Team Teaching | Using several teachers to present given subject area. Other vocational teachers can assist in Orientation unit. Home Economics Department can assist in grooming topic. |

H. Individual Student Activity — Individual activity that applies theory in practice.

Individualized Instruction

To assist the student in better understanding what is involved in the particular functions of specific job situations, individual study is incorporated as an integral part of the Distributive Education Program. This phase of the program provides a balance of instruction in all phases of the student's employment endeavor in order to produce both understanding and progress.

Individualized instruction should stem from the units of study included in the curriculum for group instruction. For example: when the section on "Salesmanship" is studied during group instruction, the students may be required to develop product analysis forms or give sales presentations on products or service they are actually handling in their respective training agencies. Additional suggestions for individualized assignments are presented below:

1. Advertising - ad layouts of products or service student handles.
2. Display - building interior and/or window display with products student handles.
3. Merchandise planning and stock control - developing merchandise manuals; study of stock control records and forms used in student's training agency.
4. Consumer Credit - study of consumer credit plans used in student's training agency; drafting collection letters.
5. Organization - study and development of organizational chart of student's training agency; study of job descriptions in training agency.
6. Store Layout - study and sketching of store layout in student's training agency.

7. Finance - study of control records maintained in student's training agency; study of company's insurance program.
8. Market Research - creative marketing research project in student's field of employment.
9. Pricing - study of pricing methods used in student's training agency.

Distributive Education Clubs of America

DECA identifies the program of youth activity relating to the Distributive Education Program. The Distributive Education Clubs of America is the only national youth organization operating through the public schools to attract young people to careers in marketing and distribution. The tag line for the organization is, "Developing Future Leaders for Marketing and Distribution." The major purposes of this youth program are:

... To develop a respect for education in marketing and distribution which will contribute to occupational competence.

... To promote understanding and appreciation for the responsibilities of citizenship in our free, competitive enterprise system.

A co-curricular activity is one which enhances and enriches an instructional program rather than an extra-curricular activity which is conducted outside the realm of the classroom. The purpose and aims of DECA parellel the purposes and aims of the Distributive Education Program itself. DECA, therefore, becomes an integral part of classroom and on-the-job instruction and provides greater scope and depth to the total instructional program.

DECA Organization

Because of the cooperative nature of the Distributive Education Program,

the Distributive Education students are somewhat limited in the number of activities in which they can participate within the school program. DECA is organiz to allow every student enrolled in the Distributive Education Program to be eligible for membership.

The levels at which they participate are:

LOCAL - Each chapter elects its own student officers and the Cooperative Distributive Education teacher-coordinator serves as the chapter advisor. The constitution provides for a president, vice-president, secretary and treasurer. Some local chapters add a corresponding secretary, parliamentarian, and historian. Other chapters appoint these offices along with regular standing committees. These elections and all subsequent meetings are conducted in keeping with the rules of parliamentary procedure.

STATE - All of the affiliated chapters within a state comprise the State Association of DECA, which is under the leadership of the State DECA Advisor. Each State Association elects its own student leaders at the Annual State Leadership Conference. The Official Florida DECA Handbook explains the procedures for nominating local students in these elections as well as other regulations of the State Association. The DECA Sunshine is the official publication of the Florida State DECA Association.

NATIONAL - National DECA is composed of State Associations. Student delegates elected by each state in turn elect their own national officers. Policy for national DECA is governed by DECA, Inc. the legal entity of the adult educators responsible for the youth program of DECA.

National DECA maintains offices in Washington, D.C. manned by an executive director, a director of member services, and a public information director.

The Distributor is the official magazine published by DECA and is distributed to every dues-paying member at all levels.

The DECA emblem is diamond shaped with the words "Distributive Education Clubs of America" surrounding a wrapped package. The four points of the DECA diamond symbolize vocational understanding, civic consciousness, social intelligence, and leadership development. The wrapped package stands for the close cooperation of student, teacher, parent, and businessmen in assisting Distributive Education students to acquire a well-rounded education. Each of the points on the emblem represents an area of educational activity, which serves to bring the chapter activities into even a closer relationship with the Distributive Education Curriculum.

## Project Competitions Program

The project competitions program is designed primarily to stimulate student interest in improving career-related knowledge and skills. The competitions emphasize the importance of learning through preparation and participation. Individual achievement is recognized in a sequence of local, state and national eliminations. Each competition in the program has a specific relationship and value toward enriching a particular area of study within the Distributive Education curriculum.

The value of the project competitions program stems from each student having the opportunity to participate. The preparation of individual students for a competition when the subject matter has not been covered in the class and/or through the occupational experience defeats the co-curricular value of

DECA. The important factor is not to have a participant in every competition each year, but to provide tools and techniques for strengthening the curriculum directed toward all students. For further information, refer to the Florida DECA Handbook which explains the project competitions program in detail.

Program of Activities

It is important that the students understand that while they are primarily responsible for all chapter activities, they must follow certain standards and understand the relationship between the curriculum, the occupational experience, and the DECA Chapter.

Professional meetings should be conducted to enrich the curriculum being taught within the classroom. When teaching the unit on "advertising", the chapter might plan a professional meeting to include a field trip to a local newspaper or advertising agency. A speaker or film based on a particular unit of study provides an excellent means of getting the information across to the students.

Another means of bringing DECA into the curriculum is through the use of manuals to provide depth and understanding of a subject area. DECA activities lend vocational application to the instructional program in much the same manner as does occupational experience.

Customer surveys are a tool used in developing students ability to recognize business problems, analyze customer habits, and contribute to the improvement of the community. These surveys are usually conducted in connection with a chapter or class project and are then presented in final form to a business group or submitted as a project competition through DECA.

A suggested guide for establishing a year's program of work in DECA is found in the Appendix. This planning should be done by the students and the teacher-coordinator.

To assure the accomplishment of desired results in planning any DECA activity, the following questions should be asked during preparation.

1. Does the planned activity strive toward the purposes of the Distributive Education Program?
2. Does the experience provide for developing the ability to lead and follow?
3. Are the experiences planned based on student interest and career objectives?
4. Are we providing for active support and participation from business leaders and parents?
5. Are the projects and activities contributing to the overall objectives of the school?
6. Is there evidence of a respect for student leadership?[2]

DECA chapter activities and projects are usually classified into five broad areas: professional, financial, civic, service, and social.

PROFESSIONAL - As a professional organizaton any activity undertaken for ultimate improvement of the student becomes acceptable. Major professional activities include: chapter meetings, the project competitions, guest speakers, and the annual Employer-Employee Banquet. This banquet is an opportunity to show appreciation to the employer and training sponsor, as well as to provide better understanding and acceptance of the Cooperative Distributive Education Program with school personnel,

parents, and business leaders.

FINANCIAL - Individual chapters determine the number and type of financial activities in which they wish to participate. First, the group must decide their obligations such as state and national dues, expenses for attending conferences, cost of supplies for chapter meetings, social meetings, and civic projects. Then the chapter may wish to assess dues and/or conduct fund raising activities. Each fund raising activity should allow application of techniques learned in Distributive Education and must be approved by the local school administration.

CIVIC - Designed to serve the school and community, the projects can range from research projects to school beautification projects, to participation in fairs, trade shows, and other community-wide events.

SERVICE - Service activities are undertaken in many chapters to emphasize the need for sharing with others. Frequently projects are designed to coincide with Thanksgiving or Christmas such as adopting a needy family and providing gifts and contributions.

SOCIAL - Social activities are designed to provide for the well-rounded development of the student. Social functions may be combined with professional activities or be held alone through picnics, dances, early bird breakfasts, and coffees.

Believing in the importance of continuing education, National DECA, through its Board of Trustees of the DECA Foundation, Inc., has developed the DECA Scholarship Loan Awards Program. This has been made possible by gifts and contributions of interested individuals, organi-

zations, and by the Distributive Education students themselves. Quickly following National DECA, The Florida State Association of DECA organized the Florida DECA Foundation, composed of Florida business organizations, individuals, and students. This Scholarship Loan and Awards Program allows members of DECA to further their education in marketing and distribution or to prepare themselves for a teaching career in Distributive Education.

## PROGRAM PROMOTION AND EVALUATION

A well planned promotional program provides a coordinated approach in the creation of an awareness, interest, and demand for Distributive Education. The Distributive Education Program must be continually explained, promoted, and publicized to the community and the educational system for it to be successful. The promotion of the program is a never-ending process of educating and developing the attitude of the total community to one of acceptance, approval, and support of the Distributive Education Program.

### Developing An Effective Public Relations Program

Since every activity in which the teacher-coordinator participates involves some form of public relations, it becomes an interwoven part of his job. To be effective, the teacher-coordinator should plan in terms of immediate and long range goals, which will familiarize the public with the total program of work involved in Distributive Education. To assist the teacher-coordinator, a suggested calendar of activities is included in the Appendix. The calendar should be adapted, however, to meet the needs of the local community, school, and Distributive Education Program.

Like any well planned promotion, the key to success is knowing the audience or public to be reached. In Distributive Education, the list is practically inexhaustible, but the following will give specific recognition to a few groups:

Administration, Guidance Staff, and Faculty. Some of the most important targets of promotional activities are the school administrators, guidance

personnel, and fellow faculty members. They must be shown the value of, need for, and results of the program. This may be done in numerous ways. Reports of the program including number of students, earnings, hours worked, and numbers of businesses employing the Distributive Education students may be given to each member of these groups, posted on bulletin boards, published in the school paper, and sent or given to each employer. Other reports, such as the need for training and the value of the Distributive Education Program to a student who may need to earn while continuing his education in high school or junior college, should also be emphasized. Earnings and promotional possibilities in distribution and marketing need to be related to the guidance counselors.

Students. The student body must be made aware of the opportunities provided by the Distributive Education Program. Posters, window displays, pictures of present students on their jobs, and school and local newspapers are some of the media that help get the information to the students. The most effective promotion, however, is the enthusiasm of the students themselves in the program.

The Parents, Employers, and Community. People are intensely interested in what is happening in the school system. The fact that tax money supports schools creates an interest in the expenditure of these monies. The teacher-coordinator should take advantage of every media possible to inform the public of the value of the Distributive Education Program to business, the community, the school, and to the students. Some media that are most useful included: news releases, television and radio programs, talks by students and the teacher-coordinator to civic clubs, and breakfast or luncheon meetings with employers. The employer-employee banquet also serves as an important promotional medium.

To be truly effective, the teacher-coordinator must not only be convinced of the value of the Distributive Education Program, but he must make it a part of his everyday life. In every contact the teacher-coordinator makes, there is an opportunity for improving public relations. Whether in school, calling on employers or parents, in summer school, talking with other faculty members, or speaking to civic groups, there is always an opportunity to promote the Distributive Education Program.

The public relations plan will vary in different communities and from one year to the next, but it must be continuous. Each year brings new faculty members and school administrators, new students, new parents, new employers, and an ever-changing business community. Evaluation, revision, and evaluation again become of paramount importance in enhancing the public relations image of the Distributive Education Program.

## Continued Evaluation

To perpetuate and contribute to the betterment of the Distributive Education Program, the teacher-coordinator must be aware of the importance of evaluation. The Vocational Education Act of 1963 states: "Policies and procedures must insure that due consideration will be given to the results of periodic evaluation of state and local vocational education programs." Evaluative information can be used to modify and improve the program as well as to measure and publicize the achievements of the school and its graduates.

The goals and objectives of the Distributive Education Program should become the focal point in evaluation. The following statements, presented as "Evaluative Criteria", may serve as guidelines for evaluating the Distributive Education Program.

Administration

1. Policy

To guide student progress in Distributive Education in the high school institution, clearly formulated policies are needed. Policies and objectives should be designed to meet the needs of the student in obtaining and pursuing gainful employment in marketing and distribution.

( ) Are objectives reviewed periodically, or at periodical intervals?

( ) How adequate are the administrative provisions for the Distributive Education Program?

( ) Does the program receive assistance, as needed or requested, from qualified persons in the administration?

( ) Is adequate provision made for the coordination of classwork, participating experiences, and Distributive Education club activities?

( ) To what extent does the school staff and faculty understand the Distributive Education Program?

( ) What effort is being made by the school to assure the continued growth of the Distributive Education Program and to assure that it meets the educational needs of the students and the community?

2. Financial Support

The effectiveness and growth of the Distributive Education Program will be determined to a great extent by the financial support granted by the local school system.

( ) To what extent is financial support extended in maintaining an adequacy in amount and periodic replacement of equipment in relation to the number of students and areas of training served?

( ) To what extent are funds made available for expansion of staff and facilities in relation to the number of students and areas of training served?

( ) To what extent is financial support recognized in the budgetary processes of the institution?

3. Review and Development

Evaluation and subsequent changes to improve Distributive Education must be an accepted part of the institution's philosophy if quality education is to be continuously provided.

( ) To what degree is the program of evaluation organized?

( ) To what extent are recommendations in evaluative studies used to develop the curriculum?

( ) To what degree are evaluative studies recorded and reported to the administration, advisory committees, guidance counselors, and other interested parties?

( ) To what degree do business people in the community show an interest in and a desire to cooperate with the Distributive Education Program?

Instruction and Follow-Up

The Distributive Education Program consists of classroom instruction, supervised occupational experience, and DECA chapter activities designed to

prepare persons for gainful employment in the field of marketing. Emphasis is placed on the development of specific knowledge and skills necessary for successful participation in a marketing occupation.

1. Classroom Instruction

   The units of study included in the Distributive Education curriculum should provide instruction in prescribed areas of learning, whereby the student can develop the competencies demanded in the pursuit of his occupational objective.

   ( ) To what extent is the curriculum adjusted to current conditions and procedures in marketing?

   ( ) To what extent are area resources utilized in developing learning situations and standards of achievement?

   ( ) To what extent are reference books, periodicals, catalogs, and pamphlets consistent with current marketing and distribution practices?

   ( ) To what extent are individual differences considered in selecting, planning, and conducting instructional activities?

   ( ) To what degree are students developing attitudes, knowledge, and skills commensurate with the requirements of their occupational objectives?

   ( ) To what extent is periodic evaluation made to determine the degree to which students are attaining the objectives of distributive education?

2. Occupational Experience

Occupational experiences should provide direct business contact, whereby the student may personally observe and participate in the application of classroom studies in the business world.

( ) To what extent are a variety of training experiences in marketing available to students who need and can profit from such available participation?

( ) How effectively is occupational experience correlated with classroom instruction and the career objective of the student?

( ) To what extent does the occupational experience supplement and strengthen the classroom instruction?

( ) To what extent do the training and experiences offered parallel present conditions and procedures, and anticipate needs in marketing?

( ) To what degree is occupational experience provided according to a regular schedule?

3. DECA Chapter Program

The DECA Chapter Program is designed to provide additional learning experiences in all areas of competency, but especially personal and leadership development.

( ) To what extent does the local chapter participate in the activities of the state association and the national DECA Program?

( ) To what extent does the chapter program provide an opportunity for the development of leadership, responsibility, and partici-

pation in group activities?

( ) To what extent does the chapter utilize resource people in the community?

( ) To what extent does the chapter contribute to the goals of the school and those of the local community?

( ) To what extent does the club program extend the classroom instruction and occupational application?

Instructional Staff

A competent staff is one of the indispensable elements of an effective Distributive Education Program. The staff should consist of a cooperating group of individuals dedicated to common goals and objectives.

( ) How extensive is the academic preparation and occupational experience of the staff?

( ) How adequate is the staff's understanding of the educational and guidance needs of the students?

( ) To what extent does the staff keep up to date with present business conditions and resources of the area?

( ) To what extent is the staff aware of current developments in vocational education and Distributive Education?

( ) To what extent does the staff employ effective, but varied, innovative teaching methods?

Supporting Services

The high school institution provides the Distributive Education Program with supporting services which facilitate the work and aid in attainment

of the program's objectives.

( ) Institution-wide services are provided to the Distributive Education staff to the same degree of availability and effectiveness that is given other programs.

( ) The library contains reference material for studies in marketing and distribution and makes materials readily available to students.

( ) Guidance and counseling services are continuously available to students before, during, and after their enrollment in the Distributive Education Program.

The teacher-coordinator should use these criteria as a means of setting standards for the local Cooperative Distributive Education Program. Once the standards are set, the true measure of achievement can be evaluated.

The Vocational Education Act of 1963 requires that each state file a follow-up report on all Distributive Education graduates. The responsibility for this follow-up rests with the local teacher-coordinator. It is important that the teacher-coordinator keep accurate and complete records on all Distributive Education students including addresses, employment status, and career objectives. A summary of this follow-up report must be filed with the county office and the State Department of Education during the Fall of each year.

## Conditions For a Quality Program

In accepting the Cooperative Distributive Education Program as an effective approach to preparing high school students for careers in distributive businesses, certain conditions for a quality program are essential:

A qualified teacher-coordinator who has the educational background and

practical experience to provide proper meaning to the curriculum.

Student-learner with a career objective in marketing, who properly represents the school, and who will benefit from the program.

Selected training stations which will provide learning situations for the students and adequate supervision and training for the occupational experience required.

Adequate coordination time must be provided for the teacher-coordinator to bring the class, occupational experience, and DECA activities together to provide sound vocational training.

Suitable classroom facilities and instructional materials are the vital elements needed by the teacher-coordinator if the classroom instruction is to be truly effective. A field such as distribution is constantly changing and the teacher-coordinator should have the necessary equipment and materials to keep his curriculum and program up to date.

Understanding from the school, business community, and parents as to the purposes and objectives of the Cooperative Distributive Education Program is required to assure cooperation needed from all groups involved.

The final test of any educational program is if the program has met its objectives. The primary objectives of educational programs supported by public funds must be the social and economic betterment of society. A program of Distributive Education under public supervision and control can be justified only when it provides training, which enables those engaged in the distribu-

tive field to give better, more economical, and more efficient services. This social and economic benefit will be shared by distributive employees, by distributive businesses, by producers, and by consumers.

## STUDENT AGREEMENT

_____High School

DISTRIBUTIVE EDUCATION DEPARTMENT

(To be signed prior to acceptance for admission)

The Distributive Education Program is planned to develop a student academically economically, and socially. There is a responsibility to the school, the community, and to the businessmen of the community that must be considered when accepting students to this program.

To insure that each student understands the responsibilities involved, the following conditions for acceptance into the program are listed:

I agree -

School

(a) to have a medical and dental checkup by a doctor of my choice before entering the program.

(b) to obtain an age certificate to work if I am 16 or 17 years old.

(c) to obtain a Social Security Card before school begins.

(d) to present my birth certificate as proof of my age.

(e) to accept counseling and guidance from the Teacher-Coordinator cheerfully.

(f) that the Teacher-Coordinator is the recognized authority for making adjustments or changes in the occupational experience.

(g) to perform related study assignments with earnestness and sincerity.

(h) to be regular in attendance at school and on the job.

(i) to maintain a record of my income and expenditures.

(j) on days I am absent from school, I may not go to work without the specific approval of the coordinator.

(k) to be on time at school and on the job

(l) to maintain at least a "C" average in my studies.

## STUDENT AGREEMENT

(Continued)

Job

(a) to work diligently.

(b) to perform all my duties in a creditable manner.

(c) to carry out my training on the job in such a manner that I will reflect credit upon myself and the CDE Program.

(d) to represent my school well in the eyes of the community and employer.

(e) to notify my employer in advance in case of necessary absence.

(f) that I may not resign a position without permission of the Coordinator.

(g) that I may be required to work on Saturdays and during school vacation.

Chapter of DECA

(a) to participate to the fullest in all club activities in leadership development.

(b) to cooperate in all club projects and to be an active club member.

(c) to practice active citizenship.

(d) to attend the State Leadership Conference and all planned programs if chosen as a participating delegate.

(e) to attend the Employer-Employee Banquet with my employer as my guest.

(f) to pay State, National, and local DECA dues.

## EMPLOYER'S EVALUATION FORM

Name of Student _____ Training Agency _____

EXPLANATION: Please rate the student-trainee on each of the following classifications. The areas are shown with four graduations. You are asked to select the factor which most closely describes the student's performance.

It is hoped that the employer will indicate in the "comments" space any remarks which would help to further explain the rating given. This form is confidential and used to assist the individual student to better prepare himself for his career objective.

Comments on instances where performance is rated particularly high or low will be of value in making whatever adjustment is necessary.

## SUGGESTED USE OF COMPETITION TECHNIQUES IN TEACHING

| DECA Competition | UNIT OF STUDY | 1st or 2nd Year Student | SUGGESTED METHOD OR TECHNIQUE |
|---|---|---|---|
| Advertising | Merchandising | 2nd Year | Demonstration by advertising executive then allow each student to create an ad. |
| Area of Distribution Manual | Marketing Distribution in Our Economy | 1st Year | Each student select topic related to career objective. |
| Chapter of Year | Total Curriculum | All Students | Done throughout school year. Theme could be developed in Adv. Unit. |
| Creative Marketing Award | Dependent upon study undertaken | Individual or all students | Dependent upon subject. |
| Display | Display | 1st or 2nd | Can have students judge window before beginning unit and at end of unit to see growth. |
| Job Interview | Orientation | 1st or 2nd | Demonstration at end of study to indicate learning of students. |
| Merchandise Manual | Merchandising | 1st Year | Each student selects merchandise relating to on-the-job training. |
| Public Speaking | Overall Curriculum | 2nd Year | Ability to speak on feet necessary but an overall knowledge of Marketing & Distribution vital. Can select from oral presentations of mdse. manuals. |
| Sales Demonstration | Merchandising | 1st or 2nd | Demonstrations at end of sales topic with actual merchandise. |
| Student of the Year | Overall Curriculum | 2nd Year | Selection must be based on total participation and excellence during the year. |

# SUGGESTED DECA PROGRAM OF WORK

*SEPTEMBER*

Professional Meeting #1 - Invite Alumni
Prepare Local Meeting Place
Business Meeting-order DECA pins, elect officers, determine budget, plan program of work, dues
Publicity on election of officers

*OCTOBER*

Initiation Ceremony for new members
Installation Ceremony for officers
Professional Meeting-speaker on job
Interview and select contestant
Publicity on above
Follow-up graduate survey
Business Meeting-appoint committees

*NOVEMBER*

Pay State and National Dues
National DECA Week -
a. assembly program
b. radio or TV program
c. civic club appearance
Professional Meeting-Speaker on Sales select Sales Demonstration contestant
Publicity on National DECA Week

*DECEMBER*

Business Meeting to plan Christmas project
Professional Meeting-film on Parliamentary Procedure
Christmas Recreational Activity-invite Alumni
Submit story of National DECA activities to Distributor
Publicity in school paper on Christmas Project

*JANUARY*

INSTRUCTIONAL CODES AND TITLES

DISTRIBUTIVE EDUCATION
(Distribution and Marketing)

04.00 00

Distributive Education (distribution and marketing) includes various combinations of subject matter and learning experiences related to the performance of activities that direct the flow of goods and services, including their appropriate utilization, from the producer to the consumer or user. These activities include buying, selling, transportation, storage, marketing research and communications, marketing finance, and risk management.

Distributive Education is a program of occupational instruction in the field of distribution and marketing. It is designed to prepare individuals to enter, to progress, or to improve competencies in distributive occupations. Emphasis is placed on the development of attitudes, skills, and understandings related to marketing, merchandising, and management. Instruction is offered at the secondary, post-secondary, and adult education levels. Distributive occupations are found in such businesses as retail and wholesale trade; finance, insurance and real estate; services and service trades; manufacturing; transportation and utilities; and communications.

01 01 Advertising Services -- Organized subject matter and learning experiences related to the tasks performed by distributive employees and management in demand creation, planning, placement, and evaluation of sales promotion activities utilizing merchandising aids and mass media.

01 02 Apparel and Accessories -- Organized subject matter and learning expe ences related to the variety of sales, fashion, and sales-supporting tasks performed by employees and management in establishments primari engaged in selling clothing of all kinds and related articles for personal wear and adornment.

01 03 Automotive and Petroleum -- Organized subject matter and learning exp ences related to the variety of sales and sales-supporting tasks performed by employees and management in retail or wholesale establishmen engaged in the distribution of cars and trucks, automotive parts, accessories and equipment, or gasoline and petroleum products.

01 04 Finance and Credit -- Organized subject matter and learning experience related to the tasks performed by distributive employees and managemen of institutions engaged in deposit banking or closely related function extending credit in the form of loans, services allied with the exchan of securities and commodities, or consumer credit and collections.

01 05 Food Distribution -- Organized subject matter and learning experiences related to the variety of sales and sales-supporting tasks performed by employees and management in establishments primarily engaged in selling food for home preparation and consumption or selling a general or commodity line of food products at wholesale.

01 06 Food Services -- Organized subject matter and learning experiences related to the sales and merchandising tasks performed by employees and management in establishments serving prepared food and drinks for consumption on their own premises or at a place designated by the customer.

01 07 Foreign Trade (International Trade) -- Organized subject matter and learning experiences related to the tasks performed by distributive employees and management in export sales, trade controls, foreign operations and attitudes, and monetary problems and other elements in international marketing.

01 08 General Merchandise -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by retail employees and management engaged primarily in selling a variety of merchandise in department stores, junior department stores, mail-order houses, variety stores, general merchandise stores, discount stores, direct selling organizations or merchandise vending units.

01 09 Hardware, Building Materials, Farm and Garden Supplies and Equipment -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by distributive employees and management in establishments engaged primarily in selling the basic lines of hardware, lumber, building materials, supplies, and equipment for home construction, and farm and garden supplies and equipment at retail, at wholesale, or to contractors.

01 10 Home Furnishings -- Organized subject matter and learning experiences related to a variety of sales and sales-supporting tasks performed by employees and management in establishments engaged primarily in selling merchandise used in furnishing the home such as furniture, household appliances, floor coverings, draperies, and specialized lines of home furnishings.

01 11 Hotel and Lodging -- Organized subject matter and learning experiences related to the tasks performed by distributive personnel and management in establishments providing lodging or lodging and meals or other touri services on a year-round or seasonal basis to the general public or to an organization's membership.

01 12 Insurance -- Organized subject matter and learning experiences related to the tasks performed by sales and management personnel for insurance carriers of all types, or by agents representing carriers and brokers dealing in the sale or placement of insurance contracts with carriers.

01 13 Management (General/Miscellaneous) -- Organized subject matter and learning experiences related to the tasks performed by owners, proprietors, and managers in organizing and operating a business enterprise, usually a retail or service trade firm, a wholesale firm, or an unincorporated business.

01 14 Marketing (General) -- Organized subject matter and learning experiences related to the tasks performed by employees and management respon sible for demand creation and a constant flow of goods and services to consumers and users at the rate of production.

01 15 Mid-Management -- Organized subject matter and learning experiences related to the tasks performed by personnel who serve primarily in a liaison capacity between employees and management and have responsibility for the supervision of products and/or people.

01 16 Real Estate -- Organized subject matter and learning experiences related to the sales, appraisal, and management tasks performed by real estate operators and owners and leasors of real property, as well

as buyers, sellers, developers, agents, and brokers.

01 17 Retailing (General/Miscellaneous) NEC -- Organized subject matter and learning experiences --not listed or classifiable in other major categories--related to the sales and sales-supporting tasks performed by employees and management of establishments engaged in selling merchandise purchased for resale to customers for personal, household, or farm use.

01 18 Transportation -- Organized subject matter and learning experiences related to the physical distribution and the sales, storage and management tasks performed in enterprises engaging in passenger and freight transportation, public warehousing, and services incidental to transportation.

01 19 Wholesaling (General/Miscellaneous) NEC -- Organized subject matter and learning experiences--not listed or classifiable in other major categories--related to the sales and sales-supporting tasks performed by employees and management of places of business engaged primarily in selling goods to retailers, to industrial, commercial, institutional, or professional users, or bringing buyer and seller together.

01 99 Other Instructional Programs (Specify) -- Include here other organized subject matter content and learning experiences, not listed or classifiable above, emphasized in marketing functions performed by employees and/or managers of establishments engaged in selling products or providing services to individuals and business establishments.

Planning Facilities for Vocational Agriculture Departments in Ohio Schools.

Ohio State Dept. of Education, Columbus. Agricultural Education Service
MF AVAILABLE IN VT-ERIC SET.
Ohio Vocational Agriculture, Instructional Materials Service, The Ohio State University, 2120 Fyffe Road, Columbus, Ohio 43210 ($.75).
Pub Date - Mar68 17p.

*FACILITY GUIDELINES; *VOCATIONAL AGRICULTURE; *EDUCATIONAL FACILITIES; HIGH SCHOOLS; *SCHOOL PLANNING; SCHOOL SPACE

Information on planning vocational agriculture facilities is presented for use by vocational agriculture teachers, school administrators, boards of education, and school architects. It was developed by a teacher educator, state supervisor, and a committee of teachers. Major sections are (1) Recommendations for Vocational Agriculture Facilities which discusses site, classroom, and office-conference area, (2) The Agricultural Mechanics Laboratory which discusses considerations such as areas of work, size, location, construction, tool placement, lighting, plumbing, and electrical equipment, and (3) Horticulture Laboratory which covers the greenhouse and lath house requirements. Floor plans, line drawings, and phototgraphs illustrate specific details. (WB)

# FOREWORD

# AND

# ACKNOWLEDGEMENTS

This publication is designed to provide assistance to school administrators, boards of education and school architects in planning satisfactory facilities for departments of vocational agriculture in Ohio high schools. Architects and other planning local school building programs should consult with local vocational agriculture teachers and the State Staff in Vocational Education in Agriculture in planning class, laboratory, storage and shop space to meet the needs of individual school districts.

Adequate facilities are necessary for comprehensive local programs of vocational agriculture which includes organized instruction for high school students, young and adult farmers and training for other adults gainfully employed in agriculture. Increased agricultural mechanization has emphasized the need for a broad program of agricultural mechanics instruction which is an integral part of the local program of vocational agriculture. The shop facilities should be planned for the type of agricultural equipment and mechanics instruction needed in the community.

This publication has been prepared by joint efforts of teachers, teacher educators and State Supervisors in Agricultural Education with the help of architects. Copies of this publication may be secured by contacting the State Supervisor of Agricultural Education, Division of Vocational Education, Room G-16, State Office Building, Columbus, Ohio 43215. Also available are copies of recommended instructional materials including reference books and bulletins, recommended classroom and shop equipment and supplies.

# RECOMMENDATIONS
# FOR
# VOCATIONAL AGRICULTURE FACILITIES

## INTRODUCTION

Effective programs of vocational-agriculture depend upon upon both competent instructors and adequate teaching facilities. The Vocational Act of 1963 made provision for expanded activities in Vocational Agriculture to include not only farming but other occupations requiring knowledge and skills in Agriculture. Some Instructors are teaching specialized semester units in Agricultural Mechanics such as agricultural power and machinery, metalworking; others, vocational horticulture; some have occupational experience programs in the agri-business phase for farm machinery dealerships, farm elevators, feed seed and fertilizer businesses and nursery and garden store occupations. Thus although the number of farmers is declining, the percentage of persons involved in agriculture remains about the same. Therefore, the occupational need for persons with the education that vocational agriculture instruction provides continues and is greater than ever.

Considerations for a department of vocational agriculture should include a convenient site, sufficient classroom size, a conference room, well equipped shop, provisions for storage of equipment and supplies, student lockers and well planned building utilities.

These recommendations are designed to provide suggestions to school administrators, boards of education, and school architects in planning satisfactory facilities in a high school. Architects should consult with the local teachers of vocational and state agriculture supervisory staff in planning department classrooms and shops to meet needs of individual communities.

Persons planning facilities should consider future expansion and development of the school, particularly as it may affect the program of vocational-agriculture. Departments which anticipate total enrollments exceeding 45 students should consider the possibility of a multiple teacher unit. Provisions for additions and expansion must be a part of original plans. The consideration of a second classroom should be made in buildings where added classroom space is not available near the department facilities.

## SITE

The classroom and shop for vocational-agriculture should be a part of an existing high school building but may be an addition or a separate structure. Both rooms should be planned with outside entrances which give access to the department without use of other parts of the school plant. This is especially desirable for evening meetings and provides economies in heating and utilities.

The shop should be located so that large farm equipment can be easily moved in and out. An adjacent, hard-surfaced, fenced-in area of 3000 square feet with 500 square feet or more covered with a roof which will permit space for both outside mechanics work and storage. The location of the shop should be such that temporary outside storage does not detract from the appearance of the school building.

## THE CLASSROOM

### A. LOCATION

The classroom for vocational agriculture should be a part of the main school building and also have a separate outside entrance. The outside entrance is essential for use of the room during out-of-school hours for adult and young farmer programs. The shop, classrooms and conference rooms should be adjacent and separated by glass view panels to permit student supervision in all three rooms.

**Figure 1. The U-Shaped conference arrangement is preferred by Vocational Agriculture teachers. Wide tables provide adequate space for loose-leaf notebooks and reference materials.**

**Figure 2. A personnel size door adjoining the large overhead door conserves heat. Outdoor lighting is helpful for adult and young farm. . meeting.**

## B. FLOOR SPACE

A minimum of 35 square feet of classroom floor space should be provided for each student in the largest class. The minimum size should be 750 square feet with about 900 square feet for large adult classes and FFA meetings. A resilient floor covering is essential.

## C. CONSTRUCTION

Placement of doors and windows in the classroom should provide maximum wall and chalkboard space. A minimum of 30 lineal feet of chalkboard and 50 square feet of tackboard should be provided.

**Figure 3. A surfaced area outside the shop provides additional storage but should be enclosed with 8' climb proof fence for better security. The nine light overhead door provides an entrance to a spray point room which is separate from the shop for better safety.**

**Figure 4. Locating the conference room and office between the classroom and shop helps provide a sound barrier and makes it easier for the teacher to supervise activities in both rooms at the same time.**

The classroom should be decorated with warm colors if the room faces north or east and with cool colors for rooms facing south and west. An acoustical tile ceiling is highly desirable.

## D. UTILITIES

Separate heating units or individual controls for the vocational-agriculture classroom and shop are necessary if the central system will provide heat because the rooms will be used during hours when the rest of the school is not in session.

Artificial lighting should provide a minimum of 75 foot candles on the table tops of student work areas. Convenience outlets should be installed on each wall.

**Figure 5. A minimum of 20 lineal feet of chalkboard is needed in the classroom with chairs and tables that are sturdy. At least 35 square feet of classroom floor space per boy in the largest class is necessary.**

Since the facilities are to be used the year around, central air conditioning should be installed to insure year around comfort.

### E. STORAGE

Adequate storage space for apparatus equipment, supplies, charts, specimens and models and trophies should be provided in cupboards and drawers. Enclosed storage cabinets are preferred. A minimum cabinet area would be 12' long, 8' high and 18" deep. Shelves and cases should be constructed for books, reference materials, department library bulletins, magazines, other publication and teaching materials. Storage should also be provided for student notebooks, supplies and equipment. This storage area should be a compartment type. 20 students may have individual storage area approximately 4" x 12" x 14".

### F. EQUIPMENT

Classroom tables should allow 2½ lineal feet per student in the largest class to allow the use of notebooks and occupational experience record books. Tables 2½ x 5 or 2½ x 8 feet with durable wood or plastic tops are satisfactory.

Chairs should be of solid wood or metal (non folding) to accommodate the largest anticipated enrollment in high school and adult classes.

A lecture podium should be supplied the teacher station.

A standard classroom desk and chair should be supplied in both the classroom and the office-conference room. Legal size filing cabinets can be used for filing bulletins and other pamphlets.

A projection screen 6 x 6 feet should be placed above the chalkboard to permit use of visual aids in teaching. Provisions must be made for daytime darkening of the room for use of projection equipment.

**Figure 6. Enclosed classroom storage, except for trophies, help the teacher have neater storage. There never seems to be enough storage.**

**Figure 7. If coffin-type storage is used for bulletins, a narrow section easy to reach across at waist height is preferred. Larger publications can be stored below or in filing cabinet drawers.**

### G. MULTIPLE CLASSROOMS

Departments with potential enrollments in a regular or special area of vocational agriculture exceeding one approved unit of instruction justify multiple classrooms. The second or more rooms should be conveniently located to other departmental facilities, reference materials, library and teaching aids. Planning for multiple room departments should follow general recommended items outlined for single room units. The minimum size should be 600 square feet for the additional classrooms.

## OFFICE-CONFERENCE AREA

### A. LOCATION-CONSTRUCTION

An office-conference room should be planned adjacent to the classroom and shop. It should contain a minimum of 200 square feet of floor space in a single teacher department with 50 square feet added with each additional teacher unit.

**Figure 8. This pull-out slide provides easy access to charts but at best two of these are needed.**

Glazed partitions should be constructed between the conference room, classrooms and shop. This enables teachers to supervise students in both rooms simultaneously Doors should open into both classroom and shop from the conference room.

### B. EQUIPMENT

The conference room should be equipped with an office desk, chair and standard drawer filing cabinets per teacher. At least 70 lineal feet of shelf space for reference materials should also be included. Cabinets and cupboards for storage of teaching materials and supplies should be considered in planning and equipping the room.

Phone service should be furnished to the teachers in the office-conference area because this room serves as an office and headquarters for the instructors and often is in use for adult classes, conferences, and committee meetings when the rest of the school is not in session. Additional facilities and equipment should be added in multiple teacher unit departments.

**Figure 9. The conference room can provide office space for teachers. View panels help in supervising classroom and shop activities. A telephone near the teacher's desk is essential for contacting students and farmers during out-of-school hours.**

# AGRICULTURAL MECHANICS LABORATORY

## CHARACTERISTICS OF AGRICULTURAL MECHANICS INSTRUCTION AS RELATED TO FACILITY NEEDS

National Leaders in Agricultural Education and Agricultural Engineering have identified five areas of instruction essential to effective teaching of agricultural mechanics. They are 1) *Farm Power and Machinery,* 2) *Farm Buildings and Conveniences,* 3) *Soil and Water Management,* 4) *Rural Electrification and Processing,* 5) *Agricultural Construction and Maintenance.* In Ohio, teachers of vocational agriculture have devoted 25 to 40 percent of their high school teaching to this phase but the national committee suggests 40 to 60 percent because of the increasing mechanization of agriculture and the large capital outlay invested in farm machinery buildings and equipment.

### A. AREAS OF WORK

The agricultural mechanics laboratory should be planned to provide work areas associated with instruction in each of these five subject matter areas.

1. FARM POWER AND MACHINERY

Instruction in this area should be planned to help students understand the basic principles of power and machinery in order that tractors and implements will perform efficiently and economically, thus protecting the large investment. This unit should help students through supervised instruction to develop the necessary abilities for proper operation, maintenance and management of farm engines and machinery. The usual sub areas are:

a. principles of two and four cycle gasoline and/or diesel engines
b. fuels and fuel systems
c. ignition systems
d. power transmission, belts, gears, hydraulic, etc.
e. cooling systems
f. lighting systems
g. lubrication
h. tillage tools – plows, disks, cultivators, planters, etc.
i. cutting and harvesting equipment – mowers, balers, combines, picker-shellers, spraying equipment, etc.
j. the use of the dynamometers and steam cleaners.

2. FARM BUILDINGS AND CONVENIENCES

Modern systems of growing livestock which often includes confined housing of poultry, hogs, dairy cattle, beef cattle, etc. Pushbutton feeding and processing of farm products require a basic understanding of the principles involved in materials handling, drying and ventilation for effective planning when remodeling and constructing modern farm buildings and conveniences. Units of instruction should include

a. understanding of drawings and plans and sketching modifications of plans and/or drawings for farmstead layouts, planning buildings for future needs
b. planning and constructing waste disposal and sanitation systems
c. planning grain and feed handling and drying systems
d. preparing bills of material and choosing construction materials
e. the development of facilities for instruction in horticulture, especially that involving greenhouses, requires many of the same principles as for confined housing of livestock.

Figure 10. Floor Plan # 1

Figure 11. Floor Plan # 2

Laboratory instruction provides learning for students when they use various building materials and learn means of assembling with the use of construction power tools and equipment.

3. SOIL AND WATER MANAGEMENT

The principles of the conservation of soil and water, water quality, waste disposal, etc. will have less need for shop laboratory facilities than other areas of instruction except for maintenance and servicing of equipment. The units of instruction are

a. planning, installing, and maintaining draining and water collecting systems, such as tiles, terraces, farm ponds, pumps, lagoons

b. irrigation

c. use of the farm level for laying out systems and drawing maps

d. relation of tillage equipment and slope of land to soil erosion control.

4. RURAL ELECTRIFICATION AND PROCESSING

With the increased mechanization of the farmstead buildings feed lots, etc. it is more essential than ever before for farmers and agricultural workers to understand the principles involved in the use of electric energy to provide power, heat, light and automatic controls in the complex operation of modern farm systems of materials handling and processing.

Units of instruction should include

a. understanding the basic terminology of electricity and its application to each power use.

b. planning wiring systems for adequacy convenience and safety.

c. selecting and using lighting equipment.

d. selecting motors, controls, equipment and appliances.

e. maintenance service and repair of electrical systems and equipment.

f. installation of power, lighting, heating, cooling systems.

5. AGRICULTURAL CONSTRUCTION AND MAINTENANCE (AGRICULTURAL SHOP WORK)

In order to make efficient use of the large investment in tractors, machinery, equipment, electric devices, etc. it is important to develop an organized program of maintenance and servicing of these items.

Units of instruction should include

a. development of the home farm shop as a service center.

b. select and safely use hand and power tools and equipment.

c. sharpen, repair, maintain and use common shop tools and equipment.

d. electric arc and oxy-acetylene welding.

e. hot metal work in shaping, bending, and heat treating especially as related to welding processes.

f. cold metal work such as cutting, drilling, filing, tapping, threading, riveting and bending.

g. sheet metal work including cutting, bending and fastening.

h. pipe and tubing and simple plumbing or repairs.

i. select lumber, metal, hardware, and building materials and calculate costs of materials.

j. construct small buildings and equipment consistent with learning experiences (rather than service).

k. select and apply paint, preservatives and other finish materials appropriate to the projects.

l. concrete and masonry work including building forms, preparing mixes or calculating costs for ready mix, placing finishing and curing concrete. Laying concrete blocks or other masonry materials.

m. safety as related to recognizing dangers and hazards associated with using tools and equipment.

The complexity of modern agriculture requires the inclusion of all five of the areas of instruction previously described. The extent of instruction will be determined by the abilities and needs of the students both high school, young farmers and adults. When the teaching is organized around these five units with emphasis on applied scientific principles and concepts related to agricultural systems, learning will be more permanent, requiring less retraining. The curriculum should be planned so that blocks of time are assigned to laboratory shop activities according to the particular unit or units being taught. The unit approach to teaching agricultural mechanics makes for better planning and provides for more efficient use of facilities and equipment.

The rooms, equipment and facilities needed to carry out an effective program of vocational agriculture including agricultural mechanics differ considerably from those of other areas of secondary education. In addition to the high school students the needs of young farmers, adult farmers and sometimes other special interest groups make it necessary to provide heat, light and other facilities for educational programs in the evenings and on week-ends, summer and often during periods when high schools are not in session. Thus it is important to provide heating, lighting, toilet facilities, telephone service, etc. for these times when the remainder of the school building is not in use. Some of these activities will involve both men and women, thus toilet facilities for both men and women should be available. It is essential to furnish a laboratory shop area of sufficient size, free of columns and posts and so arranged with large areas of unobstructed floor space, high ceilings and a large door that will accommodate the movement into, within and out of the shop, the large equipment used in modern agriculture.

The planning should be based on the units of instruction to be taught with anticipation of future needs. Many vocational agriculture teachers believe it is desirable to have a land laboratory as a part of the school property so that plows, combines and other farm equipment which has been serviced or repaired in the shop can be field tested with minimum of wasted time. Enclosed storage and a work area outside or nearby the large shop door is desirable so that heated space can be more efficiently used. If vocational horticulture is a part of the plan then greenhouses, a head house, a lath house and land for growing horticultural plants will be needed.

## B. LOCATION OF LABORATORY

The laboratory shop is most ideally located when directly adjacent to both class and conference rooms. This provides easy access for students and permits better

supervision by the instructor. Glass view panels between the shop and other department rooms are desirable in wall construction because teachers frequently will be teaching in the classroom and supervising other students in the office-conference room and/or shop. It is important that the vocational agriculture classrooms and shop be so located that shop noises both inside and outside the shop will not disturb other classes and that music classes and other noisy departments will not disturb the agriculture classes. The placing of the office-conference room, locker room, storage rooms, etc. between the classroom and shop serves as a sound barrier to reduce shop noise in the classroom especially in multiple teacher departments where both are in use at the same time.

An overhead type of outside door with a minimum size of 14' high by 16' wide will be large enough for most large farm machinery and equipment and movable buildings constructed in class. A small personnel door adjoining the large overhead door is desirable for safety in case of emergency and to prevent heat loss which results from opening the large door to enter or leave the shop (when a personnel door is not provided).

Space for a level surfaced entrance apron at least 10' x 12' (with an area drain) outside the large shop door with access to a street is needed for easy entrance and for instruction, service or maintenance and repair of machines too large to bring into the shop or for supplemental work space.

Provision must be made for storage of unfinished projects for which parts or materials may not be immediately available. Such projects and some materials, supplies, and tools can be stored in an outside gravel or paved area if it has a 16' gate and fenced in to prevent pilfering. The area should have a roof about 20 feet wide across one end of the lot adjoining the building to furnish protection to some projects and materials. A loading ramp for moving farm equipment onto and off of a truck is a great convenience.

Power supply of 240 volts for an arc welder and 120 volts for a steam cleaner, compressed air and running water are desirable at the outside area near the large door.

## C. SIZE OF LABORATORY

The shop should provide a minimum of 100 square feet of floor space for each student in the largest mechanics class. The over-all size should be a minimum of 2000 square feet. Departments with multiple classrooms for vocational agriculture should allow an additional 10 square feet of shop floor space for each class exceeding three. For example, if five class groups use the shop, 120 square feet per student in the largest class should be allotted because of the need for storage of more incomplete projects.

The suggested minimum width of room is 36 feet with a width to length ratio not to exceed 1½ to 2. A long narrow facility or one that is square or that is not a clear rectangular walled space (that is, no hidden corners or projections of other rooms into the shop space) is generally inconvenient and makes teaching and supervision difficult. A ceiling no lower than 18 feet is desirable for moving machinery through 16' high door and for access to the top of tall machinery and for putting roof on movable buildings. (One combine harvester is 13'6" high, 28'6" long and 13'6" wide at the front).

Minimum suggested size for shops in schools are as follows:

30 students ..... 2000 square feet
45 students ..... 2600 square feet
60 students ..... 3200 square feet

When Industrial Arts and Vocational Agriculture share shop facilities, the amount of space should be doubled, with a minimum of 200 square feet per boy in the largest class. There is usually a difference in educational objectives between Industrial Arts and Vocational Agriculture so that shared shops are not desirable. Industrial Arts students are making furniture while Vocational Agriculture do rough carpenter work. Industrial Arts uses work stations with their power tools in fixed locations over the entire floor space, constructing small projects, while Vocational Agriculture needs the floor space unobstructed and flexible for large projects such as tractors and cattle feed bunks. It is difficult for two teachers to teach in the same shop at the same time especially if one teacher is trying to discuss a unit and demonstrate while a student of the other teacher is operating a power saw or planer in another part of the shop. If enough space must be provided for both programs then a separation of space by a wall is desirable, especially if both Industrial Arts and Vocational Agriculture students are in the shop during the same class period.

## D. USE OF SPACE

Careful planning and arrangement of power equipment provide for a more functional design and encourage more efficient work and better supervision in the shop laboratory. The shop should be divided into work areas and yet the space should be flexible so that even items of large power equipment can be moved if the space is needed for a

**Figure 12 Shops should be planned with specified areas for each type of work. Other metalwork or the machinery maintenance area should separate hot metalwork from wood construction. This shop does not have enough welding work space or adequate exhaust capacity.**

**Figure 13. Students and instructors work better with clean shop clothing. Projects should be of such scope and usefulness that a student constantly is challenged to learn new skills.**

different activity. The work areas such as carpentry, welding, machinery repair, tractor and small engine maintenance and repair, electric wiring plumbing, painting and cleaning, sheet metal and soldering, hot metal (shaping, bending, heat treating) need to be assigned a specific part of the shop. The welding area generally is best located near the large door so there is easy access for repair of large machines. Fire resistant welding curtains are preferred to masonry walls to provide eye protection between arc welders because curtains allow the space to be flexible. Space for four arc welding booths and one or more oxy-acetylene welders is needed. An exhaust system is necessary and is discussed in the section on ventilation.

A separate paint room is desirable for safety and should have enough space for the students to move around a tractor or other piece of equipment for ease in painting. The same room can be used for cleaning the machine before painting and thus helps prevent steam condensation and collection of dirt on the walls in the entire shop area. The painting and cleaning area should be located near the large

**Figure 14. Many teachers like to store tools common to a work area above the workbenches. Every tool should have a silhoutte so that proper storage helps the teacher account for each tool every day.**

**Figure 15. Students should be protected from harmful arc rays with adequate clothing and eye protection and curtains to minimize stray arcs. A large capacity drill press and a power hacksaw are necessary if quality metalwork is done.**

door even though it is a separate room. There should be a personnel door connecting the paint room to the main shop area. A paint room requires its own separate exhaust system vapor proof switches, lights, motors, etc., compressed air of adequate capacity for two spray guns and adequate heating to replace the exhaust air. A steam cleaner should be provided to do steam cleaning at this area. A portable unit is desirable so it may be used in other locations.

The power and machinery maintenance area also is best located near the large entrance door so that the implements or tractors can be readily moved in or out from the outside area if the space is needed. An overhead exhaust system to remove fumes from tractors and small engines is needed especially when a dynamometer is in use. A floor drain is needed in this area because some dynamometers are water cooled and machines sometimes must be cleaned.

**Figure 16. Shops with large enrollments will find two saws desirable. A radial arm saw (primarily used for cut-off) and a table saw (primarily used for ripping) so that students do not waste time waiting to use the saw.**

Hot and cold metal work areas should be located near the welding area so that tools (such as the floor drill and the power hacksaw) and work operations common to both are near at hand. The sheet metal area and the plumbing area can be located adjoining the cold metal area.

The wood construction work area used in farm carpentry is generally located at the end of the shop farthest away from the large entrance door and the welding area in order to minimize fire hazards and because wood construction projects are not easy to move and often remain in shop for relatively long periods of time.

## E. PLACEMENT OF POWER TOOLS*

Radial arm saws generally are best located in the wood area along an outside wall and should have extension tables. The planer and jointer should be nearby and are sometimes arranged in a triangle to minimize the amount of floor space used by these items. A wood band saw often is located in the wood construction area along the wall but arranged so that 16 foot or longer boards can be ripped on it if necessary. A one-half horsepower size grinder for sharpening of tools is located in the woodworking area near the cold metal area but at a distance from the welding area to minimize heavy grinding on a small grinder.

If only one floor drill is purchased it should be located between the wood and metal areas so it can conveniently be used for both activities.

The power hacksaw should be located convenient to the welding and hot and cold metal work areas. A heavy duty grinder with 2" x 12" wheels and a 3 to 5 horsepower motor should be located adjoining the welding area so that veeing of metal for welding and other heavy duty grinding can be done efficiently.

The air compressor often is mounted on the wall near the ceiling to conserve floor space. Air is piped to the painting and cleaning area and to the wood area where it is used to clean sawdust from equipment. Air is also needed in the power and machinery area for cleaning parts and filling tires. Tools required for these special jobs should have cabinet storage near these work areas. Wall space for these cabinets should be provided.

Too often equipment selection and arrangement and tool supply storage are considered after the shop building is completed. In such cases wall space for cabinets may not be available, electric service often inadequate and inconvenient, and the best that can be secured is a poor compromise arrangement. Therefore it is strongly recommended that all power tools, tool cabinets, work benches, exhaust systems be shown on the architect's plans as well as the location of the electrical supply to be installed for each power tool now listed or to be added in the future.

## F. ELECTRICAL EQUIPMENT

Outlets are required for both large power tools and portable equipment. An overhead power supply of both 120 and 240 volts is preferable to floor outlets to permit flexibility in placement of power tools and use of floor space. In shops over 40 feet in width, two overhead lines may be required. All outlets should be of the grounding type for safety. Since most farm arc welders are not made in 208 volt capacity the full 240 volts should be supplied in order that the welders perform efficiently. A ten percent voltage drop, such as is in effect created with a 208 volt supply to a 230 volt welder gives about a 20 percent loss in heat output and poor welder arc striking characteristics. Power supply for 4 to 6 arc welders should be furnished.

A safety feature for major power tools may be provided by means of locking switch boxes. This enables the instructor to control safe use of such equipment. A panic button in two or three places in the shop for emergency use may be desirable.

Three-phase current, when available, is desirable for motors exceeding one-half horsepower. A single-phase, 240 volt outlet should be placed outside near the large door to permit outdoor use of portable arc welders. A 120 volt outlet also is useful for portable drills, etc.

Grounded, 120 volt outlets should be spaced every 6 to 8 feet along the wall *above the work benches* and near all special work areas reducing the need for extension cords.

## G. CONSTRUCTION

The shop floor should be of reinforced air entrained concrete, sloping one inch per hundred feet to a drain. This concrete floor should be hard surfaced to enable easy cleaning and maintenance. Drainage should be provided near or outside the overhead door by no smaller than an eight-inch outlet. A grease and dirt collecting type of sump is desirable to minimize clogging of the drain when dirt-laden tractors and farm machinery are cleaned.

Since noise is often a problem in the school shop, consideration should be given to the installation of an acoustically treated ceiling.

**Figure 17. Adequate electrical supply is necessary and should allow for future equipment. A panic button may be desirable. Farm type welders need 240 volt service rather than 208 volts.**

*A separate list of tools, equipment and supplies is available from the State Department of Education, Division of Vocational Education in Vocational Agriculture.

The overhead outside entrance door should be at least 16 feet in height and 16 feet wide and powered by an electric motor. It should open on to a surfaced apron to enable entry in unfavorable weather. A standard 3 by 7 foot door near the large overhead door entrance is also desirable to permit personnel access without opening the large door.

Windows should be placed at least 42 inches above the floor to permit work benches to be attached to the walls below window height. Triangular supports for work benches make for easy cleaning. Window ledges with a 45 degree slope, rather than level encourages good shop housekeeping.

Window spacing should permit at least 5 feet of wall space for attaching tool storage cabinets in every 20 lineal feet of shop wall. The wall cabinets are required for tool storage in project work areas.

## H. HEATING

Quick-recovery heating units are desirable to supplement regular heating utilities of the building. Such units will compensate for heat loss which is rapid when the large outside door is opened. A separate switch should be installed so that the unit can be turned off where the teacher is doing a demonstration. The unit can also be used for heating the shop area when other parts of the building are not in use. This may also reduce the need for special custodial service.

## I. LIGHTING

Artificial lighting should provide a minimum of 30 foot-candles of available light at work height in all shop areas. Spot lighting of about 50 foot-candles on the welding table top is needed in each welding booth so welds can be examined easily. The entrance to the large outside door and the adjoining smaller personnel door should be well lighted for evening meetings. Sometimes this is the main entrance to the vocational agriculture department when the remainder of the school building is closed. Switches should be installed such that the teacher can move from the shop to the classroom, etc., with at least one ceiling light controlled from each entrance.

## J. PLUMBING

In buildings where rest rooms are not located near the shop, such facilities should be provided. Adult classes, young farmer classes, and FFA activities are frequently attended by both men and women. Therefore, it is desirable that conveniently located, well lighted toilet facilities for both men and women be available. At least one stool, two urinals and a lavatory should be included in the men's toilet. Individual student lockers and space to permit changing of clothes are also convenient for shop activities and can be placed in the rest rooms or the shop area.

A large circular, or semi-circular lavatory to permit use by 4 or 5 students is essential for clean-up following shop periods. Although with some water supplies this style tends to clog readily and other designs should be considered. A drinking fountain is an aid in keeping students in the shop room.

A separate deep sink and source of water for cleaning of equipment parts – paint brushes, etc. – is also an important consideration in shop planning.

A water outlet to which a hose may be attached is needed in the cleaning area of the shop and near the large door and also outside the large door for cleaning with water or a steam cleaner. Compressed air is also useful outside the shop near the large door for blowing dirt, chaff, etc. off of machines and for filling tires.

A gas supply is needed if a gas forge (not a heat treating furnace) is installed for heating and bending of metal. The gas forge usually is located near the welding area.

## K. VENTILATION

An exhaust fan of adequate capacity is essential for removing fumes, particularly from welding and painting. It is generally desirable to remove welding fumes at the point of generation because fumes are dissipated less and heat losses are lower. Fumes should be picked up about 8" to 12" from their source. At 8" above the work, one source suggests that about 200 cubic feet per minute must be removed from each welder whereas 400 cubic feet per minute from each welder are required where a general ventilating system is used. About 100 cubic feet per minute per square foot of opening is required. At least one flexible pipe adjustable pick-up is desirable in addition to the pick-up from each booth so that welding fumes can be removed at their source when projects are being welded.

The squirrel cage type fan is less noisy than a propeller type but either will do the work if they have enough capacity.

If a hood, covering the work areas is used, the air intake ports distributed in a false ceiling or perimeter pick-up is desirable for pick-up of welding fumes.

For removal of exhaust fumes from small engines and tractors heat resistant flexible tubing with adaptors to fit various sizes and types of exhaust pipes are necessary. Since most tractors have vertical exhaust stacks overhead

**Figure 18. Fumes from welders should be picked up at the source where they are generated. At least one unit should be flexible for use on larger projects. At least 250 cubic feet of air per minute needs to be moving at the pick-up point at all welders.**

pick-up is most satisfactory. A fan of suitable design is necessary for satisfactory operation especially when using a dynamometer.

Manufacturers of spray painting equipment can provide the details for removal of fumes from painting. Paint fumes cannot be safely removed with the same system used for welding.

Dust collecting equipment is desirable at saws, planer and jointer.

## L. WORK BENCHES

A minimum of 40 lineal feet of bench space should be provided in the shop. Benches should be approximately 22 inches wide and in varying heights from 30 to 36 inches to fit short and tall boys.

Benches should be attached to the walls with diagonal legs to permit storage below and to make for easier cleaning. Metal tops should be provided for benches devoted to metal and welding work. Location of benches along outside walls gives far more efficient use of shop floor space.

A movable demonstration table, 2 by 5 feet and equipped with a metal top is a very convenient item of shop equipment. It should have both wood and metal vises and roll on 6-inch heavy duty casters but have provisions for anchoring the table.

## M. TOOL STORAGE

Cabinets for tool storage should be provided adjacent to each separate work area. Wall cabinets, spaced between windows and above work benches are most convenient for small hand tools. Special tools should be stored in cabinets convenient to the specific work area.

Movable tool carts, rolling A-frame storage racks not larger than 2' wide, 4' long and 4' high and cabinets on casters or wheels may also be used to supplement wall storage. Tool cages are *NOT recommended* because the boy assigned to checking out tools learns very little and

**Figure 19. Wall mounted workbenches make for easier cleaning and rollaway storage can utilize the space to add storage capacity.**

**Figure 20. Floor length cabinets make it easier for boys to reach tools but, probably should not be over 7' high.**

in most agricultural mechanics occupations workers do not work from a tool cage. A few specialized and expensive tools should be stored in a separate cabinet and are checked out to the student by the teacher.

## N. OTHER STORAGE

Cabinets approximately 7 feet high, 1½ feet deep and 3 feet wide provide partitioned shelf space for small power tools, welding equipment and shop supplies.

Shelf unit drawers and bins should provide ample storage for nails, screws, bolts and small parts.

## O. LUMBER AND METAL STORAGE

Lumber and metal storage should be provided preferably in a separate room adjacent to the shop. This permits better shop orderliness. Portable carts on heavy duty casters at least 4" in diameter can be used to supplement permanent storage space for materials. Such lumber and steel is often 16 or 20 feet in length and pipe 21 feet, the storage room should be at least 22 feet long and about 8' wide. Entrance doors should be full width of the space so lumber or steel can be stored flat against the side walls and easily removed. Welded pipe racks are convenient for storage with a work space about thirty inches wide about two feet from one side with side delivery storage. Sometimes this storage room can be provided near the classroom and thus additional overhead storage above the classroom is possible.

## P. TEACHING AIDS STORAGE

There is a need for storage of various teaching aids such as electrical demonstration boards, practice wiring boards, models of buildings, carburetors, generators, small engines, sample building materials and numerous other materials and devices. Overhead storage may be suitable. There never seems to be enough storage space.

## Q. SAFETY

A clean shop is a safer place in which to teach and learn.

1. COLOR SAFETY

A standard color safety system should be applied to all shop power tools, electrical panels, benches, equipment and walls to encourage safe use of shop facilities and to make for easier, more effective teaching.

2. FIRE SAFETY

Fire extinguishers of the size, number and type according to current fire prevention codes should be provided and located as recommended by authorities. A parts cleaning cabinet for use with special low combustibility cleaning fluids is needed in the engine maintenance.

3. FIRST AID AREA

A large first-aid kit supplied with materials for cuts, burns and eye injuries should be provided. The standard color safety code recommends a safety green color for the cabinet with a white cross.

4. ELECTRIC TOOLS

A grounding wire should be connected to the frame of all electric power tool motors, lights and other devices. All portable 120 volt power tools must be used with permanently installed grounding wire (green wire) cords for connection to standard three point grounding outlets.

# HORTICULTURE LABORATORY

## A. GREENHOUSE

In certain communities where strong emphasis is given to plant science and horticulture, consideration should be given to including greenhouses. The extent of the instructional program and the expected student enrollment or cooperative use with other departments of the school will determine the size and types of greenhouses to be constructed. The greenhouse complex should be directly connected to the classroom so that plants and materials can be moved from the greenhouse to classroom without going outside.

1. SPECIFICATIONS

a. Type – If the instructional program is to be meaningful and truly vocational, a greenhouse laboratory complex with a minimum of 2,000 square feet in the greenhouse and 1600 square feet in the laboratory (nead house) area, which is connected to the greenhouse structure, should be provided. Greenhouse operators refer to the work area adjoining the greenhouse as the "head house". For student instruction a larger "head house" will be needed than is used by commercial operators so that groups of students can work at several activities at once. There is a need for storage of tools and supplies, soil bins, fertilizer, sand bins, and other materials needed in growing greenhouse and other horticultural plants. It is recommended that the greenhouse be built on a southern exposure and contain a minimum of three specialized environmentally controlled growing areas. Both structures should incorporate the features included in sample designs available through the State Department of Education's Agricultural Education Service. When the total enrollment in horticulture courses exceeds forty-five students it is recommended that additional square footage allocations of 50 square feet per student be provided in greenhouse facilities and 20 square feet per student in laboratory (head house) space.

2. CONSTRUCTION MATERIALS

Standard commercial type aluminum houses erected on standard concrete bases are desirable with glass covering. Although plastics make an inexpensive first cost covering, it generally must be replaced annually and thus is likely more expensive than glass over a long period of time.

3. EQUIPMENT AND UTILITIES

Since greenhouse operations continue 24 hours a day every day, night, holiday and week-end during the season for the particular crops grown, water, heat, light, steam, and electric power must be available at all times and an operator available in case of emergency power failure to start up the standby electrical equipment.

The school's heating plant may be connected to the greenhouse but a supplementary source of heat should be available in the event that the main plant's heating system is shut down. Hot water or steam heat is preferred and all heating should be automatically controlled by thermostats in the greenhouses. Large amounts of steam are needed for soil sterilization. Automatic ventilation must be provided with ridge ventilation and exhaust fans. The greenhouse must also be equipped with humidifiers, controlled by humidistats as used in standard commercial greenhouse operations.

A minimum size of 1¼ inch water main is necessary with ¾ inch line providing water at various points within house.

The electrical service entrance box should be at least 60 ampere capacity to supply power for

–electric soil sterilizers
–propagation heat cables
–soil shredders
–automatic water systems
–ventilation fans
–humidifiers, etc.

Adequate lighting also automatically controlled according to the needs of the crops must be provided in addition to the general lighting needed for night work. Waterproof convenience outlets should be provided at 20 foot intervals around the walls to allow for use of equipment such as lamps for forced plant growth.

## B. LATH HOUSE

For certain types of plants a lath house provides needed growing conditions and is essential to the horticultural activities. The size is dependent upon the teaching units but a minimum of 10' x 30' is recommended.

A LATH HOUSE IS ESSENTIAL TO PROVIDE MODIFIED SHADE FOR PROPAGATING AND GROWING MANY KINDS OF HORTICULTURAL PLANTS

GOOD INSTRUCTION BEGINS IN THE VOCATIONAL HORTICULTURE CLASSROOM.

THE HEAD HOUSE AREA SHOULD ADJOIN THE GREENHOUSE AND PROVIDE SPACE FOR PLANT PROPAGATION, POTTING OF PLANTS, FLOWER ARRANGING, STORAGE OF TOOLS AND SUPPLIES AND OTHER ACTIVITIES ESSENTIAL TO GROWING GREENHOUSE PLANTS.

A MINIMUM OF THREE SEPARATE ENVIRONMENTALLY CONTROLLED SPECIALIZED GROWING AREAS ARE ESSENTIAL TO TEACHING VOCATIONAL HORTICULTURE BECAUSE OF THE GROWTH REQUIREMENTS FOR DIFFERENT GROUPS OF PLANTS.

NEW YORK

Activities of the Research Coordinating Unit staff on committees and conferences include: (1) presentation at superintendents' conference of research, dissemination, and services of the Bureau of Occupational Education Research Association convention in Chicago, (3) attendance at National Conference on the Diffusion of Education Ideas in Michigan, (4) sponsorship of the Northeastern States Research Coordinating Units Conference with representation from eight states, (5) presentation at conference on Home Economics Occupational Education for the New York State Bureau of Home Economics, and (6) participation as a committee member and consultant of a Job Fair for Albany area. Other activities include progress on nine on-going projects and development of four proposed projects. Dissemination activities have expanded with the dissemination of research projects from ERIC and the development of a monthly newsletter to serve as a dissemination vehicle. (MM)

## INTERSTATE AND INTRASTATE CONSULTATIVE SERVICES

1. Dr. Ann Martin of the University of Pittsburgh is involved in the development of a proposal to be submitted to the U.S. Office of Education. The proposal deals with the design and implementation of a system to broaden the vocational guidance program in the secondary schools through the use of the multi-media approach.

2. Two staff members visited the Ulster County Community College and the Agricultural and Technical College at Farmingdale to explore possible areas for research related to training for social service careers. The community service assistant programs at these two institutions were examined.

## INTERAGENCY DEMONSTRATIONS

1. A staff member attended a demonstration in the New York State Education Department of computer processes from programming to printout with an explanation of data storage and other services.

2. A staff member observed a teach-in demonstration of the Collegiate Vocational Education Training Project (COVET) at Manhattan Community College, City University of New York as part of an orientation program for college entrance of economically and culturally disadvantaged high school juniors in Manhattan.

COMMITTEE AND CONFERENCE ATTENDANCE AND SPEAKING ENGAGEMENTS

1. A project manager made a presentation of research, dissemination, and services of the Bureau of Occupational Education Research to professional staff at a superintendent's conference at Farmingdale.

2. A staff member went to the American Education Research Association convention in Chicago. A wide variety of meetings were available, numerous papers were heard, and research ideas were shared.

3. A staff member attended the National Conference on the Diffusion of Educational Ideas sponsored by the Research Coordinating Division of the Michigan Department of Education in cooperation with the U.S. Office of Education. The conference was held at the Kellogg Center for Continuing Education, Michigan State University on March 26, 27 and 28, 1968.

4. This unit sponsored the Northeastern States Research Coordinating Units Conference on February 27 and 28, 1968.

   The state RCUs represented included Connecticut, Delaware, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, and Rhode Island. The guest speakers and their respective topics are listed below:

   Albert L. Alford, Assistant Commissioner for Legislation, Office of Legislation, U.S. Office of Education, "Federal Legislation and Its Implication for Research."

   Duane Nielsen, Organization and Administration Studies Branch, Department of HEW, U.S. Office of Education, "The Relationships of the USOE to the RCUs."

   Sam D. Sieber, Program Director, Education Office, Bureau of Applied Social Research, Columbia University, "The Organization of Educational Research--Development and Maintenance of Research Units."

   Robert H. Burnham, Senior Research Technologist, Research Laboratory, Eastman Kodak Company, "The Man-Machine Interface in Information Systems."

   Henrietta Fleck, Chairman, Home Economics Department, New York University, "Method of Conducting Research and Criteria for Judging Research."

Martin Hamburger, Head, Division of Vocational Education and Applied Arts and Sciences, New York University, "The Role of the University in Occupational Education."

Harold Fezer, Director, RCA Institutes, "How Can Occupational Research Bridge the Gap Between Industry and Education?"

Letters have been sent to conference participants in reference to their reaction to the conference. A summary will be made of their statements for use in future conferences. If this summary is deemed appropriate and useful, it will be disseminated among the conferees.

5. A staff member participated in a symposium at the conference on Home Economics Occupational Education under the direction of the New York State Bureau of Home Economics. The staff member made a presentation entitled "The Role of Competent Teachers in Quality Home Economics Occupational Education Programs" before approximately 75 teachers and supervisors connected with the statewide program.

6. A staff member participated as committee member and consultant for the planning of a Job Fair for the Albany area. Area public and private agencies sponsored a Job Fair designed to introduce noncollege bound youth to employers for job placement after graduation.

   The Bureau of Occupational Education Research will direct a study to evaluate the Job Fair's effectiveness.

7. A second general conference to determine guidelines for revision of the Business Education curriculum in New York State will meet on April 22, 1968, at the State University of New York at Albany. A report of the progress accomplished by general conference and committee members will be distributed and reviewed at the April meeting.

## PROGRESS AND DEVELOPMENT OF INTERNAL PROJECTS

1. Preliminary investigation was made into the possibility of establishing a teacher aide program at the community college level. A brief review of the literature was made and a bibliography collected.

2. Approval was obtained from the school district superintendents participating in the follow-up study of all seniors enrolled in vocational education programs. Introductory letters and blank roster forms were sent to the guidance personnel of all participating schools.

3. A nationwide survey of the Health occupations at the secondary level is being readied. To date, 30 of the 44 RCUs have reported.

4. A questionnaire designed to elicit perceptions of the administrators of Vocational-Technical Education at the state level was administered to Associates and Supervisors in State service (middle management) in Occupational Education. The results will be analyzed and published.

5. A proposal to help better disseminate research is being developed. Further information concerning this project will be available in the next quarterly report.

6. A staff member visited five high schools and examined school records in connection with the "Marketable Skills" project for low achieving high school graduates.

   Preparation of the survey instruments and the selecting of the sample are now in the preliminary phase for the above study. Names, addresses and telephone numbers of 1967 graduates are now being compiled in each of the participating school systems.

7. A staff member engaged in the review of current research in simulation (gaming) techniques as a possible area for research in the area of vocational decision making.

8. A bulletin, "Area Occupational Education Programs in New York State, 1967-68" is being readied for publication. This publication will be a statement of the status quo of these programs and will include data on enrollment, component districts, pertinent legislation, professional personnel and other information.

9. A special committee report for program development in automatic business data processing in New York State secondary schools has been reviewed and revised several times. The report is in the hands of a syllabus committee.

## ON-GOING 4(a) PROJECTS

The following projects have been approved as noted in previous reports and are currently in progress:

ESTABLISHMENT OF A UNIT TO PREPARE OCCUPATIONAL GUIDES, BOCES 1, Nassau County.

EVALUATION OF PROGRAM FOR PERSONS WITH SPECIAL NEEDS, Syracuse City School District.

EVALUATION OF THE OBJECTIVES OF THE FOREMAN AREA EDUCATION CENTER, BOCES 1, Monroe County.

PLANNING OF AN EXPERIMENTAL EDUCATION PROGRAM IN COMPUTER AIDED PRODUCTION OF ELECTRONIC CIRCUITRY AND SYSTEMS, Department of Electrical Engineering, New York University.

GUIDED OCCUPATIONAL TRAINING: A VOCATIONAL WORK EXPERIENCE PROGRAM FOR INTELLECTUALLY LIMITED AND EDUCATIONALLY HANDICAPPED STUDENTS, Oceanside High School, Oceanside, New York.

COLLEGIATE VOCATIONAL EDUCATION TRAINING PROGRAM (COVET), The City University of New York.

AN INVESTIGATION OF THE RELIABILITY AND VALIDITY OF SELECTED TRADE COMPETENCY EXAMINATIONS AND THEIR USE IN EVALUATING PROSPECTIVE TRADE AND INDUSTRIAL TEACHERS, State University of New York at Oswego, Oswego, New York.

AN INNOVATIVE APPROACH TO THE DEVELOPMENT OF A CURRICULUM FOR OCCUPATIONAL EDUCATION IN THE SECONDARY SCHOOLS IN A LARGE URBAN CENTER, Board of Education of the City of New York.

AN AUTOMATIVE DEVELOPMENTAL COUNSELING SYSTEM, Rochester City School District.

## COMPLETED 4(a) PROJECTS

AN EVALUATION OF THE EFFECTIVENESS OF MDTA INSTITUTIONAL TRAINING PROGRAMS IN NEW YORK STATE, Cornell University, The New York State School of Industrial and Labor Relations.

This RCU was involved in the development of the proposal for the above study for its submission to the U.S. Office of Education.

## PROJECTS IN DEVELOPMENTAL STAGE

1. The total program of apprenticeships in New York State will be surveyed by the State Department of Labor and the State Education Department toward the goal of understanding the respective roles of each department together with responsibilities of the employer, the apprentice and the local school board.

   The bureau will obtain information as to the program costs of related and supplemental instruction during the first phase of the study.

2. A staff member was engaged in the development of plans for a study concerned with teacher effectiveness in the area of industrial arts. This development is being coordinated with the Bureau of Industrial Arts.

3. Consultation has been made with the New York State School Boards Association for the purpose of exploring the feasibility of a study of school board membership.

4. Plans are in prograss for an evaluation of School to Employment Programs (STEP) in New York State. An assistant is being utilized in the work of statewide data collection.

## DISSEMINATION ACTIVITIES

1. Dissemination of research projects from ERIC to the content bureaus in the Division of Occupational Education was begun. This information will be incorporated in a periodic Newsletter which the unit will also begin disseminating.

2. Contact people at a local level were solicited from the chiefs of various vocational service bureaus. These people who operate in schools and universities will receive research and developmental materials from this unit on an ongoing basis.

3. Development of a monthly Newsletter was begun. The Newsletter will contain listings of current research projects in occupational education derived from the ERIC publications, out-of-state publications and pertinent New York State publications. It is hoped that the Newsletter will provide a common ground for the exchange of ideas between the research level and the implementation level at the local school system. Distribution of the Newsletter will include: RCUs, New York State District, City, and Village Superintendents, Directors of Pupil Personnel Services, Guidance Counselors, Boards of Cooperative Educational Services, intra-departmental and to all other agencies and professional staff who have expressed an interest.

   It is expected that the Newsletter will be ready for distribution in May.

4. Mailing lists have been expanded. Abstracts and summaries of completed projects have been sent to practitioners on a statewide basis.

   The following abstract was sent to RCUs, Guidance Counselors, Pupil Personnel Directors, department personnel and to ERIC:

   REPORT ON NEW YORK STATE DATA FROM A NATIONAL FOLLOW-UP STUDY OF HIGH SCHOOL LEVEL TRADE AND INDUSTRIAL VOCATIONAL GRADUATES.

   The final copy of the following report was sent to RCUs, department personnel, all New York State Pupil Personnel Directors and to the USOE:

   A FEASIBILITY STUDY TO INVESTIGATE THE STRUCTURE AND OPERATION OF A MODEL OCCUPATIONAL INFORMATION DISSEMINATION UNIT WHICH WOULD OPERATE BETWEEN THE NEW YORK STATE EMPLOYMENT SERVICE AND THE NEW YORK STATE EDUCATION DEPARTMENT.

The following summary was sent to department personnel, City and Village Chairmen of Business Departments, Secretarial Sciences Chairmen of New York City High Schools, Accounting Chairmen of New York City High Schools, ERIC, RCUs, selected Home Economic Instructors and to all those on the vocational education general mailing list:

USING PROGRAMED INSTRUCTION IN OCCUPATIONAL EDUCATION.

## PERSONNEL

Mr. Leonard Powell has left the unit for a position with the Bureau of Statistical Services. He is being replaced by Mr. Gregory Benson, Jr.

Mrs. Dorothy King has left the unit for a position with the Bureau of Manpower Development and Training.

Mrs. Ruth A. Leslie, Mrs. Jo Ellen Zalaznik, and Miss M. Marlene Martin have joined our unit as consultants.

*PROGRAM GUIDES; TEACHER ORIENTATION; *HEALTH OCCUPATIONS EDUCATION; *PRACTICAL NURSES; CURRICULUM; TEACHER RESPONSIBILITY; TEACHER QUALIFICATIONS; STUDENT EVALUATION; STUDENT RECORDS

Developed at the state and local levels by the state coordinator, the state advisor, and a local practical nursing coordinator, this revision of an earlier handbook used throughout the State is intended to assist prospective or new teachers of practical nursing in understanding the total program and the teacher's role. Discussions cover the role of the practical nurse, the basic elements of practical nursing programs, teacher qualifications and responsibilities, the teacher as a supervisor and a counselor, student evaluation and records, selection of text and reference books, and the teacher's professional growth. An outline of a minimum curriculum plan requiring 1,800 hours contains (1) classroom instruction on related subjects, nursing skills, the family, nutrition and diet therapy, and clinical nursing, and (2) clinical experience in medical-surgical, maternity, and pediatric nursing. The "Rules and Regulations of the State Board of Nurse Examiners for Programs of Practical Nursing" is a required supplementary reference. (JK)

## PREFACE

This handbook has been prepared to assist the prospective or new teacher of practical nursing. It is not a complete guide for the teacher but a supplement to other nursing education references.

Certain principles have been emphasized for those persons who have had little or no teaching experience. Each teacher should adapt this material to meet the needs of the educational program in which she is participating.

Robert Jacoby
State Supervisor
Technical and Industrial Education

# I THE PRACTICAL NURSE

The currently accepted definition of the practical nurse, as stated by the National League for Nursing and the National Association for Practical Nurse Education and Service is as follows:

> "The trained practical nurse is a person prepared by an approved educational program to share in the care of the sick and in rehabilitation and in prevention of illness, always under the supervision of a licensed physician and/or a registered professional nurse."

Fundamentally the practical nurse is a nurse, differing from the professional nurse only by the limitations of her educational preparation. Since the practical nursing education program is limited in its scope, the highly technical skills and the responsibility for the care of the acutely ill must rest with the professional nurse. The practical nurse however may play an assistive role in these instances and is qualified to plan and administer total nursing care to selected individuals. Generally speaking these include the subacutely ill, the chronically ill, the convalescent and the handicapped of all ages.

## II THE PRACTICAL NURSING PROGRAM

The practical nursing program, which is open to both men and women, includes the theoretical and clinical instruction necessary to master the knowledge and skills needed for practical nursing. These programs operate one year with 16-18 weeks of basic preclinical instruction, 30-33 weeks of supervised clinical experience and instruction in a hospital (clinical phase), and 3-4 weeks vacation and holidays.

### Preclinical Education

The preclinical phase of the program is given in the school and consists of the teaching of basic skills and the theory required to effectively apply these skills. During this portion of the total program, the practical nursing student develops a sense of responsibility for the safe performance of duties. Not only is the content of the program taught but each student learns the manipulative skills necessary to give safe nursing care. Numerous opportunities are given early in the program to practice what is being taught.

Classes are held five days each week. The week is generally 40 hours. The eight-hour day includes 5-6 hours of instruction, 1-2 hours of supervised study, and one hour for lunch. Several hours each week of clinical practice in a cooperating hospital are provided during this period. Scheduling of these hours is dependent upon location of clinical facilities in relation to the school.

### Clinical Education

The clinical period of the program is spent in a cooperating hospital where, under the supervision of a clinical instructor employed by the school district, the student is brought in contact with real nursing situations. The areas in which the student will practice are selected to give opportunity to master nursing skills, to establish favorable nurse-patient relations, and to participate in the planning of nursing care.

Experiences in which the student will be assigned include medical and surgical nursing, care of mothers and new borns, and care of children. Planned instruction is given by the school faculty during this phase. Individual supervision is imperative with emphasis on basic principles of nursing care, consequently the teacher - student ratio should not exceed 1 to 15.

Instructors continually evaluate the student's progress throughout both phases of instruction. Accurate and dependable evaluation of each student's progress and performance is the basis for counseling with the student.

### Program Administration

Programs of practical nursing in the public schools operate under the State-Federal Plan for Vocational Education utilizing State and Federal funds. The Technical and Industrial Education Division of the Department of Public Instruction is charged with the responsibility of implementing the program and

administering the policies established by recognized approving agencies. Supervision for adherence to policies and standards is the major responsibility of the Coordinator of Health Occupations in the Technical and Industrial Education office of the Department of Public Instruction.

Program Approval

All public school programs of practical nursing recognized by the State Board for Vocational Education must be approved by the State Board of Nurse Examiners as meeting their requirements for an approved practical nursing program in order that graduates of the program may be eligible for writing the licensing examination.

## III TEACHER QUALIFICATIONS

The primary requisite for teaching in practical nursing is that the individual must first have been competent in her chosen profession of nursing. As a successful practitioner, she displays an inherent ability and understanding of nursing. While this is an important attribute for teachers of nursing, it does not necessarily follow that knowledge of the subject automatically makes a good teacher. Nor does the mere desire for teaching qualify one for the field. In order for her to be successful, she must have the ability to impart to the student both the necessary information and the enthusiasm for nursing.

Enthusiasm must be accompanied by genuine faith in the practical nurse as a permanent member of the nursing profession. The teacher must have firm convictions that the practical nurse is a useful worker and that the use of this category of personnel is valid in our pattern of health care. This person is neither a subsitute professional nurse nor an aide. She functions on a level of nursing which falls somewhere between these two. Unless the teacher recognizes this level of nursing she will be unable to accept the responsibility for preparing the student to function effectively.

Through her nursing education the nurse becomes knowledgeable in content, but often lacks the principles of teaching. Generally speaking the completion of a nursing education program does not qualify the graduate to teach. In fact the nurse must qualify for the teaching profession through required courses offered by institutions of higher learning. Ultimately every teacher of practical nursing must acquire a minimum of a baccalaureate degree with 18 semester hours of professional education.

Teachers not meeting the requirements of college certification at the time of employment shall complete six semester hours of approved college studies yearly until full requirements for this certificate are met.

The teacher should have a clear understanding of the policies under which she will function and be willing and ready to uphold this obligation in her professional work. If she is not in accord with these policies she has a moral obligation to sever her connections. Only an attitude of constructiveness is welcome on the part of the instructional staff.

## IV RESPONSIBILITIES OF THE TEACHER

It is imperative that the practical nursing teacher makes herself responsible for understanding the organizational structure of the school district in which she is employed. The immediate supervisor is the Coordinator of Practical Nursing and it is to her that the teacher is responsible for all aspects of the program.

A certain amount of individuality is desirable and is encouraged. However, in every program one must conform to established policies in relation to the local school organization and authorities carrying the responsibility for the administration of the program. As a part of this organization the teacher must know and uphold these policies. She is also obligated to satisfy the requirements outlined by the approving agencies as well as by the local school which employs her. She should take the responsibility for examining her own qualifications and for making up any deficiencies that exist.

Most programs of practical nursing are divided into two well defined areas of instruction: The preclinical period, the major portion of which is classroom instruction; and the clinical period during which the major portion is supervised experience with fewer hours of class instruction. Since the second is an application enrichment of the first all teachers must have an understanding of both areas of instruction. Consequently teachers are employed with the understanding that they rotate freely between the two situations.

The specific responsibilities of the teacher will vary from time to time depending upon the area of instruction. The following suggested list of responsibilities include obligations during all phases of the program:

1. To share in establishing the philosophy, objectives and policies of the program.

2. To cooperate with the entire faculty in planning the educational program.

3. To assist with the formulation of student admission policies and the selection and promotion of students.

4. To develop unit plans, lesson plans and other instructional materials to meet the objectives of the program.

5. To adapt the teaching methods and media to meet the needs of the students.

6. To participate in the evaluation of students and the educational program.

7. To keep abreast of advances in nursing education and participate in professional and vocational organizations.

8. To share the philosophy and objectives of the educational program with the personnel of the cooperating institution.

9. To orient the student to the cooperating institution including policies, regulations, etc.

10. To maintain a satisfactory system of records

11. To participate in the counseling of students.

The success of any program of practical nursing is dependent upon continuing cooperation of the entire faculty. One dissenter reduces the competency of the entire faculty. This in turn causes deterioration of the program and is reflected in the attitude of its graduates.

## V INSTRUCTIONAL PROGRAM

Basic to the curriculum design is a clear understanding of the educational purposes of the program. What objectives do we wish to attain? These must be stated first, and should be reviewed at the time of actual planning or revising of the curriculum.

The preparation of the curriculum should be a joint effort of all members of the faculty and should include all phases of the program. Consequently, it is essential that each teacher be familiar with the components of the entire course of study, so that she may participate actively and constructively in its development.

The minimum number of hours to be devoted to each of these areas, for both theory and practice, are stipulated by the State Board of Nurse Examiners. Most programs exceed the minimum requirements in many areas and this is desirable within the boundaries of practicability.

The initiative and creativity of the faculty are brought into play when arranging material which is included in the course of study. The chief principle to follow here is that the content should be presented to students as nearly as possible in the form and manner in which it is to be used by them. This calls for integration and coordination of material centered around the patient.

In a short program it is essential that every experience be meaningful. No time can be spared for frills or for unnecessary activities. We must therefore select and organize the material and the experiences with the utmost care.

At times the cooperating hospital may be limited in available experience. The faculty may desire to supplement or enrich the program by utilizing additional community resources in the form of observations. For example, in communities where there are well-organized nursery schools, or kindergartens the faculty could make this available to the students. In every instance where observations are planned, provision must be made for adequate interpretation, orientation and supervision for the student. A written guide should be prepared to help the student understand the purpose of the observation and to point out what she is to observe. Conferences following the observation are most beneficial in determining the value of this experience. If possible planned observation should be arranged concurrently with comparable clinical experience.

Field trips although valuable are time consuming and often difficult to arrange at a time most meaningful to the student. The faculty should carefully evaluate this experience and schedule it only if it improves the students' understanding of the subject. Two hours is the maximum time credited to classroom instruction for any one field trip.

The total instructional program (curriculum) is approximately 1800 hours. Of these hours, one-third should be planned classroom instruction with the remaining hours for supervised clinical experience. The minimum curriculum plan includes:

## The Curriculum Outline

### A. Classroom Instruction

1. Related Subjects (150 hours)

   a. Body Structure and Function ---------- 60 hours
      Basic anatomy and physiology of the normal body

   b. Personal and Vocational Relations ---------- 30 hours

      1. Fundamentals of ethical, psychological, social, and human relations
      2. Civil, vocational and legal implications
      3. Personal and vocational growth

   c. Personal and Community Health ---------- 30 hours

      1. Good mental and physical health habits and their application to personal and community living, disease transmission and control
      2. Sanitary laws and methods commonly used to protect health and promote safety in the community
      3. Appreciation of the importance of parental care

   d. Introduction to Conditions of Illness ---------- 30 hours

      1. Terminology
      2. Effect of disease on normal body
      3. Basic principles of nursing care
      4. Interpretation of cardinal symptoms of disease
      5. Rehabilitation of patient and prognosis of disease

2. Nursing Skills (195 hours)

   a. Nursing Principles and Practices ---------- 180 hours
      Principles underlying nursing skills, with practice, in order to develop fundamental skills .

   b. Drugs and Solutions ---------- 15 hours

3. The Family ---------- 30 hours

   a. Stages of development
   b. The young adult
   c. The middle aged
   d. The aged

4. Nutrition and Diet Therapy (45 hours)

   a. Principles of Nutrition ---------- 30 hours
      Nutrition as an important factor in attaining physical fitness

   b. Diet Therapy ---------- 15 hours
      Modified and special diets

5. Clinical Nursing (180 hours)

a. Adult Conditions of Illness (135 hours)

1. Medical-Surgical Nursing ---------- 105 hours
2. Drug Therapy ---------- 30 hours

b. Maternity Nursing ---------- 30 hours

1. Pre and post natal care
2. Care of the newborn

c. Pediatric Nursing ---------- 15 hours

1. Approach to illness in which the general deviation from normal body functions are considered as they relate to the child
2. Nursing care of children

Note: Maternity nursing and pediatric nursing, at the discretion of the faculty, may be combined as a unit of Maternal and Child Health.

B. Clinical Experience

1. Medical-Surgical Nursing ---------- 22-26 weeks
Care of the adult patient to include the geriatric patient
May include the following as available:

a. Central Supply Service

b. Recovery Room

c. Observation of Surgery

d. Observation of Medical and Surgical Clinics

e. Psychiatric Unit

2. Maternity Nursing ---------- 6 weeks

a. Care of mothers to include labor and delivery -------- 4 weeks

b. Care of Newborns ---------- 2 weeks

c. Pre and postnatal clinics observation as available

3. Pediatric Nursing ---------- 4 weeks

a. Care of children

Note: Students may be assigned to two weeks each of night and/or evening experience not to exceed four weeks. Such assignments must be adequately supervised by school faculty personnel.

C. Vacation and Holidays ---------- 3-4 weeks

Five instruction days of vacation constitutes a week

## VI THE TEACHER AS SUPERVISOR

According to definition, the function of supervision is that of oversight and direction. How is this applied to the practical nursing teacher as she assists the student in developing acceptable habits in the performance of bedside nursing? In contrast to the supervisors in nursing of yesterday, today's teacher does not function as an inspector or overseer but rather provides constructive, cooperative assistance to the student throughout the learning period. Consequently, supervision is a function requiring tact, sympathetic understanding and tolerance.

It is through supervision that the teacher constructively assists the student to realize her capacities and to achieve them to their fullest. Supervision is an art by which the student requires meaningful standards through a learning and relearning process. As a student performs under friendly and constructive guidance she develops a broader concept of underlying principles so that she may eventually emerge ready to assume her responsibilities with less supervision.

The good teacher will want to undertake this task with full knowledge of the important basic rules underlying successful supervision. These are:

1. The teacher must have a thorough understanding of all phases of the procedure being performed. Uncertainties and inadequacies on the part of teachers impart confusion to the student.

2. Explanations must be made clearly and concisely. Reiteration is often necessary if the student is to grasp fully the implications of what is taught.

3. Students need to know how and why things are done according to a certain accepted method.

4. Instructors must be aware of individual differences and should individualize their approach to students. What may be very clear to one student may be utterly confusing to another.

5. Consistent standards of performances are to be maintained. Although appreciation for honest effort is needed, acceptance of below standard performance may prove hazardous.

6. The student should be judged fairly and given credit for satisfactory accomplishment. Everyone needs to feel a sense of pride in what she has done. A student experiences this pride when her performance deserves praise from the teacher.

7. Tact must be employed when correcting or disciplining a student. Embarrassment in front of classmates and patients should be avoided. The teacher should always use a normal tone of voice. Shouting has no place in supervisory technique.

8. Above all, be patient. Take time out to show the student again and again. Assist her as she develops acceptable practice.

## VII THE TEACHER AS COUNSELOR

Every teacher is a counselor. Even though her preparation has not included the art of counseling, much success can be realized through personal study and good common sense. The question is: What can the teacher, who is a layman in psychology, do in the way of guidance?

Since guidance means helping a person to fit well into her environment, the teacher will be chiefly concerned with helping students understand themselves. This is done by helping them to define their immediate requirements, interests and problems. As they understand themselves better they also gain a better understanding of their families, friends, and the whole community.

In the guiding process, then, one's attention must be centered in the student's personal interests, abilities, apparent needs and recognized problems. The teacher must be sensitive to the student as she comes in daily contact with her. In this way the basic causes of problems may be found and can be dealt with accordingly.

Helpful to the teacher is an awareness of the student's background. Certain pre-entrance records will be valuable in showing past trends in the individual's development. The scores on the pre-entrance tests may also be a valuable tool in guiding the individual student. A record of the student's monthly progress is essential.

At all times there must be good rapport between the teacher and students. This rapport is strengthened as the student learns the value of "talking out" her problems to a good listener in whom she can confide. It is in this "talking out" process that the student begins to see her own solutions not only for the present but for the future problems which are similar in nature. Accessibility of the teacher or listener at a time when the need is acute is most important. As students learn to solve their own problems they may better appreciate their own competencies and then set for themselves more realistic goals.

If student requirements are to be met satisfactorily, counseling must be done on an individual basis. The student is looked upon as a friend whom the teacher is anxious to help and understand. Improvement is often noted in students whose teachers have taken personal interest in their welfare.

Guidance is also accomplished by the building of group morale. It is the duty of every teacher to create a classroom atmosphere conducive to freedom of expression. Participation without criticism lays the foundation for good esprit de corps. Students must be encouraged by commendation for work well done.

Guidance actually is a matter of teaching students how to get along well. For each person who has the desire and the will to teach there will be personal satisfaction in working with happier and better adjusted students.

## VIII STUDENT EVALUATION

The objective of education is to change behavior, so it is important to observe the progress of the student in order to determine the effectiveness of the learning process.

Prior to enrollment, the student is evaluated carefully by the faculty through appropriate records, tests and interviews with a view to selecting qualified students. This procedure of individual consideration should be continued just as carefully after admission into the program. It is most important not to encourage a student to remain in school when found unsuitable by virture of personal background, attitudes, health, scholastic ability or home responsibility.

The preclinical student is evaluated in terms of knowledge, skills and attitudes. During this phase of the program, the teachers will need to develop evaluation procedures which will best measure these three areas.

Knowledge is usually measured by administering tests and examinations that are oral, written or practical. Interpretation of the results of these tests should indicate the capacity and achievement of the learner. Regardless of other qualities exhibited by the learner the intellectual ability to absorb and apply basic facts and principles is extremely important. It is unfair to every one concerned to ignore this. Evaluation of this capacity must be frequent and varied if the judgment is to be valid and reliable.

While knowledge is essential for the practical nursing student, it must also be remembered that knowledge without skills is comparatively useless. As the learner performs in the classroom from day to day, the teacher recognizes the degree of her skills. Very careful observation soon makes it possible to determine whether or not there are potentialities which, through guidance and repeated practice, will blossom into fruition. Frequent notations about the student's performance will facilitate evaluation of her progress at regular intervals.

Practical nursing educators are also aware of another attribute which is necessary in practical nursing, namely, adaptability. A common cause of dissatisfaction on the part of an employer of a graduate practical nurse is her inability to adapt herself to her environment and her associates. Nursing is an occupation in which the individual must work closely and amicably with other people. There is little opportunity to work independently. Consequently the teacher should be constantly alert to the student's relations with others and the attitude she portrays.

In the clinical period, standard progress reports should be compiled at the close of each major period of experience. The purposes of this report are:

To assist the student in her personal development and in the improvement of nursing care.

To provide the administration with a report of the student's progress.

During clinical assignments frequent conferences should be held with the student to keep her apprised of her progress. In this way there is adequate opportunity for the student to overcome her weaknesses. An evaluation is best done by two or more people. In addition to the statement of the clinical teacher, comments by the head nurse are most helpful. It is desirable for these two persons to prepare progress reports jointly. All reports are to be signed by the clinical teacher and the head nurse.

Students should be evaluated only in those categories where observation has been sufficient to warrant a fair statement. Otherwise, comments and ratings should be withheld. Specific examples should be stated to justify comments. It is recommended that anecdotal records be kept on all students to help with supervision and evaluation. Strong qualities should be emphasized and suggestions made for the improvement of weak ones. Every effort should be made to be as objective as possible in making these assessments.

The progress report should be thoroughly discussed with the student and she should be given the privilege of writing her own comments before signing it.

## IX RECORDS

A complete set of records must be kept for each student in the school. The student's cumulative and permanent file is prepared and maintained by the coordinator. However the teacher should be familiar with these records and know how and what she should contribute to the permanent record.

The teacher is chiefly concerned with those records which she, herself, must keep throughout the course of study. One of these is the class attendance record or class roll. This may be arranged to provide space for attendance and a brief statement regarding the topics discussed on particular dates. When completed, this form provides data on hours of class attendance, grade and topical outline of the course.

In order to provide a grade for those classes which she has taught, the teacher will need to maintain a record of periodic evaluation on each student. From these evaluations a final grade is obtained.

During the clinical period the teacher keeps accurate and complete records of the student's performance and experience. Through frequent anecdotal notations of student observation the progress report completed at the conclusion of each experience period is simplified. The progress report is the summary of the student's performance. At the completion of the student's educational program the faculty participate in summarizing all progress reports. This summary is incorporated into the student's final record to be used for future references and transcripts.

The teacher in the clinical situation is responsible for certifying that each student has had comparable learning experiences. She will need to devise some form of record for identification of these experiences. Other records may be required by the teacher's employer. Instructions for such records must be made available to the teacher.

## X SELECTING TEXT AND REFERENCE BOOKS

The new teacher entering the field of education will feel the need for adequate resource material. The textbook is the initial source of information and therefore must be selected with care.

The importance of a textbook is not just in having one, but rather in how it is selected and used by the teacher and her students.

This selection is determined by some of the following criteria. First the textbook must be written by an authority in the particular specialization. One should know the author's background, her professional qualifications and her ability to interpret the subject to the learner. The best qualified authors realize the need for constant revision of materials in a textbook. This necessitates the purchase of new editions frequently. The teacher, however, must examine new editions to be certain that the changes are sufficient to warrant this additional expense.

All textbooks must be considered in the light of purchase price, however, the physical attributes of the book must be studied so that the quality is not forfeited for decreased cost. The letter type should be large enough for easy reading. The paper should be of the non-glazed type to prevent glare and the book should be so constructed that it can be easily held.

Any book is meaningless unless it is written with the learner in mind. Material must be presented at a level that she will understand. The organization of the text must be easy to follow and there must be a smooth flow of words which have meaning for the student.

No one teacher is capable of selecting all books wisely. It is recommended that all members of the faculty participate in the evaluation of several possibilities before a definite selection is made.

The best textbook provides basic information on a given subject. As the teacher becomes more familiar with the literature in the field she will use additional reference books. These are valuable as a means of presenting similar ideas in a variety of ways or of stating contrasting opinions to stimulate thinking and reasoning processes. These books are available in the library of the practical nursing program. All members of the faculty should make recommendations for additional library books.

## XI PROFESSIONAL GROWTH

The term professional growth refers to the furtherance of professional and personal development.

The teacher, although prepared academically, needs to keep abreast of the rapid changes or transitions which are occurring in education today. For this reason, she should avail herself of advanced courses offered both in general and professional education. This should help her to be a more effective teacher as well as an individual who is adjusted to society.

Considerable help should be available from the coordinator of the program who is generally more experienced in practical nursing education. The coordinator can be helpful by broadening the teacher's understanding and thinking through her problems with her, sharing experiences, and directing the teacher to other sources of information and assistance.

For the teacher who has had no experience in practical nursing education, an opportunity to observe an outstanding program in operation may be helpful. This is one way in which she may gain insight into and understanding of the task which lies before her. A feeling of confidence and security comes from knowing that her plans are in keeping with the general pattern which is followed in recognized schools.

Assistance may also come from people in other fields of endeavor. There is no barrier which limits the teacher of practical nursing to her own sphere of work. It is virtually important that she keeps in close contact with the world about her and understands the opinions, hopes and desires of other human beings. Only in this way can she be an effective instrument for learning.

Participation in professional organizations provides the atmosphere for an inter-change of thoughts within a homogeneous group. It is a stimulating experience as well as a reassuring one to have an opportunity for free exchange of ideas with colleagues.

Conferences and workshops designed for professional growth are extremely beneficial to the individual teacher. Many of these are in the nature of in-service education conducted within the faculty organization or by the Department of Public Instruction in which various faculty groups are brought together.

At the teacher's disposal are many books, professional magazines, research articles and other resource materials. Every teacher should keep up-to-date in professional reading.

The teacher should develop a willingness to be self-critical as well as to accept constructive criticism from her supervisor. When the teacher is open-minded and capable of making the necessary improvements in her habits, ideas and personal or professional attributes, she will grow professionally.

*HEALTH OCCUPATIONS EDUCATION; *PRACTICAL NURSES; PROGRAM PLANNING; *EDUCATIONAL FACILITIES; *STATE STANDARDS; SCHOOL SPACE; LIBRARY FACILITIES; *FACILITY GUIDELINES

This guide was developed by a state coordinator of health occupations on the basis of experience in approved programs. To assist in planning the establishment, relocation, or expansion of facilities, specific recommendations for implementing the more general recommendations of the State Board of Nurse Examiners are given for offices, classrooms, laboratory, library and study facilities, student lounge, and heating, lighting, and ventilation. Eight general recommendations concern amount of floor space, drinking fountains, bulletin boards, parking area, floor plan requirements, and plan submission. (JK)

## PRACTICAL NURSING FACILITIES

Proposed facilities for administration and teaching of practical nursing programs must be approved by the Department of Public Instruction and the State Board of Nurse Examiners prior to construction. The proposed plans are submitted to the Technical and Industrial Education staff for preliminary review and approval. Following preliminary approval, the Technical and Industrial staff forwards the plans to the State Board of Nurse Examiners and informs the local school district when final approval is obtained.

To assist in the planning of a practical nursing suite the requirements and recommendations of the State Board of Nurse Examiners are listed below in large print followed by suggestions and recommendations for implementation.

A. THE DIRECTOR (COORDINATOR) AND CLINICAL INSTRUCTOR SHOULD HAVE SEPARATE OFFICES WITH ADEQUATE SPACE FOR THE NECESSARY FILES FOR OFFICE STAFF AND INSTRUCTIONAL STAFF.

Recommendations:

1. Private office for coordinator of practical nursing with desk, bookcase, files, and chairs for conducting selection interviews and student counseling.

2. One office for every two instructors to accommodate a desk for each instructor, files, chairs and bookcases.

3. Space for receptionist-secretary located close to the entrance of the facility. Provide several chairs and coat rack for visitors.

B. THE NUMBER AND SIZE OF CLASSROOMS SHALL BE DETERMINED BY THE MAXIMUM STUDENT ENROLLMENT. CLASSES IN NURSING CARE MAY BE TAUGHT IN A LABORATORY WITH FURNISHINGS AND EQUIPMENT SIMILAR TO A HOSPITAL SITUATION OR IN THE ACTUAL HOSPITAL SETTING.

Classroom - Recommendations:

1. At least one of sufficient size to accommodate the entire class at one time.

2. Provide chalkboards, bulletin boards, teacher's station.

3. Provide for use of projection equipment

4. Provide for storage of visual aids: Torso, skeleton, charts, models, and projection equipment.

5. Provision for teaching cooking and nutrition is dependent upon curriculum content and availability of facilities in the school. If provided, the area should include sink, stove, refrigerator and counter space.

Nursing Laboratory - Recommendations:

1. A necessity in the public school programs.

2. Floor space to accommodate at least five hospital beds, each with bedside table and chair. Provide at least three feet of space between each two beds.

3. Built-in counter space with storage above and below and one double sink should be provided to accommodate ten students.

4. Built-in storage room for linen, supplies, auxiliary equipment such as stretcher, wheel chair, etc

5. Provide electrical outlets at bed areas and at counter space.

6. For facilitation of group demonstrations it is highly recommended that this laboratory be located adjacent to the classroom with folding door between the two.

7. For schools located in rural areas wherein laundry delivery may be deterrant during concentrated practice periods, it may be advisable to include a washer and dryer in the facility, necessitating provisions for such installation.

8. To avoid exposure during times when students are "patients", the nursing laboratory should not be accessible from public corridors.

C. THE LIBRARY AND STUDY ROOM SHOULD PROVIDE AN ADEQUATE NUMBER OF SUITABLE TABLES AND CHAIRS FOR STUDENTS AND FACULTY.

Recommendations:

1. Considered sufficient size when it provides for seating of 35 percent of total student enrollment at one time.

2. Provide built-in adjustable bookshelves with magazine section.

D. THERE SHOULD BE A COMFORTABLE STUDENT LOUNGE WITH ADEQUATE TOILET AND LOCKER FACILITIES AND A DRINKING FOUNTAIN.

Recommendations:

1. Develop the lounge-locker area in one combined multi-purpose room to avoid two small areas.

2. To provide a dressing area at such times when students become patients for nursing practice, locate in close proximity to nursing laboratory and away from reception area.

3. Number of lockers provided should be determined by size of classes to be admitted.

4. Lounge furniture should be provided, especially if students will be permitted to use this area for smoking.

5. If men students are to be enrolled, provide a lavatory-dressing-locker space in one room. Usually provision for two per class is sufficient.

E. THE CLASSROOMS, LABORATORIES, AND LIBRARY SHOULD BE ADEQUATELY HEATED, LIGHTED AND VENTILATED AND BE FREE FROM ANNOYING DISTRACTIONS.

Recommendations:

1. The practical nursing facility should be located in the "quiet" area of the school.

2. If area is to be air-conditioned specify. Air-conditioning is advisable since this facility is used during summer months.

General Recommendations:

1. A floor space of 2700 square feet is reimbursable for classes of 15-20 full-time students (one teacher situation). For larger classes (based on one teacher to 15 students) the total space allotted will be increased and the size and number of rooms required will be related to the number of students to be accommodated.

2. Provide a drinking fountain with the facility.

3. Closet and storage space should be provided wherever feasible.

4. Provide bulletin boards in classrooms and corridors.

5. The facility should be located for easy access from the car parking area.

6. Room sizes should be indicated on the plan.

7. Plans shall show placement of all fixtures and furnishings and drawn to 1/4 inch to the foot scale.

8. Submit two copies of the final plans to be forwarded to the State Board of Nurse Examiners

Der Hovanesian, Joseph
A Study of the Practices Used and Valued by Teachers of the More Effective and Less Effective Adult-Farmer Programs in Michigan.

MF AVAILABLE IN VT-ERIC SET.
Pub Date - Jun54 74p.

*ADULT FARMER EDUCATION; *TEACHING PROCEDURES; *COMPARATIVE ANALYSIS; *PROGRAM EFFECTIVENESS
MICHIGAN

The purpose of the study was to determine the practices used and valued by Michigan teachers in both the more and the less effective adult farmer programs, and whether there were any significant differences in practices used and valued by the two groups. Effectiveness measured by use of Schroeder's 10 criteria for evaluating adult farmer classes determined the selection of 15 more effective and 14 less effective programs. Previously-collected data were analyzed. Of the 167 practices listed under 13 headings on the original questionnaire, 37 were "proven best," 51 were "proven good," 16 were "possibly good" practices, 41 were "unproven but showed promise," and 22 were "unproven." Practice usages were quite consistently distributed throughout the 13 headings by both groups but teachers in the more effective programs used significantly more practices. These teachers also used and valued more of the generally more valued practices, while teachers in less effective programs used and valued some of the generally less valued practices. Some highly valued practices were not generally used, some teachers used practices of limited value, and some teachers used practices not valued highly by those using them. Schroeder's 10 criteria, the original questionnaire, references, and a list of practices used and valued are included. (JM)

ACKNOWLEDGMENT

The author wishes to express his sincere appreciation for the generous advice and aid given by Dr. H. P. Sweany, under whose guidance this study was conducted. He is also grateful to other members of the Education staff from Michigan State College for help they have rendered.

The writer is also indebted to Dr. W. P. Schroeder and Mr. R. E. Moeckel whose data from their studies were used in this problem.

# CHAPTER I

## THE PROBLEM AND DEFINITION OF TERMS USED

For many years, programs of adult-farmer classes have been conducted. The combination of practices that have been used are as numerous as teachers that have conducted adult-farmer classes. It was known that some programs are more effective than others, but what makes these programs more effective was not completely understood. There has not been any real conclusive evidence that shows some practices used in organizing, planning, conducting and evaluating of adult programs as being more effective than others. The writer realizes that it is not only the use of certain practices that makes a program succeed, but there are also other factors that contributes to their success or failure. Such things as community differences, the way in which practices are put into operation, etc. all influence the effectiveness of an adult-farmer program.

In this study, the author was concerned with the influence of certain practices with more effective and less effective programs.

### I. The Problem

Statement of the problem. It was the purpose of the study (1) To determine practices used and valued by teachers

in the more effective adult-farmer programs in Michigan; (2) To determine practices used and valued by teachers of the less effective adult-farmer programs in Michigan; and (3) To determine if there are any significant differences in practices used and valued by the above two groups. If there are, these differences in usage of practices may have influenced the difference in effectiveness of the educational programs for adult-farmers.

Importance of the study. In 1951-52, there were 157 adult-farmer programs in Michigan with each characterized by the use of certain practices. These practices were probably adopted because vocational agriculture teachers believed they were the best for their programs. However, it was the opinion of the writer that despite the usage of certain practices and values placed on them by teachers of adult farmers, many can be replaced by more effective practices which will yield more successful adult-farmer programs. All teachers of vocational agriculture are concerned with the improvement of their respective programs, thus the findings in this study will be of utmost importance to them. The finding of approved practices through objective and scientific evidence can aid Michigan teachers of adult-farmer classes in selecting and using better practices. These practices can and may result in more effective programs for farmers.

## II. Definition of Terms Used.

Adult-Farmers. This term includes farmers that are established in farming, usually 25 years old or older. They are primarily tenants and owner-operators, but they may also include farm employees and small acreage or part-time farmers.

Adult-farmer class. This term refers to adult farmers enrolled in systematic instruction over areas of their interests and needs. The class is under the direction and supervision of a certified vocational agricultural teacher or someone appointed by the board of education.

More effective program. A program of adult-farmers that make more than average progress as a result of systematic instruction. The relative progress or success that determines the relative effectiveness of the program is measured by Schroeder's[1] ten criteria.

Less effective program. This term is used to designate programs that do not measure up to average progress resulting from systematic instruction. They may be called "unsuccessful," "least effective" or "ineffective" programs. The same criteria

---

[1]Walter P. Schroeder, "An Analysis of Practices Used In Evaluating Local Programs of Adult Education In Vocational Agriculture," (unpublished Doctor's Thesis, Library, Michigan State College, E. Lansing, Michigan), 272 pp.

as used for determining success of the most effective programs were used in determining relative success of the less effective programs.

Adult-farmer program. This term designates one or more adult-farmer classes conducted by one or more teachers from a given school service area.

Practices. This word is used to describe techniques that are employed by vocational agricultural teachers for organizing, planning, conducting and evaluating vocational agriculture classes. The word includes techniques used for: (1) handling administration and policy; (2) informing other people about the program, (public relations); (3) planning a program; (4) organizing class groups; (5) scheduling and locating classes; (6) planning the instruction; (7) conducting classes; (8) conducting on-farm instruction; (9) financing; (10) providing teachers and teacher time; (11) supervising special teachers; (12) evaluating; and (13) conducting social activities and special features.

## Limitations of Study

1. Because of its length, the original questionnaire used by Moeckel was split into two parts, schedule A and Schedule B, thus making it impossible to get a complete list of the practices used by each teacher.

2. If the criteria used in evaluating programs of adult farmers are not of equal value, the methods used in scoring the programs are incomplete and may not have properly ranked all of the programs.

3. The sample of teachers may not have been large enough since each teacher only responded to half of the questionnaire of practices.

4. Practices that are successful in one community may be unsuccessful in another community due to community differences.

5. Certain practices may work successfully with one teacher and unsuccessfully with another due to differences in the teachers.

## Assumptions.

This study is based on the following assumptions.

1. Practices of high value will be used and valued by teachers from the more effective programs of adult-farmers.

2. The teachers with the less effective programs will use and value both more effective and less effective practices.

## CHAPTER II

## REVIEW OF OTHER STUDIES AND RELATED LITERATURE

As has been previously mentioned, there have been no studies conducted that provide objective evidence to validate certain practices as being superior or inferior. Most of the related studies and literature reviewed below deal with the selection of practices on the basis of usage or on the basis of personal selection which involves judgment and bias.

For convenience, findings and interpretations of other studies are divided under four categories. The first is organization, the second is planning, the third is conducting, and the fourth is evaluating.

### Organization

Moeckel[1] with his work in Michigan found the popularity of different practices and the value which vocational agriculture teachers placed on them. Moeckel states, "some adult-farmer classes are very large and might be separated into two or more class groups."[2]

---

[1]Rolf. E. Moeckel, "A Study of Practices Used by Teachers of Adult Farmer Classes in Michigan," (unpublished Master's Thesis, Dept. of Agriculture Education, Michigan State College, East Lansing, Michigan, 1953), p. 104

[2]Ibid., p. 82

Shockley[3] in his review of other studies found that it may be advantageous to divide adult groups according to age. This review of studies indicated there are three important leaders that can help in establishing a class. They are: (1) the teacher, (2) the minister, and (3) the progressive farmers.[4] "The use of a large and active advisory council often aids in getting the classes started on time.[5] Shockley found that another good technique is to secure names of interested farmers through all-day pupils,[6] along with "personal visits, mailed notices and telephone calls . . ."[7]

Brown, with his work in California found the "enrollment may be best secured through personal contact with the farmers in the community though visits may be supplemented by form letters and newspaper announcements."[8]

S., 1926., University of California), Summaries Of Studies In Agricultural Education, Vocational Division Bulletin No. 180, Supplement No. 1, (Danville, Illinois: The Interstate Printers and Publisher, 1943), p. 34-35.

## Planning

Shockley found that the best time of year for adult classes depends largely upon what is to be taught.[9] "For some states, January or February was found to be the best time to begin the adult class."[10] The high school or a rural school, depending upon the convenience of the group, was found to be the best place for adult class meetings.[11] This is true because at a school better use of blackboards, charts, and other illustrative material may be made. Shockley also found that special teachers who will teach adults should be thoroughly trained.[12]

Contrary to Shockley's findings, Moeckel recommended that "consideration may be given to the possibility of holding more adult-farmer classes in locations other than the high school."[13] In agreement with Moeckel's recommendation, Schroeder[14] used special teachers to conduct classes.

---

[9]Shockley, Op. Cit., p. 14.

[10]Ibid.

[11]Ibid., p. 15.

[12]Ibid., p. 19.

[13]Moeckel, Op. Cit., p. 83.

[14]Walter P. Schroeder, "A Case Study of the Development of a Program of Agriculture Improvement with Adults in the Olivet, Michigan, Community" (unpublished Master's thesis, Division of Education, Michigan State College, East Lansing, Michigan, 1947), p. 83.

Clark,[17] with his study in Ohio, found that the use of a planning committee was somewhat time-consuming, but resulted in greater interest on the part of the students. Brown[18] found it advantageous to have the teacher outline the course with the help of farmers who attend the classes. He felt that the needs should be determined by observation made possible by means of personal contacts with the class members.

## Conducting

Retention appeared to increase when motion picture film was used according to Shockley.[19] He also found that a teaching plan helped to motivate discussion. Shockley summarized, that in order to further develop interest, "use the supervised farm practices as a means of making the instruction function in the lives of the members of the group."[20] He also believed that personal visits to the members of the class along with awarding of certificates at the end of the year to be valuable practices that can be used to increase interest.

[17]Loy R. Clark, "Developing a Procedure for Organizing an Adult Farmer Program At Frederickton High School," (nonthesis study, 1952; The Ohio State University), 41 pp. Summaries Of Studies In Agricultural Education, Vocational Division Bulletin No. 180, Supplement No. 6, (Danville, Illinois: The Interstate Printers and Publishers, 1953), p. 15.

[18]Brown, Op. Cit., p. 34-35.

[19]Shockley, Op. Cit., p. 18.

[20]Ibid., p. 21.

Moeckel[21] recommended more participation by school administrators in adult-farmer classes. He also thought that more special features such as recreational activities and award banquets might be used by teachers of adult work.

Parent[22] agreeing with Moeckel also believes that provision should be made for recreation during evening school (as it was called then) instruction. He listed this practice as one influencing the success of evening school instruction.

Brown states that, "instructors should be selected who are familar with the local farming conditions and are qualified to give instruction, the local teacher of agriculture being the most logical excepting very specialized courses for which the local teacher is not well qualified."[23] He also recommended the conference method of teaching rather than the lecture method.

S., 1941, Louisiana State University and Agriculture and Mechanics College, 61 pp., Library, Louisiana State University, University Station, Baton Rouge, Louisiana), Summaries Of Studies In Agricultural Education, Vocational Division Bulletin No. 180, Supplement No. 2, (Danville, Illinois: The Interstate Printers and Publishers, 1941), p. 80.

[23]Brown, Op. Cit., p. 34-35.

## Evaluation

Shockley summarized that teachers of adult-farmer classes should "check all practices followed by the adult-farmers."[24]

According to Phipps and Cook,[25] an advisory council should annually evaluate the total program of vocational education in agriculture for adults. "Evaluation should be based on the objectives of the total adult-farmer program and on specific objectives of each course."[26]

Kiltz[28] recommends the use of surveys through a period of years to determine the progressive introduction and improvement of practices used by adult farmers as a result of instruction.

## Summary of Other Studies

For the convenience of the reader, significant findings from other studies are summarized here under organization, planning, conducting and evaluating.

### Organization

1. Large groups should be separated into two or more class groups.

2. Divide class according to age.

3. Advisory councils can aid classes getting started.

4. All-day pupils can aid in recruiting members.

5. The progressive farmer, teacher and minister are leaders that can help establish the class.

### Planning

1. There is disagreement as to the place adult classes should be held.

2. Time of year for class depends on what is to be taught.

3. A planning committee may be helpful in planning the course of instruction.

4. Class members should aid in planning.

5. Needs can be determined by surveys made possible through personal contact with class members.

## Conducting

1. Motion pictures seem to increase retention.

2. Use supervised farm practices as a means of making instruction function in the lives of the members of the group.

3. Award certificates at the end of the year.

4. School administrators should be encouraged to participate in adult-farmer classes.

5. Recreational activities and award banquets are believed to be helpful in stimulating interest.

6. The conference method is preferred to the lecture method.

7. Base instructional topics on local problems.

8. Only use qualified teachers.

## Evaluating

1. Check practices followed by the adult-farmers.

2. Have advisory council evaluate the program.

3. Base evaluation on course objectives.

4. Use survey over a period of years to note change in farming that can be attributed to adult-farmer instruction.

## CHAPTER III

## METHODOLOGY

This study was essentially a continuation of Moeckel's[1] thesis study that dealt with practices Michigan teachers used in organizing, conducting and evaluating adult-farmer classes. Moeckel secured data from essentially all Michigan adult-farmer programs and summarized practices used and valued by them. This study differs from Moeckel's in that the practices used and valued were summarized from two select groups of adult-farmer programs in Michigan. These two groups were selected from Moeckel's original group of 76 programs.

The two select groups differed from one another in terms of relative effectiveness. The more effective or successful groups will be referred to as the "more effective programs," and the less successful or less effective groups will be referred to as the "less effective group." Effectiveness was measured by the use of Schroeder's[2] ten criteria for evaluation of adult-farmer classes. A list of these ten criteria can be found in the appendix. A raw numerical range of scores of 292 was possible under one criterion and relatively narrow ranges were possible under some of the other criteria. Due to

---

[1]Moeckel, Op. Cit., 104 pp.

[2]Schroeder, Op. Cit., 272 pp.

the variation of these ranges, it was thought feasible to change each raw score to a "z" score. The following formula was used to convert raw scores to "z" scores.

$$S.\ D. = \sqrt{\frac{\Sigma X^2 - \frac{(\Sigma X)^2}{N}}{N}}$$

$$\text{"z" score} = \frac{X-M}{S.D.}$$

S. D. = Standard deviation

$\Sigma X$ = Sum of raw scores in group

N = Number in group

M = Mean of raw scores

X = Any given raw score

After the scores had been standardized, a total for the "z" scores for each criterion was determined for each program. This total represented a numerical expression of effectiveness of a particular program. These sums of scores were then ranked from the highest to the lowest. The highest score of +13.67 represented the most effective program and

the lowest score of -16.73 represented the least effective program in the entire group. Two groups were then tentatively selected. All those that had attained scores from 0 or higher were placed in the "top group;" all those that had scores from 0 or less were tentatively placed in the "bottom group."

Next, it was found advisable to eliminate all programs taught by teachers with less than 3 years experience in the department. This was done because it would not be correct to associate practices used by new teachers with the status of a program attained by the former teacher with possible use of some different practices. Then the final selection of the two groups was made. The top ranking 15 were used to represent the group of "more effective programs," and the bottom 14 were used to represent the "less effective programs."

Of the less effective group, six programs had provided data on schedule A of the original questionnaire. Eight had furnished data on schedule B. Of the more effective group, ten had used schedule A, and five had provided data on schedule B on the original questionnaire.

Securing the data. The data for this study had been previously collected. The main concern was to analyze data for the two select groups from which data had been gathered. Moeckel's original questionnaire may be found in appendix A. It was used to secure data on programs under consideration

in this study. Moeckel's study was a part of a regional study on adult-farmer classes in several states under the sponsorship of the North Central Regional Committee for Research. The survey was originally developed by a Regional research committee from results of a preliminary open-end type survey sent to a sample of teachers in the region.

Data for the ten criteria used for evaluation of each program were also previously collected and available for this study. Schroeder had already collected scores for each criterion during the same year that Moeckel collected data for his study. Schroeder had data available for each of the programs that Moeckel used in his study.

# CHAPTER IV

## ANALYSIS OF DATA

A duplicated copy of the original questionnaires from which the data were secured can be found in appendix B. Data from each of the two groups of programs have been summarized on schedule A and schedule B.

### Comparison of Practices Used and Valued in the Unsuccessful and Successful Programs

It was found that 89 practices were used and rated of "much" value by half or more of the teachers from more effective programs.

The usage of practices from the various areas as categorized in the original questionnaire was quite consistently distributed throughout the thirteen headings for both groups. However, teachers from the more effective programs on the average used 101.2 practices while teachers with the less effective programs on the average used only 75.2 practices. Of the 101.2 practices used by teachers from the more effective programs, 67.8 were rated of "much" value. Of the 75.2 practices used by teachers from the less effective programs, 46.2 were rated of "much" value.

TABLE I

THE AVERAGE NUMBER OF PRACTICES USED AND VALUED BY TEACHERS IN THE MORE EFFECTIVE PROGRAMS AND BY THOSE IN THE LESS EFFECTIVE PROGRAMS

| | Teachers from More Effective Programs | Teachers from Less Effective Programs | Difference |
|---|---|---|---|
| Average number of practices used | 102.2 | 75.2 | 27 |
| Of practices used, average number rated of "much" value | 67.8 | 46.2 | 21.6 |
| Average number of practices used and not rated of "much" value | 34.4 | 29 | —— |

A total of 167 practices were listed on the original questionnaire.

## Classification of Practices

An attempt was made to discover practices used by a majority of the more effective group. Of these practices used by the majority, those were selected that were rated by half or more of the more effective group as possessing "much" value. This list of practices obtained from the more effective programs are ones that are used most often and valued most

highly by teachers with the more effective group of programs. Because these practices were used most often and valued most highly, they indicate that teachers of the more effective group considered the practices to be most effective in their adult-farmer program. Because these are select practices that were used and valued by the teachers and were associated with successful programs of adult-farmer classes, it is assumed that the practices may be effective.

The data from the less effective programs were summarized in exactly the same manner. The isolation of practices on the basis of usage and value by less effective programs does not, however, mean that these practices are effective or ineffective. They have been identified as being associated with the less effective programs so they can be compared with practices used and valued by the more effective adult-farmer programs.

Practices from the original questionnaire have been divided into the following categories: Practices Proven Best; Practices Proven Good; Possibly Good Practices; Unproven Practices that Show Promise; and Unproven Practices.

The "Practices Proven Best," were ones valued highly and used frequently by the more effective adult-farmer programs. These practices were called "Proven Best" by the author because they were used by 75 percent or more of the more effective programs and rated as possessing "much" value.

Because of the association of this group of practices with the more effective programs, the writer labeled these practices "Proven Best."

The "Practices Proven Good" were ones used by half or more of the more effective programs and rated as possessing "much" value by the majority of this same group. The author labeled this group of practices as "Proven Good" because of the association with the more effective programs. These practices differ from those "Proven Best" because slightly less of the teachers in more effective programs used the practices. The reader will note this difference by the presence of only one asterisk denoting "Practices Proven Best" in appendix C.

The "Possibly Good Practices" are ones that were valued more highly and used more frequently in the less effective programs than in the more effective programs. Less than half of the teachers of the more effective programs used this group of practices and/or less than half of them gave the practices a value of "much." Because of the high value given by teachers in the less effective programs and the significant association of these practices was with the less effective programs of adult-farmer programs, the author questioned the merit of the practices and categorized them as "Possibly Good."

The "Unproven Practices That Show Promise" were those that were not used by half of either group, but were given a value of "much" by half or more of those using the practices. These practices were categorized as "Unproven" because of the limited usage. The writer believes the practices have possibility because of the value placed on them by programs that used the practices.

The "Unproven Practices" are those that were used and given a value of "much" by less than half of both groups. The merit of these practices were not manifested through usage or value placed on them, thus they are called "Unproven."

## Practices Proven Best

The following list of practices are ones often used and highly valued by the more effective group of adult-farmer programs. These practices are considered as effective because of the association with effective programs. Some of these practices are also associated with the less effective programs, however this does not render the practices ineffective and useless. Because a program is not the most successful it does not mean that all the practices used in that particular program are poor ones. Even the most unsuccessful programs are known to use some excellent practices. Despite the

association of some of the following practices with poor programs, the author categorized this group of practices as "Proven Best."

1. Practices "Proven Best" are shown by the numeral "1" at the right of the stated practice because 75 per cent or more of the teachers in effective programs were using the practices and rated them of "much" value.

1a. If the "1" is followed by "a" a similar proportion of teachers with less effective programs used and valued the practices.

1b. If the "1" is followed by "b" from 50 per cent to 75 per cent of teachers with the less effective programs used and thought the practices of "much" value.

1c. If the "1" is followed by "c" less than half of the teachers with less effective programs used and/or thought the practices of "much" value.

<u>Administration and Policy</u>

| | |
|---|---|
| Avoid conflict whenever possible with all-day activities. | 1a |
| Keep superintendent and/or principal informed at all times. | 1a |
| Secure administrative approval for an adult program. | 1b |

<u>Public Relations</u>

| | |
|---|---|
| Use local paper to carry announcement of the program. | 1b |

## Planning a Program

| | |
|---|---|
| Offer "unit" courses, not a series of unrelated topics. | 1a |
| Plan a long-time program with a sequence of courses over a period of years, e.g., three to six years. | 1c |

## Planning the Instruction

| | |
|---|---|
| Interview class members or their farms regarding the content of the course. | 1a |
| Survey class members' interests to determine the content of the course. | 1a |
| Confer with business establishments regarding availability of specialists, teaching aids, etc. | 1b |
| Schedule slide films, movies, etc., in advance of the course. | 1c |
| Use consultants in planning the instruction. | 1c |

## Conducting the Classes

| | |
|---|---|
| Discuss proposed plans at the first meeting. | 1a |
| Use members in determining class objectives. | 1a |
| Conduct group discussion type meetings. | 1a |
| Base discussions on the problems of the members. | 1a |
| Use demonstrations. | 1a |
| Introduce class members at the first class meeting. | 1a |
| Use local data in class discussions. | 1a |
| Ask the members to come to the meetings with questions in mind. | 1a |
| Call class members by their first names. | 1a |
| Provide a seating arrangement so that all persons can see the faces of the others. | 1a |

| | |
|---|---|
| Have all-day pupils give demonstrations. | 1b |
| Use films, film strips, or some type of visual aid frequently. | 1b |

Conducting On-Farm Instruction

| | |
|---|---|
| Use field trips, tours, or field days. | 1b |
| Provide on-farm instruction while course is in progress. | 1b |
| Take helpful materials along on all field trips. | 1c |
| Provide bus transportation on field trips. | 1c |

Providing Teachers and Teacher Time

| | |
|---|---|
| Secure relief of school responsibilities for periods during the day. | 1c |

Supervising Special Teachers

| | |
|---|---|
| Observe their teaching. | 1c |
| Hold conferences with special teachers. | 1c |

Financing

| | |
|---|---|
| Ask members for donations for refreshments. | 1b |

Evaluating

| | |
|---|---|
| Use farm visits by the instructor. | 1b |
| Use check list of approved practices planned and adopted. | 1b |
| Conduct tours of farms of class members to observe practices. | 1c |
| Use time at the last meeting of the course for evaluation of the course. | 1c |

Social Activities and Special Features

Provide refreshments. 1a

Use class committee to conduct activities and special features. 1c

## Practices Proven Good

The following group of practices categorized as "Proven Good" were slightly less used and/or slightly less valued than those "Proven Best" by the teachers in the effective programs. The practices "Proven Good" are considered by the writer as effective practices that have much possibility.

2. Practices "Proven Good" are shown by the numeral "2" at the right of the stated practice because between 75 to 50 percent of teachers with good programs were using the practices and rated them of "much" value.

2a. If the "2" is followed by "a" 75 percent or more of teachers with poor programs used the practices and rated them of "much" value.

2b. If the "2" is followed by "b" between 50 and 75 percent of teachers with poor programs used and valued the practices.

2c. If the "2" is followed by "c" less than half of the teachers with poor programs used and/or rated the practices of "much" value.

Administration and Policy

Have superintendent and/or pricipal on the program at the last meeting, at recognition night, or at graduation exercises. 2c

Have policy statement regarding adult education from the board of education. 2c

Offer courses for any group requesting a course, e.g., adult-farmers, land-owners, farm women, businessmen, persons interested in farming. 2c

Coordinate meetings and courses with education programs of other agricultural education agencies. 2c

Public Relations

Notify public of administrative approval. 2c

Organizing Class Groups

Use leading farmer in recruiting members. 2a

Use an advisory committee to recruit membership in a class. 2b

Have high school student aid in recruiting members. 2b

Invite the whole community to special meetings of the course. 2c

Planning a Program

Offer courses for various groups on basis of needs, e.g., pork producers, grain producers, beef producers, corn producers, etc. 2b

Determine with the help of others the objectives of the adult-farmer program. 2b

Use an advisory committee or council. 2c

Planning the Instruction

Organize content on a seasonal basis. 2b

| | |
|---|---|
| Use other agricultural education agencies as consultants in planning the content of courses. | 2b |
| Integrate course content of high school and adult-farmer classes. | 2c |
| Confer with advisory committee. | 2c |

Scheduling and Locating Courses

| | |
|---|---|
| Conduct a course of ten to fifteen meetings a year. | 2c |
| Hold meetings in the high school only. | 2c |
| Conduct a course of ten meetings a year. | 2c |

Conducting the Classes

| | |
|---|---|
| Use technical experts as resource persons. | 2a |
| Ask direct questions of individuals. | 2a |
| Take time to summarize frequently. | 2a |
| Ask members of the class before meeting if they can present certain information to the class. | 2a |
| Provide table space for all members of the group. | 2a |
| Start and stop meetings on time. | 2a |
| Use class members to present demonstrations. | 2b |
| Give some information about each class member introduced. | 2b |
| Keep the opinion of the teacher out of the discussion until the ideas of all the group have been expressed. | 2b |
| Use local situations as examples. | 2b |
| Ask the group to weigh the possibilities of each idea introduced. | 2b |
| Have group analyze their discussions to see if it is accomplishing anything. | 2c |

| | |
|---|---|
| Start discussions with procedural question. | 2c |
| Ask provocative or controversial questions. | 2c |
| Give away educational materials at meetings like gestation charts, bulletins, etc. | 2c |
| Use farm records of class members as a basis for the content of courses. | 2c |

Conducting On-Farm Instruction

| | |
|---|---|
| Visit farmer enrollees before first meeting of the course. | 2a |
| Provide a definite system of on-farm instruction visits during the summer. | 2b |
| Help locate breeding stock and seed. | 2b |
| Promote demonstrations on the farm of class members. | 2c |
| Use class time to study the purposes of on-farm instruction. | 2c |
| Take key individuals in the community along on farm visits. | 2c |

Providing Teachers and Teacher Time

| | |
|---|---|
| Use class members for teaching whenever possible. | 2a |
| Secure the last periods of the school day for organization of an adult program and the visitation of class members. | 2b |
| Use special teachers. (persons not fully qualified as vo-ag teachers) | 2b |

Supervising Special Teachers

| | |
|---|---|
| Assist special teachers plan their instruction | 2c |

Evaluating

| | |
|---|---|
| Measure growth or decline in attendence. | 2b |
| Use on-farm meetings during the summer for evaluation. | 2c |
| Use advisory committee to evaluate the program. | 2c |
| Use other agricultural education agencies to evaluate program. | 2c |
| Use production records of class members. | 2c |

Social Activities and Special Features

| | |
|---|---|
| Provide recreational activities. | 2c |

Possibly Good Practices

The following practices are used more often and valued more highly by teachers in the less effective programs than by teachers in the more effective programs. This may mean that these practices are not significantly influencing program success. These practices may be actually hindering adult-farmer success because their association is closest to the less effective programs. However, it is the writer's judgment that these practices have some merit, but that they should be considered as "Possibly Good Practices."

3. "Possibly Good Practices" are shown by the numeral "3" at the right of the stated practice because less than 50 percent of teachers with the more effective programs used and/or rated the practices as having "much" value. But, teachers in the less effective programs were using the practices and felt that they had "much" value.

3a. If the "3" is followed by "a" 75 percent or more of teachers with the less effective programs used and rated these practices with a value of "much."

3b. If the "3" is followed by "b" 50 percent or more of teachers with less effective programs used and rated the practices as having a value of "much."

Public Relations

| | |
|---|---|
| Use circular letters or box holder postcards. | 3a |

Planning the Instruction

| | |
|---|---|
| Allow class members to select the course content from a prepared list of problems. | 3b |

Scheduling and Locating Courses

| | |
|---|---|
| Hold meetings in a rural school, church or other neighborhood location. | 3b |
| Never postpone or cancel a meeting. | 3b |

Conducting the Classes

| | |
|---|---|
| Use panel discussions. | 3b |
| Use forums. | 3b |
| Conduct "work shop" type meetings. | 3b |
| Pass out a discussion outline to help farmers stay on the subject. | 3b |
| Use questions, usually, that call for opinions not facts. | 3b |
| Assist in formulating plans of action. | 3b |

Have farmers indicate approved practices they will adopt. 3a

Conducting On-Farm Instruction

Give priority to the farmers needing the most help. 3b

Evaluating

Study (systematically) changes in attitude of class members and the community. 3b

Study regularity of attendence of members. 3b

Study enrollment to determine whom the program serves. 3b

Social Activities and Special Features

Award attendence diplomas. 3b

Unproven Practices That Show Promise

The following practices are categorized "Unproven," but show some promise of becoming popular and proven practices. Although less than half of both groups used these practices, the teachers that did use the practices placed a high value on them. It is the writer's opinion that effective practices may be unpopular in terms of usage, but they are likely to be valued by those using the practices.

4. "Unproven Practices That Show Promise" are shown by the numeral "4" at the right of the stated practice. Although these practices were used by less than 50 percent of both groups, 50 percent or more of those using the practices rated them with a value of "much."

Administration and Policy

Set maximum limits on class size. 4

Public Relations

Use local radio stations to inform public regarding program. 4

Use the school paper. 4

Planning a Program

Extend an important course such as soils or dairing over more than one year with the same group of farmers. 4

Organizing Class Groups

Provide membership or enrollment cards to those who enroll. 4

Have already organized group such as a community club sponsor a course or courses. 4

Hold meetings for wives concurrently. 4

Have members organize themselves and elect officers such as a president and a secretary. 4

Have roll call and check-up on absentees by a class committee or a class secretary. 4

Conduct courses in connection with some business establishment, examples; Welding by welding shop, butchering by food locker service. 4

Planning the Instruction

Use a "suggestion box." 4

Have members elect a class committee to plan the content of the course. 4

Postpone certain content in high school and young farmer classes until adult-farmer level. 4

Scheduling and Locating Courses

| | |
|---|---|
| Hold organized course meetings throughout a year. | 4 |
| Conduct two or more courses simultaneously (same meeting nights using special teachers). | 4 |
| Hold meetings only during the day. | 4 |
| Conduct a course of 15 to 20 meetings a year. | 4 |
| Limit discussion meetings to 90 minutes. | 4 |
| Limit shop meetings to 120 minutes. | 4 |

Conducting Classes

| | |
|---|---|
| Use speakers. | 4 |
| Use "buzz sessions." | 4 |
| Elect a discussion leader from the class. | 4 |
| Have farmers, who are non-class members, serve as discussion leaders. | 4 |
| Have class members, as many as possible, on some committee during a course. | 4 |
| Maintain suspense regarding the solution of the problem. | 4 |
| Provide members with written summaries of meetings. | 4 |
| Allow class members to smoke during class. | 4 |

Conducting On-Farm Instruction

| | |
|---|---|
| Provide on-farm instruction to class members only when requested. | 4 |
| Have class, as a group, visit each member's farming program. | 4 |

Financing

| | |
|---|---|
| Charge an enrollment fee. | 4 |

| | |
|---|---|
| Have class members purchase their own consumable supplies (e.g. farm plan book) | 4 |
| Allow farmers to "treat" each other as a means of providing refreshments. | 4 |

Providing Teachers and Teacher Time

| | |
|---|---|
| Hold meetings during the periods of the year when all-day classes are not in session (Thanksgiving, Christmas, spring and summer vacations) | 4 |
| Have a director of adult education in the school. | 4 |

Supervising Special Teachers

| | |
|---|---|
| Observe on-farm instruction of special teachers. | 4 |

Evaluating

| | |
|---|---|
| Use business men to evaluate the program. | 4 |
| Compare (systematically) results of class members with non-class members. | 4 |
| Compare (systematically) results of class members with standards, averages, etc. | 4 |

Social Activities and Special Features

| | |
|---|---|
| Have an achievement night. | 4 |
| Give special recognition to outstanding members. | 4 |
| Conduct a summer picnic. | 4 |

## Unproven Practices

The following practices are categorized as "Unproven" because they were used and valued "much" by less than half of either group of teachers. According to findings in this study,

these practices proved to be the least valued and the least used, thus they might be called the less effective or less successful practices. However, if used by more teachers or if the methods of using the practices were improved, the practice might have a higher rating.

5. The "Unproven" practices are shown by the numeral "5" at the right of the stated practices. These practices were used and valued "much" by less than 50 percent of the programs from both groups.

Administration and Policy

| | |
|---|---|
| Have superintendent and/or principal welcome class members at first meeting. | 5 |
| Inform other faculty members of the adult-farmer program. | 5 |

Public Relations

| | |
|---|---|
| Use posters or handbills. | 5 |

Planning a Program

| | |
|---|---|
| Use formal surveys. | 5 |

Organizing Class Groups

| | |
|---|---|
| Recruit members by announcements at athletic events, church activities, service clubs, etc. | 5 |

Scheduling and Locating Courses

| | |
|---|---|
| Hold meeting in homes of class members. | 5 |
| Hold some classes during the daytime. | 5 |

Conduct a courses of over 20 meetings a year. 5

Conducting Classes

Have a member or committee or members act as receptionists during the first two or three class meetings. 5

Use president or secretary of class to open meetings, and make announcements. 5

Use role playing. 5

Use an examination, not graded, near beginning of the course. 5

Use tape recordings of speeches made elsewhere. 5

Provide a class "evaluator" or "observer." 5

Use supervised study. 5

Record discussions on a tape recorder and play back. 5

Financing

Obtain donations from organizations and businesses for refreshments. 5

Have advisory committee members pay for refreshments. 5

Providing Teachers and Teacher Time

Use only special teachers who have teaching experience. 5

Use only special teachers with a college degree in agriculture. 5

Social Activities and Special Features

Use recreational movies. 5

Promote class organizations, such as cooperatives, work rings, etc. 5

# CHAPTER V

## SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

The purpose of this chapter is to present a brief summary of findings, some conclusions and recommendations.

### Summary

Of the 167 total practices listed on the original questionnaire, 37 were "Proven Best," 51 were "Proven Good," 16 were "Possibly Good Practices," 41 were "Unproven but Showed Promise," and 22 were "Unproven." The practices used by both groups were quite uniformily distributed throughout the 13 categories listed on the original questionnaire. The total practices used by teachers from the more effective programs were significantly more numerous than the total practices used by teachers with the less effective programs.

### 167 Total Practices

| | Average number of practices used | Average number of practices used and rated of "much" value. |
|---|---|---|
| By More Effective Group | 102.2 | 67.8 |
| By Less Effective Group | 75.2 | 46.2 |

The practices categorized "Proven Best" and "Proven Good" are those used and valued "much" by half or more of the more effective adult-farmer programs. The "Possibly Good Practices" are those that were used more often and/or valued more highly by teachers in the least effective programs than by teachers in the more effective programs. The "Unproven Practices That Showed Promise," are those that were used by less than half of either group, but were given a value of "much" by half or more of those using the practices. The "Unproven Practices" are those given a value of "much," by less than half of both the less effective or the more effective teachers of adult-farmers. They may have been used by more or less than half of the teachers in both groups.

## Conclusions

1. Some practices were used more often and valued more highly by teachers from the more effective programs than by teachers in the less effective ones.

2. There were practices that were used and valued more highly by the teachers in the less effective programs than by teachers in the more effective programs.

3. There are apparently a number of practices of "much value" which have not been generally used by teachers of adult-farmer classes.

4. There are a number of practices used generally by teachers of adult-farmer classes which have limited value.

5. The more effective programs used and valued considerably more practices than the teachers with the less effective programs.

6. Although the more effective programs used more total practices, the proportion of practices used from the various areas was quite consistent throughout the thirteen categories in the original questionnaire.

7. A few teachers use some practices that are not valued highly by those using them.

## Recommendations

1. The author recommends that adult-farmer teachers consider the findings of this study and explore the possibility of selecting "Proven Practices" for use with their respective programs.

2. Practices that are rated of "much value" but used by a small percentage of teachers show promise and should be tried more generally.

3. The "Unproven Practices That Showed Promise" should be further investigated after a larger group of the teachers in the successful adult-farmer programs have had an opportunity to use them.

4. Adult-farmer teachers should explore the possibility of replacing unproven and questionable practices that they may be currently using with "Proven" practices and practices that show promise.

5. A list of the "Proven Practices" should be devised in a form of a checklist for evaluation of practices used by adult-farmer teachers.

6. Some teachers should consider the possibility of using more practices.

# APPENDICES

# A STUDY OF EVALUATION IN ADULT EDUCATION IN VOCATIONAL AGRICULTURE

EXPLANATION--The purpose of this study is to determine criteria for a good program in vocational education in agriculture for adults and to determine useful evaluation practices used in such programs.

Please examine carefully the instructions that are given at the beginning of each section and supply the answers needed with the best available information from your 1951-1952 program.

Please return your reply at the earliest possible date in the enclosed envelope.

Name of school system _____

Name of respondent _____

Position held _____

Address _____ City _____ State _____

## PART ONE

## MEASURES FOR CRITERIA IN ADULT EDUCATION IN VOCATIONAL AGRICULTURE

Respond to each criterion measure as indicated. Base your responses on the 1951-1952 program.

### I. RELATIVE SIZE OF PROGRAM

Indicate in the space at the left the appropriate number for each of the following questions:

_____1. What was the total clock hours attendance for adult farmer activities conducted as a part of systematic instruction? Example--One man attending all two hour sessions of a 10 session course would have 20 clock hours attendance.

_____2. How many farmers are there in your community?

### II. RURAL CLIENTELE SERVED

Place an X before each segment served.

_____1. Young adult farmers (age 25-35)

_____2. Middle-aged adult farmers (age 35-55)

_____3. Farmers nearing retirement (age 55 up to retirement)

_____4. Retired farmers

_____5. Tenant farmers

_____6. Part-time farmers

_____7. Non-farming rural population

_____8. Farm leaders

_____9. City or village businessmen in related agricultural occupations

_____10. Farm owners not farming

_____11. Farm women

_____12. Foreign-born farm laborers

_____13. Native farm laborers

_____14. Workers in related agricultural occupations

_____15. Illiterates engaged in farming

_____16. Illiterates engaged in related agricultural occupations

III. FLEXIBILITY

Place an X before the one item in each section that describes the total program in your community.

A. Class activities were conducted during:

____1. Morning hours only
____2. Afternoon hours only
____3. Evening hours only
____4. Morning and afternoon
____5. Afternoon and evening
____6. Morning, afternoon and evening

B. Activities were conducted:

____7. 1 day per week
____8. 2 days per week
____9. 3 or 4 days per week
____10. 5 or more days per week

C. Activities were conducted in:

____11. 1 location
____12. 2 locations
____13. 3 to 5 locations
____14. 6 or more locations

D. Activities were scheduled during:

____15. 1 quarter of the year
____16. 2 quarters of the year
____17. 3 quarters of the year
____18. 4 quarters of the year

E. Continuous activities were scheduled for:

____19. 1 quarter of the year or less
____20. 2 quarters of the year
____21. 3 quarters of the year
____22. 4 quarters of the year

F. Activities were scheduled for a series of:

____23. 10 meetings per year
____24. 11 - 20 meetings per year
____25. 21 - 30 meetings per year
____26. 31 or more meetings per year

IV. RESULTS

Respond to each measure below by placing your answer in the space before each measure.

A. Give the average number of approved practices put into use per farmer in the program in:

____1. Farm management
____2. Marketing
____3. Soil and water conservation
____4. Livestock farming
____5. Crop farming
____6. Improved living on the farm
____7. Farm mechanics

____B. Give the number of cooperative buying and selling activities organized as a result of instruction in adult education in vocational agriculture.

____C. Give the number of cooperative organizations formed as a result of instruction in adult education in vocational agriculture.

____D. Give the number of farm organizations formed as a result of instruction in adult education in vocational agriculture.

____E. Give the number of farmers used as special teachers of adult classes.

____F. Give the number of farmers who helped to plan the instructional program in adult education in vocational agriculture.

____G. Give the number of other leadership activities assumed by class members.

____H. Give the number of community betterment projects which have been completed.

____I. Place an X before each item below where, as an outgrowth of instruction, improvement was noted in one or more persons.

____1. Dependability
____2. Scientific attitudes
____3. Fair play
____4. Broadmindedness
____5. Public problems
____6. Interest in farming
____7. Ability in self expression
____8. Literacy
____9. Home and family living
____10. Housing
____11. Recreation
____12. Sense of group unity
____13. Activities in the community
____14. Understanding of basic principles of farming

V. METHODS

What were the general methods used in your program?
Rate each item by using:

0 if seldom or never used
1 if occasionally or sometimes used
2 if ordinarily or usually used

____1. Courses were offered as a part of a series on one general subject.
____2. Courses were offered as separate units.
____3. Field trips were conducted.
____4. Radio broadcasts were given in content fields by the agricultural instructor.
____5. Radio-listening discussion groups were held.
____6. Television-viewing discussion groups were held.
____7. Workshops, short institutes or conferences were used.
____8. Courses were offered in cooperation with industrial, business and civic organizations.
____9. School-sponsored clubs were organized for adults.
____10. Guidance services were provided for adults.
____11. Certificates or diplomas were given for certain levels of accomplishment.
12. Classes were taught by:

____a. Agricultural instructor
____b. Worker from allied agricultural occupations
____c. Farmer
____d. Extension specialist under supervision of agricultural teacher

13. As a part of systematic instruction the following methods were used:

____a. Forum
____b. Lecture series
____c. Debate
____d. Symposium
____e. Panel
____f. Group discussion
____g. Demonstration
____h. Reports

VI. COORDINATION

What methods were used to coordinate the programs of adult education in vocational agriculture?
Rate each item by using:

0 if seldom or never used
1 if occasionally or sometimes used
2 if ordinarily or usually used

_____1. Advisory council for whole agriculture program

_____2. Informal group meetings with leaders

_____3. Informal meetings with individuals

_____4. A director (or coordinator) engaged by the public school

_____5. Examination of published literature of other agencies

_____6. Agreements defining the field of educational activity between the school and other agricultural agencies

_____7. A school policy defining the fields of educational activity of adult, young farmers and day school vocational agriculture and institutional on-farm training

_____8. Integration with total school adult education program

_____9. Other (specify)

VII. COOPERATION

What types of cooperation are practiced by your school with reference to other adult education agencies in your community and with reference to personnel in the school?
Rate each by using:

0 if seldom or never done
1 if occasionally or sometimes done
2 if frequently done

_____1. Cooperate with other agricultural agencies (other than public school) in planning and carrying out community wide education projects in agriculture such as grass day, farm face lifting, hay making demonstrations and soil conservation.

_____2. Cooperate with educational and community groups in the support of other worthwhile community projects, such as park improvement and clean-up campaigns.

_____3. Cooperate with other adult education agencies in the publication of an adult education directory with a listing and/or description of educational activities of each agency.

_____4. Interchange with non-school personnel as resource persons.

_____5. Make available the agricultural library in the school to rural community groups.

_____6. Inter-loan with non-school groups, such specialized equipment as cement mixers, movie and slide projectors and other similar items.

_____7. Cooperate with the institutional on-farm-training teacher in the school in planning and carrying out agricultural education programs.

_____8. Cooperate with the teacher of the young farmer group in the school in planning and carrying out programs of adult education.

_____9. Co-operate with the shop teacher(s) in the use of shop facilities.

_____10. Co-operate with all persons responsible for or involved in the total program of adult education in the public school in planning and carrying out educational activities in the school.

_____11. Cooperate with all persons responsible for or involved in the total school program in developing educational activities within the school and community.

VIII. ACTIVITIES MATERIALIZING

Indicate in the space at the left the appropriate number for each of the following questions:

_____1. How many courses were planned?

_____2. How many field trips and other activities were planned? (refer to section V)

_____3. Of the courses and activities listed in questions 1 and 2 above, how many actually started?

IX. MAINTENANCE OF ACTIVITY

Indicate in the space at the left the appropriate number for each of the following questions:

_____1. Of the number of courses and activities listed in question 3 of section VIII, how many were carried to completion?

_____2. Of the number of courses and activities listed in question 3 of section VIII, how many were combined because of declining attendance?

_____3. Of the number of courses and activities listed in question 3 of section VIII, how many held meetings in addition to those planned?

X. PERCENTAGE OF ATTENDANCE

_____ Indicate in the space at the left the percentage of attendance. Compute the percentage of attendance by totaling the average session attendance for all groups and classes and divide the sum by the total enrollment in the program.

PART TWO

PRACTICES USED IN EVALUATING ADULT EDUCATION IN VOCATIONAL AGRICULTURE

Rate each evaluation practice listed below according to the following rating scale:

0 if seldom or never used
1 if occasionally or sometimes used
2 if ordinarily or usually used

Base your responses on your 1951-52 program.

_____1. Clearly stated objectives are used to form the basis for evaluation.

_____2. A list is made of the kind of evidence needed to indicate that objectives are being met.

_____3. A list is made of the methods and devices to use in collecting evidence which will reveal that objectives are being met.

_____4. Evaluation occurs at specific intervals throughout the year.

_____5. Instruction is evaluated by analyzing check lists of approved practices planned and used.

_____6. A check of approved practices carried out is maintained on a chart.

____7. Production records of class members are used to indicate effectiveness of instruction.

____8. Part of the last meeting of the course is used for evaluation.

____9. Enrollment records are analyzed to determine the extent to which the program serves all who want, need or can use adult education.

____10. Attendance records are analyzed to determine regularity of attendance and the type of farmers who are attending.

____11. Change in attitude of class members is noted.

____12. Leadership development is noted.

____13. Co-operative activities developed are noted.

____14. Co-operative organizations formed are noted.

____15. Results of instruction with class members are compared with standards, averages, individual or other goals.

____16. Results of instruction with class members are compared with the economic and social achievement of non-class members.

____17. Progress is compared with progress of other years and progress in other communities.

____18. Systematic study of the community is made to discover changes in farming due to instruction.

____19. Practices used are observed on tours to farms of class members.

____20. Part of a special field day is devoted to evaluation.

____21. Part of an on-farm-meeting during the summer is used for evaluation.

____22. Pictures of "before" and "after" situations are used.

____23. Farmers and the teacher agree on the value of an approved practice.

____24. The instructor evaluates results of instruction as he visits the farms of the class members.

____25. Advisory committees assist in the evaluation of the program.

____26. Class members assist in the evaluation of the results of instruction.

____27. Business men assist in the evaluation of the program.

____28. Other teachers in the school, administrators, school board members, state supervisory staff and college or university education staff help evaluate the program.

____29. Other agricultural education agencies assist in the evaluation of the program.

____30. Plans and action are based on the analysis and interpretation of the results of evaluation.

| | More Effective Group | Less Effective Group |
|---|---|---|
| Use leading farmers in recruiting members. | * | xx |
| Invite the whole community to special meetings of the courses. | * | |
| **Planning the Instruction** | | |
| Schedule slide films, movies, etc., in advance of the course. | ** | |
| Confer with business establishments regarding availability of specialists, teaching aids, etc. | ** | x |
| Interview class members on their farms regarding the content of the course. | ** | xx |
| Survey class members' interests to determine the content of the course. | ** | xx |
| Organize content on a seasonal basis. | * | x |
| Use consultants in planning the instruction. | ** | |
| Integrate course content of high school and adult-farmer classes. | * | |
| Use other agricultural education agencies as consultants in planning the content of the courses. | * | x |
| Confer with advisory committee. | * | |
| Allow class members to select the course content from a prepared list of problems. | | x |

C (Continued)

## Scheduling and Locating Courses

| | More Effective Group | Less Effective Group |
|---|---|---|
| Conduct a course of ten to fifteen meetings a year. | * | |
| Hold meetings in the high school only. | * | |
| Hold meetings in a rural school, church or other neighborhood location. | | x |
| Conduct a course of ten meetings a year. | * | |
| Never postpone or cancel a meeting. | | x |

## Conducting the Classes

| | | |
|---|---|---|
| Discuss proposed plans at the first meeting. | ** | xx |
| Use members in determining class objectives. | ** | xx |
| Conduct group discussion type meetings. | ** | xx |
| Base discussions on the problems of the members. | ** | xx |
| Have all-day pupils give demonstrations. | ** | xx |
| Use demonstrations. | ** | xx |
| Introduce class members at the first class meeting. | ** | xx |

C (Continued)

| | More Effective Group | Less Effective Group |
|---|---|---|
| Use class members to present demonstrations. | * | x |
| Use technical experts as resource persons. | * | xx |
| Give some information about each class member introduced. | * | x |
| Use local data in class discussions. | ** | xx |
| Ask the members to come to the meetings with questions in mind. | ** | xx |
| Call class members by their first names. | ** | xx |
| Provide a seating arrangement so that all persons can see the faces of the others. | ** | xx |
| Use films, film strips, or some type of visual aid frequently. | ** | x |
| Have group analyze their discussions to see if it is accomplishing anything. | * | |
| Start discussions with a procedural question. | * | |
| Ask direct questions of individuals. | * | xx |
| Ask provocative or controversial questions. | * | |
| Keep the opinions of the teacher out of the discussion until the ideas of all the group have been expressed. | * | x |
| Take time to summarize frequently. | * | xx |

C (Continued)

| | More Effective Group | Less Effective Group |
|---|---|---|
| Ask members of the class before meeting if they can present certain information to the class. | * | xx |
| Use local situations as examples. | * | x |
| Give away educational materials at meetings like gestation charts, bulletins, etc. | * | |
| Provide table space for all members of the group. | * | xx |
| Start and stop meetings on time. | * | xx |
| Ask the group to weigh the possibilities of each idea introduced. | * | x |
| Use farm records of class members as a basis for the content of courses. | * | |
| Use forums. | | x |
| Use panel discussions | | x |
| Conduct "work shop" type of meetings. | | x |
| Have farmers indicate approved practices they will adopt. | | xx |
| Pass out a discussion outline to help farmers stay on the subject. | | x |
| Use questions, usually, that call for opinions not facts. | | x |
| Assist in formulating plans of action. | | x |

C (Continued)

Conducting On-Farm Instruction

| | More Effective Group | Less Effective Group |
|---|---|---|
| Use field trips, tours, or field days. | ** | x |
| Take helpful materials along on all farm visits. | ** | |
| Provide a definite system of on-farm instruction visits during the summer. | * | x |
| Provide on-farm instruction while course is in progress. | ** | x |
| Provide a bus for transportation on field trips. | ** | |
| Promote demonstrations on the farm of class members. | * | |
| Visit farmer enrollees before first meeting of the course. | * | xx |
| Help locate breeding stock and seed. | * | x |
| Use class time to study the purposes of on-farm instruction. | * | |
| Take key individuals in the community along on farm visits. | * | |
| Give priority to the farmers needing the most help. | | x |

Financing

| | | |
|---|---|---|
| Ask class members for donations for refreshments. | ** | x |

C (Continued)

| | More Effective Group | Less Effective Group |
|---|---|---|

VT 005 463
Matthews, Ralph W.
Guideline for Cooperative Education Coordinator.

Alaska State Dept. of Education, Juneau. Div. of Vocational Education
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 67 54p.

*COOPERATIVE EDUCATION; *GUIDELINES; *INSTRUCTOR COORDINATORS; *PROGRAM GUIDES

Cooperative education is a program developed jointly by the school and business or industry to develop the skills and job adjustment through an organized sequence of job experiences in paid part-time employment and through classroom experiences in related instructions in (1) business and office, home economics distribution, and trade and industrial occupations, (2) off-farm agriculture, (3) interrelated occupational combinations, and (4) special purpose training. An explanation and suggestions for implementation are given for guidelines covering: (1) duties and responsibilities of the cooperative education coordinator, (2) guidance and counseling function of the school, (3) development of student personnel records, (4) characteristics and qualifications of the teacher-coordinator, (5) preparation and certification of teacher-coordinator, (6) a plan for initiating and organizing a cooperative program, (7) local school policies relative to cooperative education, (8) advisory committees, (9) public relations activities, (10) teaching facilities, (11) inschool instruction, (12) on-the-job instruction, (13) training evaluation, and (14) legal responsibilities. A yes-no check list is provided as a guide to evaluate the program. (PS)

The concept of cooperative education in vocational and technical education is certainly not new. However, recent trends in the world of work and in education provide compelling reasons for "sharpening our concepts and broadening our perspective and application of this methodology to more occupational training areas and to different levels of preparation.

The overall objective of the Cooperative Education Coordinator is to promote and expand the use of the principle of Cooperative Education by all the vocational services and through an inter-service effort to explore the possibilities of providing training for youth preparing for new and emerging occupations which require knowledge and skills from several vocational disciplines. Examples of new and emerging occupational areas include turf management, data processing, child care service, garden center management, pre-sold merchandising operations, nursing and rest home service, outdoor recreational service, supervisor of communications services, electromechanical service, and repair, automatic merchandising, etc.

The duties of the Cooperative Education Coordinator are not to supplant duties instructors engaged in Cooperative Education, but focused on the cooperative education problems of all the vocational disciplines that are focing vocational education staff, school administrators, the local community, business and industry, management, and unions.

Ralph W. Matthews
Acting Director
Vocational Education

## PART I INTRODUCTION

### The Challenges Before Vocational and Technical Education

The most affluent society in the world, the United States, is facing the challenges of unemployment, underemployment, and poverty. Meeting these challenges, we have developed the most advanced technology known to man in the fields of agriculture, business, industry, and the home. But a paradox exists, not enough people are trained to operate, service, rebuild, and develop this mushrooming technology. In addition, there is a need for skilled people to supervise and manage employees. These employment needs combined with the demands of the military establishment present a major challenge to all agencies concerned with education and training of workers. In the October, 1964 issue of the N.E.A. Journal, J. Chester Swanson summarized the challenge to education: "Our political and social survival may depend to considerable extent upon our ability to provide for the adequate employment of our nation's youth. Although the unemployment problem is so big that it must be approached from all angles, vocational education can play a considerable part in providing a solution."

Dr. Swanson defined vocational education "as that part of a school curriculum or those on-the-job activities designed to provide the skills and knowledge which will enable the student to obtain employment or to become a more proficient worker in providing economic security for himself and his family."

Cooperative education can make a substantial contribution toward meeting this unemployment problem. Cooperative education can furnish our most promising hope for a substantial increase in occupational, vocational and technical education at the secondary level.

Expanding Cooperative Education

Cooperative education in operation for over fifty years can be introduced into many more programs without a substantial outlay of local money. Realistic learning for thousand of young people now enrolled in comprehensive high schools, vocational-technical area schools, technical institutes, and community colleges can come through cooperative education. Its wide and favorable acceptance by leaders in education, business, and industry is based upon a constructive and functional educational philosophy. Finally, in-school instruction and on-the-job training in a cooperative program can lead to full-time employment for the student-trainee after graduation from high school. Federal funds, available through the Vocational Education Act of 1963, have prompted states and local communities to develop new programs and improve existing programs in cooperative education.

Cooperative education is a well-developed instructional program which requires a teacher-coordinator to organize the learning activities of student-trainees around their career interests and goals. He coordinates classroom instruction with on-the-job experience. While on the job, student-trainees learn to work with adults and to develop the essential attitudes of respect and responsibility. School administrators, parents, and employers all know that cooperative education can help train young people in a wide variety of occupations. Even students realize the usefulness of cooperative education.

The number and the kinds of cooperative programs have increased in number in recent years. Yet, many communities have not utilized this practical learning approach. The educators in these communities should review the

advantages of cooperative education for the student, school, employer, and community so that the educational needs of the people can be met.

## Plan for the Future

According to the Panel of Consultants on Vocational Education, eight out of ten youngsters now in grade schools will not complete college. This need for practical and meaningful programs to satisfy the educational requirements of those who do not complete college can be met by providing a wide range of learning opportunities for students in every ability level. When learning opportunities are increased the number of drop-outs should be reduced. Learning opportunities can be increased in a program which includes:

1. A complete guidance program which includes a survey of interests, counseling, testing, and adequate school records.

2. A solid foundation of general education to serve as the base for specialized instruction for an occupation or profession.

3. An adequate program of industrial arts, home economics, general business, and general agriculture to provide realistic exploratory experiences in all major fields of employment.

4. A complete program to develop the pre-employment skills required in the agricultural, home economics, office procedures, sales and service vocations, and industrial occupations.

5. An adequate cooperative education program to assist young people to enter productive employment.

It is obvious that we need an expansion of all types of "practical" education to meet the varied needs of young people. In most situations, it is not enough to have one or two cooperative programs in a comprehensive high

school. We need a total vocational program in which the cooperative phase is only a part.

## Interrelated Services Important

In the years ahead we should give more attention to the ways and means of utilizing all the vocational services to satisfy the educational needs of youths and adults. Attention should be given not only to the expansion of existing programs of agricultural, distributive, trade and industrial, office, and home economics education, but also to the development of new instructional patterns which can interrelate course content from two or more vocational disciplines. The emphasis, therefore, should be less on course content and more on the job needs of the student so that he can perform effectively on the job. For example, if a trade and industrial student learning the skills of automotive service needs instruction in selling, provision should be made to teach him the selling skills. If a distributive education student needs instruction in office operation, instruction in office skills should be provided. Numerous interrelation exist between sales, service, production, and distribution. The principal ingredient needed to bring about a strong program of interrelated services is "cooperation" and a vital concern for the development of a functional program of vocational and technical education.

## Investment in Individual Development

All education is an investment in the development of the whole individual. Better educated people make a substantial contribution to the work force because they:

1. learn more and earn more;

   produce more and achieve more;

3. require fewer tax supported public services;

4. have more information and facts upon which to base important decisions;

5. adapt more readily to new developments and new ideas and new methods;

6. appreciate and buy more new products and services;

7. have more faith in a free market economy and our competitive economic system;

8. participate more in representative government.

On the other hand, the uneducated are often dependent upon society for the bare necessities of life, which affects the economy of their community.

## Description and Objectives of Cooperative Education

### Distinction Between Work-Experience Programs and Cooperative Education

In the minds of some people cooperative education is not greatly distinguished from work-experience education. A fairly clear differentiation can be made.

Work-Experience education has a number of diffuse, general objectives. For example, work experience has been introduced in a variety of worthwhile educational programs conducted for various purposes and in different forms. These programs would be individually defined according to their nature, purpose, procedures, and substance and range from efforts to propose new approaches to curricula.

The cooperative program, which also contains the element of work experience, is specifically defined. It is a program of vocational education developed jointly by the school and business or industry in which job skills and job adjustment are secured through an organized sequence of job experiences in paid part-time employment and through classroom experiences in related instruction.

Uniquely, cooperative education helps the student to:

1. Select an appropriate field of work or an occupation;

2. Learn skills of an occupation under actual conditions of employment and production;

3. Gain technical and related information which will enable the learner to engage in the work of the chosen occupation intelligently, safely, and confidently;

4. Make adjustment to the real employment setting including responsibilities, relations with other workers, and acceptance of supervision;

5. Make optimal application of school learning to a vocation and of job learning to school work;

6. Learn to assume adult responsibilities in work, in relation to peers, and in his community.

## Seven Types of Cooperative Programs

1. <u>Cooperative Programs in Business and Office Education</u>

Cooperative office programs provide classroom instruction and on-the-job training to develop vocational competency in office skills, knowledges, and understandings. These programs are intended to prepare the student for initial employment and for advancement on the job. Given prior to the time of employment at a training station, the instruction includes courses such as typewriting, shorthand, transcription, bookkeeping, and machine operation. During the time of training-station employment, the student's classroom work includes directly related instruction such as office procedures, which includes clerical procedures; calculating, duplicating, and transcribing machines; filing; cashier, sales, purchases, payroll, and stockroom procedures; and business correspondence and other communications.

2. Cooperative Programs in Distribitive Education

Cooperative programs in distributive education are designed to prepare students for entry occupations and for promotion to positions of increased responsibility in the various areas of marketing, including wholesaling, retailing, and service industries. The programs take several forms, but most commonly, the students are employed at training stations on a half-day basis during their senior year in high school. In some cases the necessary courses in marketing and salesmanship are completed in the junior year as pre-employment classes, followed by related instruction and on-the-job training in the senior year.

Senior high school programs primarily utilize retail store training placements. Post-high school and community college programs use wholesale businesses, big-ticket departments of retail stores, and direct sales placements.

3. Cooperative Programs in Home Economics

In home economics, increased emphasis is now being placed on program development specifically geared to preparing students for employment. Typical occupations for which cooperative home economics programs are used include the food service area, clothing maintenance, hotel and motel service, and child care. The main objectives of cooperative education efforts in home economices are: to prepare students to obtain specific jobs using the technical skills of home economics; to assist students in developing personal characteristics that are necessary in the world of work; to alert students to the possible job opportunities in the home economics

field; and to help business and industry become aware of the assistance that the school can give through cooperative job training in home economics related occupations.

4. Cooperative Programs in Trade and Industrial Education

Cooperative programs in industrial education are designed to prepare students for entry jobs in the skilled trades or other skilled industrial occupations.

The in-school phase involves instruction in both general employment information common to all vocations and trade theory which is applicable to the occupation or trade in which the student is employed. The emphasis is on the acquisition of specialized skills and knowledge needed for trades which demand in-depth instruction. These programs are sometimes called Diversified Cooperative Training (D.C.T.) or Industrial Cooperative Training (I.C.T.) because the students in one class are employed in training stations representing several different trades.

In some large cities or in area schools, instruction may be organized according to trade areas or by occupational families, e.g., automotive, drafting, and printing. In these schools the teacher-coordinator may teach the pre-vocational (sometimes called pre-employment) classes or tenth grade shop and the related technical information for those who are employed on a cooperative job. Under this plan the vocational drafting teacher-coordinator world teach the tenth year pre-vocational students two or three periods and the eleventh or twelfth year employed students one period each day. An important part of the school day must be devoted to on-the-job

coordination. Usually such programs follow the alternating plan where the student is in school one, two, or three weeks and on the cooperative job a similar period.

Cooperative programs in industrial education may be suggested for those who wish to pursue a college major in industrial education; those who plan to enroll in industrial or technical programs on the post-high school level; and those who want to work full time immediately following high school graduation.

5. Cooperative Off-Farm Agriculture Programs

There are many occupations in which agricultural competencies are needed in addition to farming. Examples include: elevator operations, farm equipment, feed and fertilizer sales, farm produce, and livestock brokeage operation. On-the-job, supervised occupational experiences can be one of the answers to providing competent people for their entry into agriculture-related off-farm occupations. Provisions of the Vocational Education Act of 1963 have increased the number of schools providing programs of this type; these can be developed for area schools and community colleges as well as local high schools.

6. Combination of Interrelated Cooperative Programs

In many communities, cooperative programs are in operation which involve students employed in several vocation fields, including the office distributive, trade and industrial, off-farm agricultural, and home economics-oriented occupations. In some states these programs are called diversified vocational programs. In other states these are called cooperative occupational education

programs. Programs of this type are best suited to small high schools in rural areas where there are neither enough students nor enough acceptable training stations in single occupational areas to justify separate programs.

Although interrelated or diversified programs embody the basic principles common to all cooperative education programs, some special problems do exist. To operate a program that is truly vocational cooperative, directly related instruction in the classroom must be coordinated with the on-the-job experiences. The coordinator must be familiar with and have had work experience in several vocational fields. In addition there is the problem of developing and using the great variety of individualized instrutional materials that must supplant the usual group methods used in specific or unit type programs.

7. Special Purpose Programs

As school administrators learn more about the advantages and the operating details of cooperative education, we will see more special purpose programs developed. An example of this type may be found in a specialized program organized to train gasoline station attendants. Such programs involve instruction from the trade and industrial field as well as sales and service. It is also advisable to include recordkeeping, typing, or smilar business office skills.

"Special purpose" cooperative programs might be considered for physically handicapped, retarded, and inter-city youth.

## Common Elements in All Cooperative Education

A major thesis of these guidelines for cooperative education is that a great commonality exists in vocational cooperative programs. The overriding purpose is to develop occupational competence through classroom work carefully coordinated with on-the-job experiences.

Many other concepts are an integral part of cooperative education. These include (1) paid employment whereby the student-employee experiences are that of a full-fledged employee rather than as an observer or aid, (2) the employment of a teacher-coodinator especially trained in coordination techniques with experiences in the vocational fields for which he is responsible for instructing and guiding a student-trainee, and (3) the use of consulting or advisory committees in order to bring joint thought and planning to bear on school and community problems.

Business and distributive fields are being combined with agriculture to develop many fine agricultural business cooperative programs. In several places around the country, home economics programs are being developed in connection with other service areas. This adheres to the "student centered" approach which is inherent in the Vocational Education Act of 1963 and can probably be the area in which cooperative education will make its greatest contribution to the further development of a total program of vocational and technical education.

## Definitions Relating to Cooperative Education

The following definitions will help to clarify the meaning of terms relating to cooperative education:

ADVISORY COMMITTEE - a group of persons, usually outside the educational profession, selected for the purpose of offering advice and counsel to the school regarding the vocational program. Members are representatives of the people who are interested in the activities with which the vocational program is concerned. (See also Craft Advisory Committee.)

COOPERATIVE EDUCATION - a program for persons who are enrolled in a school and who, through a cooperative arrangement between the school and employers, receive part-time vocational instruction in the school and on-the-job training through part-time vocational instruction in the school and on-the-job training through part-time employment. It provides for alternation of study in school with a job in industry, agriculture, home economics related, or business, the two experiences being planned and supervised by school and employer so that each contributes definitely to the student's development in his chosen occupation. Work periods and school attendance may be on alternate days, weeks, or other periods of time, but the hours at work are during the school day and equal or exceed the hours spent in school during the regular school year. This plan of training is used extensively in various phases of vocational education.

COORDINATING TEACHER (TEACHER-COORDINATOR) - a member of the school staff who teaches the related and technical subject matter involved in work-experience programs and coordinates classroom instruction with on-the-job training.

COORDINATOR (COOPERATIVE EDUCATION) - a member of the school staff responsible for administering the school program and resolving all problems that arise between the school regulations and the on-the-job activities of the employed student. The coordinator acts as liaison between the school and employers in programs of cooperative education or other part time training.

CRAFT ADVISORY COMMITTEE - a group of local craftsmen, selected from a specific trade or occupation, appointed to advise the school on matters pertaining to teaching the particular occupation. Generally, the committee should include an equal number of representatives of labor and management.

DIVERSIFIED OCCUPATIONS PROGRAM - a high school course in which students are given supervised work experience in any one of a variety of occupations, combined with related classroom instruction. This type of program is suited especially to communities where the need for workers is too limited to justify separate courses for each occupation. This program is usually under the direction of the trade and industrial education division and supervised by a teacher-coordinator.

ON-THE-JOB TRAINING - instruction in the performance on a job given to an employed worker by the employer during the usual working hours of the occupation. Usually the minimum or beginning wage is paid.

WORK EXPERIENCE - employment undertaken by a student while attending school. The job may be designed to provide practical experience of a general character in the work-a-day world.

WORK EXPERIENCE EDUCATION (OCCUPATIONAL EXPERIENCE) - employment undertaken as part of the requirements of a school and designed to provide planned experiences, in the chosen occupation, which are supervised by a teacher-coordinator and the employer.

WORK STUDY PROGRAM - administered by the local educational agency and made reasonably (to the extent of available funds) to all eligible youths in the area served by such agency. Employment under the program may be for the local educational agency or some other public agency or institution and will be furnished only to students who (a) have been accepted for enrollment as full-time students in an approved vocational education program, (b) need earnings to continue their vocational education, and (c) are at least 15 and less than 21 years of age. No student shall be employed under the program more than 15 hours in any class week or paid more than $45 in any month or $350 in any academic year, except in special cases.

GUIDELINE NO. 1

Duties and Responsibilities of the Cooperative Education Coordinator

Guideline

The duties and responsibilities of cooperative education coordinator should be defined in terms of the objectives and policies of cooperative education.

Explanation

The nature and extent of the cooperative education coordinator's duties responsibilities involve skills in planning, counseling, teaching, placing, and supervising students in training stations, and making follow-up studies to evaluate the student's performance.

The cooperative education coordinator's duties are so varied that he should develop a daily schedule to help him complete his work. Such a schedule will provide evidence to the school administration that the assigned coordination time has been well spent.

Implementation

1. Budget--Assist in preparing the cooperative education budget.
2. Advisory Committee--Meet and work with a Cooperative Education Advisory Committee.
3. Community Survey--Conduct a community survey to ascertain local training needs.
4. Public Relations--Inform faculty, students, and community about the program.
5. Reports--Assist in submitting necessary local and state reports.
6. Selection of Training Stations--(a) Find local employers who will cooperate with the school in training students and (b) develop for each student a training plan in cooperation with his on-the-job supervisor.

7. Training Agreement--Obtain agreement and signatures to the training agreement by student, employer, school representative, and parents.

8. Related In-School Instruction--(a) Provide general and specific related instruction for student-trainees in at least one school period daily; (b) coordinate in-school instruction with the students' on-the-job experience; and (c) provide organized instructional materials for specific related phases of the students' related instruction.

9. Appointment Schedule--Should develop and file an itinerary providing information where he may be reached.

10. Employer Conferences--Confer with students' on-the-job supervisor at regular intervals to check students' progress.

11. Youth Group Activities--Organize co-curricular activities for youth enrolled in Cooperative Education.

12. Public Relations--See Guideline 9

13. Self-Improvement--Attend professional workshop and conferences.

14. Participation in Professional Organizations--Maintain active membership in professional organizations.

15. Follow-up Studies--Conduct regular follow-up studies of co-operative education graduates.

## Guideline No. 2

## Guidance and Counseling Function of the School

### Guideline

The guidance and counseling program should assist cooperative education students in choosing and following suitable training objectives.

### Explanation

Guidance services are involved in nearly every phase of the cooperative education program. Although there should be cooperation between the guidance counselor and the teacher-coordinator, the primary responsibility of enrollment, placement, and follow-up rests with the teacher-coordinator. His effectiveness is evaluated in terms of successful training and adjustment of the students in his program.

### Implementation

1. Effective Counseling--The guidance counselor and teacher-coordinator should help each student to recognize his special interests and aptitudes through an interpretation of his school records, background, and his inventory and test profile.
2. Selection of Students--The teacher-coordinator should work closely with the guidance counselor in the selection of students for the cooperative program.
3. Enrollment Procedure--The enrollment procedure should be well defined and understood by all concerned. They should know the factors which determine student selection and placement.
4. Parental Approval--The teacher-coordinator should confer with parents about the factors relating to vocational choice and career planning.

5. Periodic Counseling--The teacher-coordinator should review periodically with the students their (a) career objectives, (b) achievement in relationship to aptitude and ability, (c) personal and social development, and (d) job performance record.

6. Job Placement--The teacher-coordinator should maintain a current file of job opportunities available to graduates.

7. Follow-Up--The teacher-coordinator should maintain a follow-up file of the graduates from the cooperative education program.

## GUIDELINE NO. 3

### Development of Student Personnel Records

Guideline

The student personnel records should contain the kinds of information needed by the teacher-coordinator for conducting a cooperative education program.

Explanation

The personnel record is the central source of important information about the students. It contains personal data, scholastic information, test results, extra-curricular participation, career objectives, and job training experience. It is of great value to the school administration in planning a school program that will meet the needs of the students enrolled; to the teacher-coordinator who assumes the multiple roles as teacher, counselor, placement director, and employment supervisor; and to the guidance counselor who will need data to assist in effective counseling.

Implementation

1. Personal Data--Personal data should include: (a) the name, nickname, home address, sex, date and place of birth of the student; (b) the names, addresses of parents, or guardian, their birthplace, marital and educational status; (c) the names and ages of brothers and sisters; (d) a summary of health information including hearing, sight, speech, disabilities, and immunization data of the student.
2. Scholastic Information--The scholastic information typically includes school attendance beginning in the elementary grades and grades earned.
3. Test Results--Test results should contain information about achievement, interests, aptitudes, and mental maturity.

4. Extra-Curricular Participation--The record should include information about the student's participation in school activities, athletics and out-of-school functions, including offices held, honors, and other special awards. It should also record interests, noteworthy attributes, and special skills of the student.

5. Career Objectives--The student's future and intermediate goals should be reported.

6. Job-Training Experience--The teacher-coordinator should be familiar with the complete record of each student. He should add information about the student's adjustment on the cooperative job, family visits, placement information, and a follow-up record.

## GUIDELINE NO. 4

### Characteristics and Qualifications of the Teacher-Coordinator

Guideline

A teacher-coordinator should have the personal and professional qualifications needed to organize, administer, and conduct an effective cooperative education program.

Explanation

To be successful, a teacher-coordinator must establish goals worthy for self-improvement. He must also be constantly aware of the relationships that are inherent in the teacher-student learning situation.

Teacher-coordinators should bring to their jobs the required experience and training. In every instance they should supplement their employment experience and teaching and counseling skills with continuous in-service improvement.

Implementation

1. Formal Education--He should have completed a bachelor's degree or the equivalent as a minimum professional requirement.
2. Employment Experience--He should have employment experience closely related to the occupations represented in his cooperative program. Some authorities recommend two or more years. A variety of employment experience should be required of a coordinator of a diversified cooperative program.
3. Purposeful Outlook--He should have a sincere desire to assist young people in developing into competent employees.
4. Skill as a Teacher--He should have a record of successful teaching experience and a desire to further perfect his teaching skills.

5. Role as a Teacher--He should constructively relate the cooperative program to other areas of basic instruction in the total school program and to teach what is needed when it is most meaningful to the student.

6. Role as a Teacher-Coordinator--He should be thoroughly conviced of the importance of his role as teacher-coordinator.

7. Personal Traits--He should be prompt, respectful, courteous, sympathetic, and consistent in all of his dealings. He must also be a good organizer not only of instruction but also of records, reports, and other details of the program.

8. Knowledge of Job Requirements--He should be familiar with job requirements, lines of advancement, and the job competencies required for each level of advancement.

9. Extra-School Duties--He should reflect an attitude of helpfulness and with other members of the faculty be willing to assume extra-school duties.

10. Physical and Mental Stamina--He should have sufficient physical and mental stamina to discharge his duties effectively.

11. Public Relations--He should be able to maintain effective public relations for the cooperative education program.

## GUIDELINE NO. 5

### Preparation and Certification of Teacher-Coordinators

Guideline

All teacher-coordinators should have adequate preparation and meet certification standards established by the appropriate state agency.

Explanation

Certification requirements for teacher-coordinators should be similar for all service areas in vocational education. The common elements found in all cooperative programs should be emphasized.

Some states require that specified courses be completed before an applicant will be considered for the teacher-coordinator's position. Other states permit certified teachers who are preparing to be teacher-coordinators to take some required courses in pre-service workshops during the summer months and other required courses through in-service study concurrent with employment.

Implementation

1. Certification Requirements--Certification requirements should be based on the needs of the teacher-coordinator as a result of job analysis. They should also define the prerequisite teaching and employment experience.
2. Teacher Education--The teacher education program to prepare the teacher-coordinator for certification should include:
   a. the principles, practices, and philosophy of vocational and technical education, and
   b. curriculum development, survey techniques, a study of recruitment, student selection and counseling, placement and follow-up of trainees, job analysis, job adjustment,

methods of individual and group instruction, and student and program evaluation.

3. In-service Improvement--In-service education to improve the effectiveness of the teacher-coordinator should be provided by colleges and universities in cooperation with the state department of education.

4. Follow-up of New Coordinator--Representatives from the teacher-education institution and the state staff should follow up the new teacher-coordinator and provide assistance in setting up or adjusting to the cooperative program.

5. Cooperative Education Workshop--The state operating manual for vocational education should provide for at least one cooperative education workshop a year involving the teacher-educators, state supervisors, local supervisors, teacher-coordinators, and administrators.

6. Recruitment of Teacher-Coordinators--The local school and the teacher education institution should work together in the recruitment and training of prospective teacher-coordinators.

GUIDELINE NO. 6

A Plan for Initiating and Organizing a Cooperative Program

Guideline

The procedures for developing a cooperative education program should be outlined in a written plan.

Explanation

The educational values of cooperative education, rather than the earnings, should be stressed with the superintendent, principal, counselors, employers, and members of the advisory committee.

A sequence of activities should give direction when organizing a new cooperative education program. The sequence should vary with the type of community and program. Few of the steps listed below can be eliminated without jeopardizing the program. (Many of the steps will be discussed in more detail elsewhere in this manual.)

Implementation

1. Establishment of the Need and Value--Draw up a statement of the need for a cooperative education program with supporting evidence.
2. Local and State Support--Organize a steering committee made up of school personnel (including counselors and the administration's representative) to plan the organizational procedures.
3. Steering Committee--Activities and responsibilities follow:
   a. Define the purpose and plan of the proposed program.
   b. Develop an outline of activities to start the program.
   c. Follow administrative policies and procedures established by the school system.
   d. Develop the student selection criteria.

e. Determine the need for teaching facilities and office space to be used by the coordinators.

f. Decide on the nature of the in-school instruction plan and schedule.

4. School Administration Approval--Obtain approval of training plans and operating details from the school administrators.

5. Approval of Board of Education--Secure the approval of the board of education to conduct the cooperative program.

6. Feasibility Study--Conduct a feasibility study to determine employer interests, employment opportunities, and student interests.

7. Employment of Teacher-Coordinator--Report to the board of education on the local survey and secure their approval to employ a qualified teacher-coordinator.

8. Advisory Committee--Establish an advisory committee to review the policy statement and the operating details for the administration of the program. (See Guideline 8.)

9. Faculty Support--Explain the plans for cooperative education to the school faculty.

10. Public Relations--Develop a public relations program in the school and community.

11. Instructional Facilities and Equipment--Arrange for instructional facilities and equipment.

12. Student-Trainee Recruitment--Encourage interested students to apply for admission into the cooperative education program and select the students.

13. Counseling--Explain the details of the program operation to the students selected and prepare them for the job application, employment

interview, and job placement.

14. Training Stations--Inform prospective employers about the program and select the training stations.

15. Training Agreement--Develop a standard training agreement to insure progress on the job and adequate learning experiences.

16. Safety Practices--Check at the training stations for possible safety hazards to the student-trainee.

17. Maintenance of Records--Maintain placement records for review by the advisory committee and school administrators.

18. Establishment of a Schedule for Supervision and Coordination--Establish a schedule of supervision with an adequate allowance of coordination time.

19. Evaluation of Students' Performance--Fill in student evaluation forms and discuss them with students and employers.

20 Related Instruction--Provide related instruction in keeping with training agreements.

21. Co-Curricular Activities--Prepare basic plan for organizing the student club program.

22. Evaluation of the Program--Provide for evaluation of the program by means of a follow-up of the students. (Also, see Guideline 13.)

## GUIDELINE NO. 7

### Local School Policies Relative to Cooperative Education

Guideline

Local schools should develop operational policies for their cooperative education programs.

Explanation

The establishment of relistic standards, in the local cooperative education programs, will simplify the job of the teacher-coordinator as he explains the details of the program to fellow teachers, guidance counselors, parents, and employers. These standards can contribute to a healthy program and help develop relationships with individuals and groups.

These operating guidelines should be reviewed every two or three years by the advisory committee. If the committee recommends changes, these should be discussed with the superintendent, principal or others who may have administrative responsibility for policy making.

State manuals define minimum standards, but local standards may be established above state minimum standards to provide for unique situations peculiar that community.

Implementation

1. Use the state operating manual as the guide for preparation of local school policies.
2. Have the local steering committee review the local school policies and standards for the cooperative program.
3. Refer to the following seventeen examples of Local Policies for Cooperative Education

## Examples of Local Policies for Cooperative Education

The policies and procedures listed below can serve as an example of what may be done for a local program of cooperative education. The policies are not specific proposals but, rather, are illustrative of what might be included.

1. Selection of Students

   A. Students enrolled in the cooperative program must be at least 16 years of age.

   B. The students enrolled must have the ability to enter and progress in the vocation or occupation for which instruction is given.

   C. The final selection of the students is primarily the responsibility of the teacher-coordinator. The coordinator and members of the guidance staff should work together in developing and selecting a testing program that will provide the needed information about each student.

   D. All students enrolled must attend the pre-employment orientation class before the job interview is arranged.

   E. A student's parents should be interviewed.

2. Student Wages

   A. When the student enrolls, he should be paid as a beginning worker during the employment cooperative work-study assignment.

   B. Except for the matter of legality and the prevention of exploitation, the school should not enter into the problem of wage standards.

   C. Students employed in firms involved in interstate commerce should be paid at the established hourly rate in accordance with federal minimum wage regulations. All employed students under 18 must have "work permits."

3. Student Safety

   A. Employed students should provide their own transportation to and from their place of employment.

   B. Training stations should be selected with due consideration for the regulations regarding the employment of minors and safety factors.

   C. Employed students must be covered by workmen's compensation and disability insurance.

4. Training Plans and Agreements

   A. To provide for maximum individual training and direct on-the-job experience, a plan outlining the kinds of experiences to be assigned on the job will be prepared by the teacher-coordinator and the on-the-job supervisor.

   B. A written training agreement outlining the specific responsibilities of the parties involved should be prepared by the school when the student is placed on his training station.

5. Class Size

   A. The number enrolled in each related class should be specified. Some authorities recommend a minimum of fifteen and a maximum of twenty-five students.

   B. The maximum number of students assigned to one teacher-coordinator for placement and follow-up should not exceed the number that he is able to visit at least once or twice each grade period.

6. Related Instruction

   A. A minimum of one regular class period per day will be provided for related classroom instruction.

   B. Approximately 50 percent of the total classroom instruction in a one-year program should relate to general employment information. The memainder of the time will be devoted to individual study related to the specific job assignment and the procedures and processes involved.

7. Facilities for Related Instruction

   A. The cooperative education classroom should be equipped with tables and chairs suitable for individualized instruction. Adequate storage for reference books, pamphlets, and magazine, and other necessary materials should also be provided.

   B. Study guides related to the particular vocation should be available for individualized study.

8. On-The-Job Instruction

   A. The total time spent in school plus the time on the job should not exceed 40 hours per week.

   B. School time plus hours in employment should not exceed 8 hours per day.

   C. To receive credit for on-the-job training, the student should have a satisfactory job evauluation in terms of total hours of on-the-job instruction, experience, and other performance factors.

d. The length of the on-the-job instruction should be specified. Some authorities suggest a minimum of three months.

9. Placement in Training Stations

a. The teacher-coordinator should develop a systematic method of selecting training stations for student-trainees.

b. When the student-trainee shows a sufficient degree of maturity and responsibility, he is placed in a training station as a part-time employee. Placement in the training stations should be completed before the close of the first grading period.

c. Employers should interview and select the student-trainees to be employed.

10. Community Activities and Promotion--A continuous program of public relations should be promoted by the teacher-coordinator.

11. Follow-Up of the Student-Trainee--The teacher-coordinator should maintain a follow-up file of graduates of the cooperative program. A report on graduates should be made to the advisory committee, administrators, and supervisors.

12. Program Evaluation--The cooperative education program should be evaluated each year. This evaluation should be based on the following:

a. The number of students who have achieved their career goal through the cooperative education program.

b. A favorable reaction of employers regarding the adjustment and performance of the cooperative students in the employment situation.

c. A general reaction survey based upon the attitudes of parents, teacher, guidance personnel, administration, etc.

GUIDELINE NO. 8

Advisory Committees

Guideline

Advisory committees for cooperative education should give assistance to teacher-coordinators and teacher-educators.

Explanation

Three topics will be explained, which include (1) justification of the advisory committee, (2) two types of committees, and (3) the functions.

(1) The Vocational Education Act of 1963 makes the use of advisory committees mandatory for vocational programs at the state and national levels. If the instructional program is to be kept in tune with the needs of the individuals and the agencies to be served, they are also needed at the local level. The term consulting committee is sometimes used instead of advisory committee.

(2) In large communities at least two types of advisory committees are usually organized to help the vocational-technical program. One committee is concerned with the total program, and the other deals with one cooperative education program, and the other deals with one cooperative education program, a trade field, or a family of occupations. The first type is often referred to as the "general" advisory committee, and the second type is Designated according to the vocation or service it is organized to advise. Sometimes this committee is called a "craft" committee; for example, the "cooperative office education advisory committee." In a small community, one

committee may serve a cooperative program which has placements in off-farm agricultural businesses, service agencies, distributive establishments, business offices, and the industrial trades.

(3) An effective advisory committee should add strength to the cooperative education program by serving as a sounding board for new ideas.

Implementation

1. Composition of Advisory Committee--All major trade or occupational groups of employers and employees should be represented. Each group should suggest names from which the teacher-coordnator can make a selection.

2. Letter of Invitation--The letter of invitation, asking a prospective committee member to serve, should come from the superintendent of schools. This letter should make clear to the prospective member the function of the advisory committee.

3. Employer and Employee Representation--It is well to have the same nember of employer and employee representatives on the committee. A community representative may also be included.

4. Size of Committee--A committee of eight to twelve members is usually adequate.

5. Philosophy and Objectives of the Program--The school representative should be prepared to instruct the committee members regarding the philosophy and objectives and implementation of the vocational program.

6. Involvement of Superintendent--The superintendent or his representative should explain the consulting aspects at the first meeting of the advisory committee.

7. Representation by the school--A school representative usually serves in an ex officio capacity. Sometimes, the school coordinator will serve in this capacity as the secretary to the committee.

8. Term of Office--A plan should be developed for the rotation and replacement of committee members. Usually, a member will serve two or three years.

9. Agenda--A tentative agenda should be prepared and sent to the members several days before the meeting.

10. Minutes of the Meetings--At the conclusion of the meeting, the secretary should prepare the minutes of the meeting and mail them to each member of the committee.

11. Frequency of Meetings--Frequency of meetings should be established in the light of the work to be done. Once or twice each year should be often enough to meet after the program is well established.

12. Advance Planning--The teacher coordinator should involve the advisory committee in advance planning.

13. Committee Functions and Certain Observations and Suggestions--Additional assistance in establishing and operating the advisory committee follow:

## Committee Functions

Advisory committees can assist local school personnel by:

1. Reviewing the goals and objectives of the local vocational program.
2. Explaining the cooperative programs to their friends and fellow workers.
3. Reviewing the course content or courses to be taught to see whether they are vocationally sound and are in keeping with the occupational needs of the community.
4. Reviewing ways and means of relating in-school to on-the-job instruction.
5. Recommending instructional facilities and methods for the selection of a teacher-coordinator to the school administration.
6. Interpreting regulations relating to the employment of minors.
7. Discussing local employment opportunities and standards.
8. Reviewing the guidance, counseling, and selection procedures.
9. Making recommendations regarding the placement and training of cooperative students on the job.
10. Assisting in finding training stations for cooperative students.
11. Working with the school in developing evaluation procedures for the local vocational program.
12. Assisting in organizing a follow-up program of cooperative graduates.

## Observations and Suggestions

1. Strong cooperative programs have active advisory committees.
2. Advisory committees reflect the thinking of community in regard to educational activities.
3. School administrators and coordinators should evaluate the committee's advice, use it where it can upgrade existing programs, and initiate new ones.

4. Many criticisms leveled at cooperative programs can be avoided if active advisory committees are used effectively.

5. The planning of a committee meeting can be as valuable as the benefits derived from the meeting.

6. Committee members should be informed about activities of the local program.

7. The philosophy and objectives of the local program should be clearly defined by the coordinator and his superiors for the advisory committee.

8. Teachers and students usually react favorably when they learn that a representative group of community leaders are assisting in the local vocational program.

9. When selecting committee members, consider interest in school program, background of experience in relation to the committee's work, and community stature and leadership in the occupation or trade involved.

10. The benefits far outweigh the effort required to organize and involve the advisory committee.

11. Establish a suitable time, date, and place for future meetings.

## GUIDELINE NO. 9

### Public Relations Activities

Guideline

Effective public relations should be carefully planned to inform the public of the advantages, principles, and goals of the cooperative program.

Explanation

The cooperative program needs support from the school teaching staff, employers of the students, parents, workers in participating firms, and members of the community. This support can be obtained through an active information program designed to inform these groups about the cooperative program.

Good public relations revolve around the teacher-coordinator. He should develop good relations through his contacts with other teachers, students, employers, and community leaders. He should also utilize graduates of his cooperative program to inform the public about the usefulness of the program.

Implementation

1. Effective use of Media
   a. All communication media should be utilized in the cooperative program.
   b. News is not planned. Reporters, newscasters, feature writers, and other public information officials are antagonized by deliberate attempts to "advertise" in their media. If news occurs, call the education writer or editor in the respective media. At the same time, prepare a news release to give to him when he arrives. Let the newsman decide whether or not

to include pictires. Invite him to look through your files to select pictures which might relate to the cooperative program.

c. Involve only those parties who make the news in the news story. Do not attempt to "tell" the newsman what to write.

2. Feature Stories--During the year, the teacher-coordinator should write or have written feature stories about the cooperative program. These should be submitted as "exclusives" to selected media, such as radio, television, newspaper, business periodicals, and trade publications.

3. Reports to Faculty and Administration--Inform the faculty and administration about all news in the cooperative program. This can be done through a weekly newsletter and an end-of-the-year annual report about the program.

4. Public Relations for Parents--Parents can be the biggest boosters of the cooperative program. Prepare a printed newsletter every two weeks and mail to the parents of the student-trainees. The newsletter should include general news about the program and personal notes of interest.

5. Business Awards--Initiate "outstanding student" or "student of the year" awards through the organizations in the community which contribute to the cooperative program.

6. Alumni Group--Organize graduates from the cooperative program into an alumni group. The teacher-coordinators should attend their meetings and serve as advisors to these groups.

7. Additional Information Material--Additional material telling about the cooperative program should be prepared and presented to interested groups or individuals. this material could be in the form of printed brochures, films, slides, or radio tapes.

GUIDELINE NO. 10

Teaching Facilities

Guideline

Teaching facilities should be planned for maximum and effective use.

Explanation

Instructional facilities may consist of classrooms and fully equipped shops or laboratories where pre-employment skills are taught, including study tables, chairs, desks, files, bookcase, chalkboards, bulletin boards, and magazine racks. A coordinator's office and a combination conference room and library should also be provided adjoining the classroom.

Implementation

1. Classroom--Instructional facilities should be flexible enough to provide both group and individualized instruction. Consideration should be given to the facilities required by the largest class. The classroom should present a realistic atmosphere and allow sufficient room for the students and teacher to work efficiently.

2. Storage Space--Provision should be made for the storage of instructional aids and equipment such as charts, slide projector, overhead projector, student's notebooks, instruction sheets, reference pamphlets, and supplemental books.

3. Distributive Education--If the room is to be used for distributive education classes, the equipment should include display cases, sales counter, cash register, storage facilities, and other equipment needed for an effective instructional program.

4. Office Practice--If the room is to be used as an office practice laboratory, the equipment should include typewriters, adding machines, bookkeeping facilities, file cabinets, transcribing units, and other equipment needed to provide skill-developing activities for those who may need practice to gain proficiency.

5. Industrial Vocations--If pre-employment instruction is given in the industrial vocations, the shops should be equipped with tools and machines that would normally be found in the places of employment.

6. Off-Farm Occupations--If pre-employment instruction is to be provided in off-farm occupations, facilities should be available to teach the background skills needed for represented areas of employment.

7. Coordinator's Office--An office should be provided for the coordinator where he can conduct interviews, keep student records, and work while the classroom is in use by another group.

8. Combination Conference Room-Library--A combination conference room-library should be adjacent to the instructor's office and classroom, so that the instructor can easily get to both the conference room-library and the classroom.

GUIDELINE NO. 11

In-School Instruction

Guideline

In-school instruction should make on-the-job experience educationally valuable.

Explanation

In every cooperative education program there is evidence of at least two major plans. One plan consists of related instruction and the other plan defines the learner's duties at the training station. This guideline is concerned with the nature of the related instruction.

In-school instruction should be classified in two major phases. The first phase consists of units that relate to all types of employment with information and technical knowledge needed for the development of vocational competence.

The second phase consists of units relating to the student's job. These units can be studied on an individual or small group basis.

Implementation

1. Training Plan--The training plan, prepared by the teacher-coordinator and the student's on-the-job supervisor, should identify the job activities to be studied, the knowledge and skills needed for successful performance of those activities, and which elements of the training will be given in school and which will be given on the job. The educational aspects of the plan should be emphasized rather than production requirements. The next guideline specifically deals with on-the-job instruction.

2. Relationship Between Instruction In-School and On-The-Job--Each student should understand that the in-school and on-the-job instruction represent two aspects of the same process, and both should contribute to the achievement of his career objectives and to transition, upon graduation, from school to full-time employment.

3. In-School Instruction--In-School instruction should be based on an analysis of the requirements of the on-the-job experiences.

4. Content of In-School Instruction--The content of in-school instruction typically includes:

   a. Orientation units such as how to apply for a job, employee responsibilities, development of good work habits, the importance of proper grooming, laws and regulations affecting the worker, social security, income tax, and the elements of proper communication. This instruction should be given before the first employment interview.

   b. Units on work habits and attitudes. The student-trainee should learn elements of job responsibility from his instructor. The student-trainee should understand that the on-the-job training station is a learning laboratory to practice desirable work habits and attitudes that contribute to his own personal development.

5. Community Resources--The teacher-coordinator should bring resource personnel into the classroom to handle certain units.

GUIDELINE NO. 12

On-The-Job Instruction

Guideline

On-the-job training in the cooperative program should contribute directly to the development of occupational competency.

Explanation

Occupational competency is developed by the student-trainee at the training station. It takes the collective effort of both the on-the-job supervisor and the teacher-coordinator to implement the details of the on-the-job training plan. The on-the-job supervisor instructs the student-trainee at the training station.

Implementation

1. Duties of the On-The-Job Supervisor

   a. The on-the-job supervisor, designated by the employer, should orient the student to his training station.

   b. The on-the-job supervisor should help the teacher-coordinator determine the necessary pre-employment skills and knowledges for placement of the student-trainee.

   c. The on-the-job supervisor should telephone the teacher-coordinator about problems that arise.

   d. The on-the-job supervisor should encourage the student-trainee to ask questions to clarify instructions and avoid mistakes.

   e. The on-the-job supervisor should teach safety practices along with the specific skills involved in doing a particular job.

f. The on-the-job supervisor should prepare periodic evaluations of the student-trainee's progress.

2. Responsibilities of the Teacher-Coordinator

a. The teacher-coordinator should help the employer understand the educational philosophy, the plan, and the purpose of cooperative education.

b. When the teacher-coordinator visits the on-the-job supervisors, he should report first to the main business office.

c. The teacher-coordinator should visit each student-trainee on the job at least once each grading period. Visits should be made more often if job adjustment problems exist or if additional attention and help is necessary.

d. The teacher-coordinator, when visiting the student's employer, should be concerned about the following: (1) satisfaction of the employer with the work of the student-trainee, (2) the student's attitude toward his job, his employer, and his fellow workers, (3) the student-trainee's satisfaction regarding his own progress and learning experiences, and (4) the nature of the related instruction that should be assigned.

e. The teacher-coordinator should inform the on-the-job supervisor about the student-trainee's progress in school.

3. Student Reports--Some teacher-coordinators require student trainees to prepare a daily work record listing the operations, jobs, and processes performed at work. This record provides a report of each day's activities and a continuous summary of on-the-job experience.

## GUIDELINE NO. 13

### Evaluation of Training

Guideline

The evaluation of the cooperative education program should be a continuous process covering all aspects of the program.

Explanation

The following questions will serve as the basis for evaluating the effectiveness of the various aspects of the program. The answers to the questions listed, therefore, should reflect the quality of the program. The growth and development of the students enrolled as they study and work toward realistic vocational goals should be the primary concern in every phase of evaluation. Suggested evaluation guide follows:

### The School

| | | Yes | No |
|---|---|---|---|
| 1. | Does the cooperative education program provide for the full range of abilities of the student-trainees? | _____ | _____ |
| 2. | Are the school administrators interested and involved in defining policies relating to the cooperative education program? | _____ | _____ |
| 3. | Are the enrollment standards for the cooperative program realistic in relation to the vocational demands? | _____ | _____ |
| 4. | Do the student personnel records contain information about the background, interest, potential, and achievement of the students enrolled? | _____ | _____ |
| 5. | Is the cooperative education program geared to the needs of the community it serves? | _____ | _____ |
| 6. | Does the school have a plan for student placement and follow-up? | _____ | _____ |

## The Teacher-Coordinator

| | | yes | No |
|---|---|---|---|
| 1. | Does he have the necessary background of professional training and employment experience? | _____ | _____ |
| 2. | Does the teacher-coordinator prepare student-trainees to be productive citizens? | _____ | _____ |
| 3. | Does he enjoy working with school personnel, employers, and other community groups? | _____ | _____ |
| 4. | Is he articulate in explaining the educational and job adjustment values of the cooperative education program? | _____ | _____ |
| 5. | Does he maintain adequate student personnel records to show their progress both in school and on the job? | _____ | _____ |

## The Program

### Organizing New Programs

| | | | |
|---|---|---|---|
| 1. | Is there a plan for starting and operating a new program? | _____ | _____ |
| 2. | Has the local school administrator utilized the resources of the State Department of Education in establishing the cooperative program? | _____ | _____ |
| 3. | Does the teacher-coordinator cooperate with the school administration in presenting the program to the community? | _____ | _____ |
| 4. | Are there specific objectives for the cooperative education program? | _____ | _____ |
| 5. | Do the local school administrators have school policies for the organization and operation of the cooperative program? | _____ | _____ |

### Advisory Committee

| | | | |
|---|---|---|---|
| 1. | Does the representative advisory committee meet regularly with school personnel to assist them in the development of the program in the community? | _____ | _____ |
| 2. | Does the teacher-coordinator assist the advisory committee chairman in preparing the meeting agenda? | _____ | _____ |
| 3. | Does the teacher coordinator keep the advisory committee informed of activities and developments affecting the local program? | _____ | _____ |

| Public Relations | Yes | No |
|---|---|---|
| 1. Is a public relations program in operation? | _____ | _____ |
| 2. Does the teacher-coordinator disseminate helpful information about the cooperative program? | _____ | _____ |
| 3. Are trade associations and employer and employee groups encouraged to recognize outstanding student performance by presenting suitable awards and prizes? | _____ | _____ |
| 4. Do the school administrators and student-trainees sponsor an appreciation banquet for the cooperative employers? | _____ | _____ |
| **Teaching Facilities** | | |
| 1. Are the teaching facilities flexible enough to permit the use of the best instructional methods? | _____ | _____ |
| 2. Is there sufficient storage space for supplies? | _____ | _____ |
| 3. Are there adequate facilities for student-teacher conferences? | _____ | _____ |
| **Instruction** | | |
| 1. Is there a syllabus for the in-school instruction? | _____ | _____ |
| 2. Does the teacher-coordinator use the on-the-job experiences of students when teaching the related class? | _____ | _____ |
| 3. Is there a pre-employment orientation to prepare the student-trainee for an interview? | _____ | _____ |
| 4. Are various teaching methods used in the related class to provide for both individual and group instruction? | _____ | _____ |
| 5. Does the employer understnad the plan, purpose, and educational philosophy of the cooperative education program? | _____ | _____ |
| 6. Does the school give graduation credit to the student-trainees for successful on-the-job experience? | _____ | _____ |
| 7. Does the employer evaluate regularly the student-trainee's performance and progress? | _____ | _____ |

Evaluation

| | Yes | No |
|---|---|---|
| 1. Is opportunity given to members of the school faculty to discuss the cooperative education program as a means of educational development? | _____ | _____ |
| 2. Does the school have a follow-up program? | _____ | _____ |
| 3. Are the opinions of parents sought in evaluating the program? | _____ | _____ |
| 4. Are the opinions of employer sought in evaluating the program? | _____ | _____ |
| 5. Are the opinions of graduates sought in evaluating the program? | _____ | _____ |

## The Student-Trainee

Recruitment and Selection

| | | |
|---|---|---|
| 1. Is there a plan for publicizing the cooperative education program? | _____ | _____ |
| 2. Are the students capable of achieving success in the occupations selected? | _____ | _____ |
| 3. Does the advisory committee take an active part in the recruitment and selection of students? | _____ | _____ |
| 4. Does the guidance office supply test information for counseling applicants? | _____ | _____ |

Placement and Supervision

| | | |
|---|---|---|
| 1. Are the student-trainees placed on jobs which will provide them with the kinds of experience needed for a career objective? | _____ | _____ |
| 2. Does the teacher-coordinator regularly visit the student-trainees on the job? | _____ | _____ |
| 3. Are the elements of job safety checked by the teacher-coordinator and the employer? | _____ | _____ |

Legal Responsibilities

| | | |
|---|---|---|
| 1. Is the teacher-coordinator informed of the changes in regulations of the employment of minors? | _____ | _____ |
| 2. Are the cooperating employers familiar with the insurance needed to protect the student-trainee? | _____ | _____ |

| | Yes | No |
|---|---|---|
| 3. Is there a good working relationship between the school and the law enforcement agencies about the employment of minors? | _____ | _____ |

Activity Program

| | | |
|---|---|---|
| 1. Does the school have a youth group program for cooperative education student-trainees to develop informal learning and leadership? | _____ | _____ |
| 2. Do the students conduct an annual appreciation activity for the employer? | _____ | _____ |

The Employer

| | | |
|---|---|---|
| 1. Does the cooperating employer understnad his role in the education of the student-trainee? | _____ | _____ |
| 2. Does the employer provide a variety of learning experience for each student-trainee? | _____ | _____ |
| 3. Does the teacher-coordinator show equal concern for both the employer and student-trainee when placement is made? | _____ | _____ |
| 4. Does the on-the-job supervisor decide with the teacher-coordinator what should be taught in the related class? | _____ | _____ |
| 5. Is there a training plan in use for each student-trainee? | _____ | _____ |

## GUIDELINE NO. 14

### Legal Responsibilities

Guideline

The legal aspects of the employment of cooperative students should be known and adhered to by the teacher-coordinator and the employer.

Explanation

Cooperative education programs must be operated within federal, state, and local laws and regulations. These laws relating to the employment of minors are similar in every community. The teacher-coordinator should keep informed about the regulations applicable to his school service area, such as employment certification, hazardous occupations, wage and hour laws, jobs requiring licenses, and social security regulations.

The teacher-coordinator should discuss with the cooperating employer, the student, and the parents all regulations applicable to the job. Any questions about regulations should be discussed with a representative from the proper governmental agency.

Implementation

1. Work Permits and other Working Papers--The teacher-coordinator should work closely with the agency concerned with enforcing the child labor laws.
   a. Instructions about the "work permits," employment certificates, or working papers should be given to each student.
   b. The school records should show when "work permits" have been issued to students. Such permits must be issued before they are placed on a cooperative job.

c. The employer should be reminded that a student under 18 cannot be legally employed without a "work permit."

2. Child-Labor Laws--The teacher-coordinator should study the child-labor laws in his state.

3. Fair Labor Standards Act

   a. State staff members, concerned with cooperative education programs, should inform the state administrators of the Fair Labor Standards Act and other similar regulations about the purposes and plan of operation of cooperative education.

   b. The teacher-coordinator should be informed about the provisions and amendaments of the Fair Labor Standards Act of 1938 regarding interstate commerce.

      (1) He should discuss with the employer provisions relating to minimum wage and overtime pay.

      (2) The employer should know how exemptions may be made by issuing special certificates for learners and apprentices.

4. Disability Insurance--The teacher-coordinator should discuss with students the terms of disability insurance carried by business and industry.

5. Workmen's Compensation Insurance--The teacher-coordinator should exercise caution in placing students with employers who may not carry workmen's compensation insurance or other comparable coverage for injuries incurred while on the job.

6. Social Security--Instruction regarding the basic provisions of the Social Security Act should be given in the related class.

*HEALTH OCCUPATIONS EDUCATION; *MEDICAL LABORATORY ASSISTANTS; *PROGRAM GUIDES; CURRICULUM; ASSOCIATE DEGREES; TEACHER QUALIFICATIONS; ADMINISTRATOR QUALIFICATIONS; CLINICAL EXPERIENCE; PROFESSIONAL ASSOCIATIONS

The program, under the direction of a qualified medical technologist responsible for coordinating its elements, may be established in a junior college or vocational school and should have formal agreements with clinical agencies acceptable to the Section. An advisory committee should include representatives of participating hospitals, the county medical association, the hospital association, and the appropriate medical professional group. Students should have completed the requirements for high school graduation or passed the junior college's entrance examination. Health and counseling services should be available. The 1-year technical program, including the equivalent of 6 months full-time clinical practice, should cover general technical background, professional adjustments, medical ethics, medical terminology, laboratory records, basic anatomy and physiology, identification and care of laboratory equipment, aseptic technique and methods of sterilization, basic laboratory mathematics, basic laboratory solutions and media, basic elements of quality control, histologic and cytologic specimens, blood collecting techniques, patheogenic bacteriology and parasitology, serology and blook banking, clinical chemistry, urinalysis, and hematology. Basal metabolism and electrocardiogram are optional subjects. The Associate Degree program will also include elements in general education and basic science. The guidelines discuss (1) school bulletin information, (2) student evaluation, (3) library, classroom, and office facilities, (4) the qualifications of faculty members, (5) the role of medical director, and (6) teacher-student ratio in the clinical area. # ESSENTIALS FOR ESTABLISHING AND EVALUATING CLINICAL LABORATORY TECHNICIAN PROGRAMS

DIVISION OF VOCATIONAL, TECHNICAL, AND ADULT EDUCATION

CARL W. PROEHL, Assistant Superintendent

TECHNICAL and HEALTH OCCUPATIONS EDUCATION SECTION

THOMAS W. STRICKLAND, DIRECTOR

# INTRODUCTION

The Florida State Department of Education presents this guideline for training certified laboratory assistants as one part of its continuing effort to provide guidance in the development of effective educational programs in the health occupations. Requirements for the technical portions of any program for supportive level medical laboratory personnel are equivalent to the standards established by the American Society of Clinical Pathologists and the American Society of Medical Technologists which are recognized by the Council on Medical Education of the American Medical Association.

Approval by the appropriate medical professional group provides the graduates with the option for admission to examination for certification and licensure coincident with full access into the practice of laboratory medicine on the technical level. The flexibility inherent in the specialty standards allows the local community, in cooperation with the Technical and Health Occupations Education Section, to design a total program which best meets the particular need of that area. In addition, opportunities for graduates to obtain additional study in accredited colleges and universities are enhanced by recognizing medical training standards recommended by the professional group and required by the Florida State Department of Education.

At its regular meeting on November 2, 1967, the Advisory Committee to the State Department of Education considered in detail programs for training students in approved programs. It also considered the relationship of programs of this type to the education of laboratory

technical personnel in junior colleges. The following recommendations were presented by the committee.

1. The certified laboratory assistants program approved by the American Society of Clinical Pathologists and American Society of Medical Technologists has been an excellent program and has been a great help in developing properly qualified laboratory assistants wherever the program has been properly developed.

2. The programs for training medical technologists to be certified by the ASCP and designated as M.T. (ASCP) is an outstanding program developed for the purpose of training supervisory personnel for medical laboratories. This program is not within the limits of activity of this advisory committee.

3. Graduates of medical laboratory assistant programs in junior colleges or vocational schools should be eligible to take the examination as offered by the Board of Certified Laboratory Assistants unless and until some other program of examiniation and certification is established by the appropriate groups.

4. Program development should be within the framework approved by the American Medical Association Council on Medical Education and Hospitals.

5. Development of all programs must be kept on an "open-end"

basis in order to see that programs are properly responsive to the requirements of changing times.

## Organization and Administration

1. CLA educational programs may be established in junior colleges and vocational schools, provided faculty and hospitals suitable for directed experience are available. Participating hospitals and laboratories must be accredited or be otherwise acceptable to the FSDE, THOE section. Formal agreement should be executed with the clinical affiliations.
2. The primary responsibility for administration and planning is assumed by the school personnel. These responsibilities include organization and administration, periodic review, continued development and general effectiveness of the educational program. An advisory committee composed of representatives of the participating hospitals, county medical association, hospital association, appropriate medical professional group, and other appropriate institutions is essential to total planning. It is recommended that this committee be appointed by the county superintendent or junior college president for one or two year terms. The organization and operation of the program, including curriculum, shall be consistent with the requirements of the State Plan for Vocational Education and the policies of the State Board for Vocational Education, based on standards recommended by the Technical and Health Occupations Education Section, Division of Vocational, Technical, and Adult Education, Department of Education, State of Florida.

3. School Bulletin information should be reviewed annually and kept up to date. It should include information regarding the organization of the program and a listing of required courses, entrance requirements, tuition and fees, and general information concerning hospitals and facilities used for directed clinical experience.

4. Selection of students should be made by the admissions personnel in cooperation with those directly responsible for the educational program in accordance with the practice generally followed in the school for technical programs requiring applicants to be high school graduates. All applicants should be required to submit adequate evidence of satisfactory physical and psychological health commensurate with adequate performance in the program. Admissions data should be on file at all times in the college or vocational center.

5. A record of class performance and accomplishment of each student should be kept in accordance with the college or vocational center requirements. Because the final "grade" will be based on a combination of evaluations, it is strongly recommended that the program director and instructional staff determine weighting and construct evaluative instruments which will reflect the best methods available to teachers for fair evaluation of students. A detailed analysis of the performance in the teaching laboratory and clinical practice experience of each student should be on file.

6. Copies of the course outlines including behavioral objectives, sample instruments for evaluation, directed practice schedules and teaching plans for all phases of the technical classroom and clinical learning experience should be on file and available to instructors in both the departmental office and affiliated clinical facilities. Description for academic courses included in the total program as "supportive to the technical program" should be included.

7. It is the responsibility of the school administration to provide an approvable program in order to guarantee the graduates the option for admission to certification examination and licensure.

## Services and Facilities

8. Student health services should be available.

9. Counseling service should be available for student guidance.

10. Library facilities should be readily accessible and should contain an adequate supply of books, periodicals, and other reference materials related to the educational program. Each reference book should be available in a ratio of one copy to every 3 or 4 students.

11. Classroom space, storage, equipment and supplies appropriate to the objectives of the program and in sufficient quantities for demonstration and full student participation should be provided by the college or vocational center. Appropriate teaching aids should be available and readily accessible to the teaching laboratory and classrooms.

12. Office space for the program director or teaching supervisor should be provided by the college or vocational center.

13. The clinical practice may be provided in several affiliated clinical facilities. These affiliations should be in institutions which have sufficient qualified, experienced professional personnel, adequate equipment and practice material to provide the type and amount of experience for which the student is assigned. Each facility should be under the direction of a qualified medical technologist whose qualifications are acceptable to the Technical and Health Occupations Education Section staff as outlined by the appropriate medical professional group and required by the Florida State Department of Education. The qualified medical technologist appointed as director of the program by the school will coordinate all teaching functions in the school and affiliated facilities. All programs are entirely separate and distinct from concurrent training of other laboratory personnel.

## Faculty

14. The instructional staff should be qualified through academic preparation and experience to teach the subject(s) assigned.

15. The program director or teaching supervisor should have at least a baccalaureate degree, registration with the American Society of Clinical Pathologists, three years experience in the practice of laboratory medicine and be licensed as a medical technologist, medical technologist supervisor, or medical laboratory director in the State of Florida in order to meet medical specialty requirements. In addition, minimum standards governing persons who serve in an instructional capacity in the State of Florida must be met. The exact requirements are determined by the Division of Teacher Certification. In most

instances this requirement will necessitate completing a proscribed program in education courses. The required education courses will be defined in relation to the program setting: junior college or vocational school. All instructional staff in the school employed to teach in the technical portion of the program for certified laboratory assistants must meet these standards with the exception of the experience requirement - 2 years are acceptable.

16. A pathologist who is a Diplomate of the American Board of Pathology or has equivalent qualification acceptable to the medical professional group and the Florida State Department of Education shall be appointed as the medical director and shall serve as consultant in designing the curriculum and shall assure the adequacy of the directed clinical learning phase of the program.

17. In each directed practice area, there shall be qualified personnel with adequate experience in the specialized areas of the practice of laboratory medicine to which the students are assigned under the general direction of the director or the teaching supervisor of the program. The placement of students in clinical areas shall not exceed a ratio of two students to each member of the teaching staff. The student-instructional staff ratio during the formal, teaching laboratory classes should be in the same proportion as similar educational programs sponsored by the educational institution.

## Educational Program

18. Admission requirements: candidates for admission should have completed the requirements for high school graduation or should have passed a college entrance examination for admission to a junior college.

19. Technical program content: The curriculum shall be designed to assure students a strong foundation for the practice of the skills unique to the supportive role in the medical laboratory, working relationships as a member of the medical care team, and of the ethical and legal principles governing the practice of laboratory medicine.

The director or teaching supervisor shall assume responsibility for cooperating with other school faculty and clinical instructors to design the program for the preparation for certified laboratory assistants. Incorporated in the program should be planned laboratory experiences and directed practice with academic preparation selected to complement the laboratory practice.

The technical portion of the program shall include not less than the equivalent of six months full-time clinical practice integrated with requisite classes to establish a full-time educational program one calendar year in length. A program in a junior college leading to an Associate Degree will also include elements in general education and basic science as defined by the college.

The technical program shall include the following areas:

a. General technical background
   Professional adjustments, relations and organizations
   Medical ethics and conduct
   Medical Terminology

Laboratory Records
Basic anatomy and Physiology
Handling identification and care of laboratory equipment
Aseptic technique and methods of sterilization
Basic laboratory mathematics
Preparation of basic laboratory solutions and media
Basic elements of quality control
Handling of histologic and cytologic specimens
Instruction in blood collecting techniques
Introduction in basic hematology, serology, blood banking, urinalysis, BMR and Electrocardiography

b. Pathogenic bacteriology, parasitology

c. Serology and blood banking

d. Clinical chemistry

e. Urinalysis

f. Hematology

g. BMR-EKG (optional)

The sequence and exact allocation of time for each subject area is at the discretion of the director. Suggestions may be found in Medical Laboratory Assistant - A Suggested Guide for a Training Program, Office of Education, OE-87017.

Admission to Approved List

20. Application for admission to the approved list of training programs for certified laboratory assistants should be made to the Board of Certified Assistants, 445 North Lake Shore Drive, Chicago, Illinois 60611.

21. Approval may be withdrawn whenever a school does not maintain an educational program in accordance with the standards of the Florida State Department of Education and the medical specialty board.

22. Approved schools should notify the medical specialty board through the Technical and Health Occupations Education Section

136

whenever personnel or major curriculum changes occur in relation to the administration of the program.

## VII General Information

23. General information on the certified laboratory assistant is contained in the Health Careers Guidebook available through the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C., 20402. This publication is recommended by the Florida State Department of Education.

24. Suggestions for program design, hourly arrangements, and other materials may be obtained from the Technical and Health Occupations Section.

25. Information on careers in the field of laboratory medicine may be addressed to the National Committee for Careers in Medical Technology, 1501 New Hampshire Avenue, N.W., Washington, D.C. 20036.

26. Unless stated otherwise, the Florida State Department of Education requirements in the specialty area for approved programs are reflected in materials available from the Board of Certified Laboratory Assistants, 445 North Lake Shore Drive, Chicago, Illinois 60611.

*ASSOCIATE DEGREE WORKSHOP

Fifty-five community college administrators, nurse education personnel, and nurse association officials representing 15 states, attended a workshop designed to acquaint participants with the purposes of an associate degree program in nursing, its place in the educational community, the role of the community college, the courses which should be included, faculty requirements, and criteria for student selection. Major speeches were: (1) "The Community College: Its Purposes, Philosophy, and Programs" by K. Bunnell, (2) "The View of the Hospital Administrator" by M. Ause, (3) "The Role of Nursing Service" a telelecture by C. Weidner, and (4) "The Role of the State Board of Nursing" by M. Dickinson. Presentations by M. Montag were: (1) "The Associate Degree Program," (2) "The College and the Clinical Area," (3) "Nursing Curriculum and Facilities," "Kaleidoscopic View," and "Summary." Discussions following the presentations, a resume of the conference, summaries of small group discussions, a workshop evaluation opinionnaire and a summary of responses to it, and a bibliography are included. # FINAL REPORT ASSOCIATE DEGREE WORKSHOP

July 25 - July 29, 1966

Sponsored by
University of Colorado School of Nursing
and partially supported
by funds from
W. K. Kellogg Foundation

## Purpose

The main purpose of the one-week workshop on the Associate Degree Program in Nursing was to acquaint the participants with the purposes of an associate degree program in nursing, where this program fits in the educational community, the role of the community college in an associate degree program in nursing, the college and nursing courses which should be included in the curriculum, the faculty requirements and qualifications, and the criteria for selection of students.

## Description of Participants

The 55 participants in the workshop were 8 Presidents, Vice Presidents and Deans of Community Colleges who plan to start or have already started Associate Degree Programs in Nursing; 5 were Directors of Vocational Technical Divisions of Community Colleges; 10 were Chairmen or Instructors of Nursing in Community Colleges; 17 were Directors and Assistant Directors of Diploma Schools of Nursing; 2 were Nursing Coordinators; 2 were Instructors in Baccalaureate Programs; 5 were Instructors in Diploma Schools of Nursing; and 5 were Officials of State Boards of Nursing or State Nurses' Associations. We had expected 60 participants but five were unable to get transportation to Boulder because of the airlines strike.

The states represented at the workshop were Colorado, Kansas, Oklahoma, Wyoming, Oregon, Arizona, North Carolina, Montana, Missouri, Texas, Nevada, Iowa, New Mexico, Idaho and Arkansas.

## HOUSING

The participants were housed at a new women's residence just off campus. This residence is privately-owned but University approved housing. It has double rooms with private baths, a swimming pool, a cafeteria, laundry facilities and telephones on every floor and plenty of parking space.

All out-of-town participants lived and ate at the College Inn. Many brought their families with them. At registration on Sunday a social hour from 4 p.m. to 6 p.m. helped the participants become acquainted. On Thursday evening all the participants, their families, and the staff enjoyed a Luau around the pool.

Except for Tuesday evening, the evenings were left free so the participants would have time to go to the independent study lab, talk with one another, read, investigate and further their knowledge and learning on an independent or group basis.

RESUME OF CONFERENCE

To accomplish the overall purpose, Miss Kathryn Smith, Dean of the University of Colorado School of Nursing, opened the workshop on Monday morning with words of greeting, and the University of Colorado School of Nursing's philosophy about Associate Degree Programs in Nursing and the faculty's feeling of responsibility in assisting community colleges of Colorado and surrounding states initiate plans for Associate Degree Programs in Nursing.

Kevin Bunnell, Associate Director, Western Interstate Commission for Higher Education, and Director of the Medical Education programs presented the keynote address--"The Community College - Its Purposes, Philosophy and Programs." Mr. Bunnell said the Community College has three purposes, (1) higher education, (2) technical education, and (3) retraining of adults.

He felt that the strength of a community college can be measured by the divergence of its programs. He challenged the Junior Colleges to broaden their curriculums to meet the needs of society and the special needs of their own community.

Mr. Bunnell emphasized that the future of the Community College is assured and will grow rapidly. By 1970 he predicted that the enrollment in Junior or Community Colleges will be 1-3/4 million. "President Johnson has made the statement that we must train 10,000 new health workers each month." Kevin Bunnell feels that Community Colleges must do much of this training. (See Conference Topics).

Mildred Montag gave a history and overview of the Associate Degree Program in Nursing. The film, "An Idea with a Future" was shown with a discussion period following the film. (See Conference Topics for full context).

On Tuesday Miss Montag talked about the courses which the College offers with small group discussions following her lecture. The nursing curriculum and the facilities a community college must have for a nursing program were discussed by Miss Montag on Tuesday afternoon.

On Tuesday evening a Telelecture, "Trends in Nursing" was heard by the group. Miss Dorothy Tipple, Albany, New York, and President of the American School Health Association was the speaker. The telelecture was an unexpected "extra."

Mr. Marshall Ause, Hospital Administrator of Orange County General Hospital, Orange, California, presented the role of a hospital administrator and the hospital that is used as a clinical facility for an Associate Degree Program in Nursing.

Miss Carole Weidner was called back to her job at Kaiser Foundation Hospital before Wednesday, July 27, when she was to present her paper on "The Role of Nursing Service in the Associate Degree Programs." Her Director of Nursing Service requested her immediate return because of the mass resignation of 65 of their nurses in a demand for higher salary and other fringe benefits.

We solved the presentation of Miss Weidner's paper by setting up a telelecture connection between Miss Carole Weidner's office at Kaiser Foundation Hospital and the meeting room at the College Inn. Mr. Neal A'Hern, Communications Manager for Bell Telephone Company of the State of Colorado assisted the

Director of Continuation Education in getting "all the wheels greased" in such short notice. The lecture was clearly heard and we were able to exchange ideas, carry on a two-way discussion, and question and answer period with Miss Weidner. It was a very satisfactory substitute. We were able to tape Miss Weidner's lecture and it is in the Appendix.

Miss Montag combined the faculty and student presentation on Thursday A.M. in order to reserve Thursday afternoon to answer questions and discuss other items raised by the participants in the small group sessions.

The questions raised on Thursday Afternoon, July 28, 1966

(1) Availability of nursing faculty.
(2) Preparation of faculty.
(3) Number of faculty.
(4) Students ratio to faculty.

(a) clinical area
(b) class

The ratios depend on many factors--minimum is four: Chairman of the Department, MCN, Fundamental, Physical illness and mental illness.

(5) We must get over the notion that smallness is quality and quantity is not. In the studies that have been done there is no justification for small classes. Students learn just as well in large.

(6) Teaching Load

The usual formula of credit hours doesn't apply very well. A lock at student contact hours or clock hours spent is a better way of looking at teacher load.

(7) Expectation of Faculty Members

Same rank, salary comparable, tenure promotion, ..... retirement, have responsibility on committees and on-going activities of college.

(8) Expectation of College

Accept responsibilities of college, be scholarly and keep up to date. No exceptions made on a permanent basis.

Students:

(9) Recruitment

Support Martha Roger's position "honest recruitment" for specific programs.
Considerable and on-going interpretation of the nursing programs.
School nurses are good source to interpret nursing.
Guidance counsellors should be informed.

(10) Selection.

Should rule out those who cannot carry college work.
One way - admit student to college and if they succeed in one semester then they may enter the nursing program.
Described "Operation Second Chance" at Bronx College in New York.
Tests and grade school rank then keep records and see how they achieve. There is no evidence that interviews are of any particular value. Use college admission staff and their policies.

(11) Standards once students are in the college.

a. Same requirements and privileges should apply to nursing students as all other students.
b. Policies of college should apply to nursing students.
c. Nursing faculty must have the courage to flunk a student if student does not meet the objectives of the course.
d. Same graduation requirements and privileges.

(12) College Opportunities and Activities.

a. Should participate widely and actively in student affairs and activities.
b. Educate as a person, citizen, worker.

(13) Internship.

One-year Pasadena College were paid between R.N. salary and R.N.
Four hours C.E. orientation to institution.
Continued until law of California was amended.
All studies that have been done, students and staff said after six weeks they were doing work of the bedside nurse. More difference between individuals than there is between programs.
Nancy Hartley - St. Petersburg Jr. College
Belleville, Illinois - Belleville Jr. College
There is no evidence to support an internship.

(14) Public Relations.

Almost continuous dialogue between personnel of hospital and the college.
Everyone must understand, from Nurses Aide - Hospital Administrator.
Community must also have interpretation.
Preparation of hospital to utilize the graduate.

| | |
|---|---|
| One-day session | (college people |
| Use of Associate | (hospitals |
| Degree Graduate | (nurses |
| Graduate needs some help too | (physicians |
| | (community leaders |
| | (press - radio - T.V. |
| | (Telephone Co. |

(15) Phasing out a 3-year program and initiating a 2-year program.

It is not a question of transferring 3-year to the 2-year, but 3-year must close and 2-year begin. Two-year group will be in alumni association of the college. Inform students as soon as decision has been made. Keep them informed.

Notify:

1. State Board of Nursing Examiner.
2. Alumni Association.
3. Students in 3-year program.
4. High Schools.
5. Director of 3-year program should not attempt to direct 2-year program simultaneously.

(16) How far should you go for facilities?

Not more than fifty minutes away.
There is no merit in having a large number of agencies. A contract may need to be reviewed but not necessarily renegotiated.

(17) Health Services.

General practice - Physical on admission by family physician with x-rays, ..... , and other tests required by the college. Will depend on policies of institution.
Statement of philosophy of nursing program should be in college catalogue as the procedure of the college dictates.

Fundamentals

Nursing Science has article of Martha Rogers which outlines space and time for a 6-hour course in Fundamentals for 100 students.

3 - 3 or 4 - 2

100 ÷ 4 = 25

4 lab sections - 12 beds - all movable

| Independent | Class | College Laboratory | Patient |
|---|---|---|---|
| | | | |

What can the student do alone?
What does the student do in class time?
What can be done in a college lab.?
When do you need a patient?
"There is no one road to Rome."
Most we can and the best we can with least expenses.

(18) Learning experiences in Fundamentals.

| | |
|---|---|
| Hygienic Care | Bathing - care of skin |
| Vital signs | Care of Mouth and Teeth |
| Rest Measures | Food |
| Comfort | Feeding patient |
| Positioning with body mechanics | |

Greatest need in both Nursing Service and Nursing Education is vision and imagination.

Thursday P.M. -- July 28, 1966

Discussion of newer teaching techniques by Miss Montag

1. Television--
   Multiplication of number of places where it can be viewed--
   Used extensively at St. Petersburg in Florida--
   Described T.V. experiment at Bronx Community College--
   The article "Focus on T.V." was distributed to each participant in the workshop.

2. Programmed Instruction
   There are:

| | |
|---|---|
| T.C. | (asepsis<br>($O_2$ administration<br>(aids to diagnosis |
| Marie Seedor | (Hypodermic injection |

   Improves utilization of faculty member but a very complicated and time consuming procedure to produce the programs. Let student do programmed instruction on their own.

3. Multiple Assignment

   One patient - 4 to 6 students

Small Groups.

The workshop participants were divided into five groups of eleven with a group leader. These small groups meet approximately twice a day to discuss the theory sessions, share experiences and assist one another in their learning.

The Summary of the Group Leaders' Reports of Group Activities follows:

# SUMMARY OF SMALL GROUP DISCUSSIONS BY THE FOUR GROUP LEADERS

The small groups were productive. Many questions and problems were raised. Two Junior college people raised specific questions about starting their own programs. All members of the group participated. We believe the groups were worth-while. Diploma people were somewhat defensive but did not oppose AD program. The major problems discussed were:

1. Preparation of teachers for teaching in an A.D. program.
2. Inclusion of an A.D. program in a four-year program--the college requiring more credits than feasible in the A.D. program for graduation.
3. Changing present faculty members' concepts to the philosophy of A.D. programs.
4. Development of sufficient number of community colleges to initiate A.D. nursing programs as well as the location of these colleges near or in vicinity of satisfactory clinical facilities.
5. Considerable discussion on motivation recruitment and selection of students.
6. Nursing program has a need but is not unique in the responsibility to explore new teaching techniques and use of new teaching methods in achieving objectives in the laboratory or classroom.
7. What are the resources of the college?
8. What is available in terms of equipment in the college and the expertise needed to use this equipment?
9. Further exploration of the use of multiple assignments, programmed instruction and other techniques by carefully planned workshops and conferences. Need for teaching faculty to have opportunity to attend and such a workshop available.

The questions of the group were answered in the afternoon session on Thursday. These mainly were concerned with:

1. The A.D. graduate accepting "beginning" leadership responsibilities such as team leader.
2. "Supervised internship" period for A.D. graduate.
3. To what extent the school should communicate with employers as to utilization of A.D. graduates? Liaison committee between school and nursing service.
4. Reasonable instructor load in terms of clock hours (total) and student ratio.

The only recommendation was in relation to planning the workshop for next year. It was suggested that a workshop be conducted next year (summer of 1967) specifically for teachers and dealing with development of course outlines and identification of specific learning experiences. It was also recommended that a follow-up workshop be held during the summer of 1968. The questions raised in relation to this were the possibility of an annual teachers' workshop and the possibility of a traineeship for this purpose.

Out-of-state members asked that earlier publicity about the workshop be sent out.

## Independent Study Laboratory

A large room on the third floor of the College Inn was furnished with various types of audio visuals and programmed instruction material. The lab was open at all times. The participants could use the materials, check out library books, listen to tapes, preview films or browse.

The lab contained an 8mm cartridge projector with about 20 cartridges which could be placed in the projector for viewing, A Fairchild, an opaque projector with transparencies, two tape recorders, and 12 educational tapes which the participants were welcome to play. A movie projector and screen with 12 films which could be previewed, film catalogues, tape catalogues and programmed instruction catalogues were available.

A large assortment of books pertaining to teaching and to the associate-degree program were also available in the independent study laboratory.

The laboratory was a popular area early in the mornings, during lunch hour and after the dinner hour.

### Evaluation -

Miss Montag was well received by the group and presented the information which these people seemed to need. Large and small group discussions were very active and sometimes a bit heated. The overall atmosphere was one of free exchange, interchange and seeking of knowledge and information.

A summary of the participants' evaluations and the Kropp-Verner Scale is in the Appendix of this report.

### Future Plans -

We plan to offer another workshop on the Boulder campus - July 24-28, 1967. The emphasis of this workshop will be geared to the instructors in Associate Degree programs. Teaching methods, curriculum, clinical experience and program will be discussed. We have asked Miss Mildred Montag to return. If Miss Montag is available we will also plan a week-end Institute for Presidents and Deans of Community Colleges to precede or follow the workshop for Associate Degree Instructors.

CONFERENCE TOPICS

WELCOME

Kathryn Smith, Dean School of Nursing

I have been asked to welcome you to the University of Colorado and to the School of Nursing specifically. When I first came to the University of Colorado last July, I was encouraged to make our School of Nursing summer program bigger than ever. Some of us sat down and we decided we would have a fiesta; since the 25th of June, we have had a fiesta. We've had a lot of fun and we've had a lot of people involved in learning. It has been a most exciting summer. We've had undergraduate and graduate students; workshops such as this one going on simultaneously and I might say, we've worn out, almost worn out, our summer faculty by involving them in a number of things simultaneously with the different kinds of students.

This conference is an effort on our part to make a difference or to influence the development of associate degree programs. We are interested in accelerating their development in Colorado and in the surrounding areas. I think we have brought into this conference not only people from Colorado but areas not too far away from this state.

When we planned this conference, we were aware that the Position Paper was in the making. Those of you who do not know about the Position Paper, I'm sure you will before the end of this conference. At any rate, we knew the Committee on Nursing Education of the American Nurses Association was working toward releasing a position on levels of nursing education. That paper was released in December. At the time we were planning, we anticipated its release and we thought we would try to capture the leader in the development of the associate degree in nursing program movement. We were able to get Miss Mildred Montag. I am sure she was in great demand because this is a very critical time in the development of these programs since the release of the Position Paper.

I know you will have a very stimulating conference. We hope to follow this conference with a series of conferences as yet unplanned. I'm sure as an outcome of this conference, we will have better guidelines for what we should do to promote the development of these programs in the future. It is our hope that we will not only have workshops that will progressively meet the needs of people interested in these programs, but to help prepare teachers in associate degree programs or who are already prepared to teach in other kinds of programs and who will probably need short-term courses to help them be effective in associate degree programs. This is one of the aspects I anticipate.

In addition, our school hopes to get funds to support a full-blown graduate program that would prepare teachers for associate degree programs in nursing.

Have a very nice week. You are in a very nice setting, you have a very good staff and I envy you very much. I would love to be with you for all of your sessions. Good luck and thank you.

The Community College - Its Purposes, Philosophy and Programs

July 25, 1966

KEVIN BUNNELL--Before I start I want to introduce Jim Allen who is a student researcher on our staff who has been working with me on the preparation of this paper. Jim has lots of information in addition to what I am going to present.

I want to talk with you for awhile about a specific case in the development of a junior college and then turn to the material that appears on my outline. One thing we might do is focus our discussion around issues in the development of community colleges and in the operation of them.

First, the Boulder County case. This case has no significance in itself except as you can generalize from it. My purpose in presenting it is to give you some idea of the forces at work in the development and operation of a junior college.

Last June 7 the voters of Boulder County came together as is provided by state law to express themselves on the question of whether a junior college district should be established within the boundaries of Boulder County. This procedure is prescribed by state law. We have here in Colorado essentially a system of local initiatives for establishing junior colleges. In order to do this, a committee of laymen must first of all do a feasibility study to demonstrate that such a college--that it is appropriate to establish such a college. This study must be approved by the state board of education. Then this lay committee must conduct an enlightenment campaign to inform the voters of the need and secure the approval of the qualified voters, and in this case, it is those who pay property taxes in the county.

Let's go back and ask this question: What were we proposing in Boulder County in the way of a community college? The reason I am up on this is because I acted as coordinator of the effort on a countywide basis working with the chairmen in the various towns in the county.

First of all, we were proposing this kind of a curriculum--we wanted to offer a course, programs that would be transferable to the last two years of university work. What we call college transfer studies--college parallel studies.

We were also proposing to offer terminal liberal arts courses for those people who simply want two years of general education at the college level who are not yet prepared to commit themselves to a specific vocation, but who do not particularly want to prepare themselves to go on to the last two years of college.

Third, we were proposing technical and occupational courses, and here I would not consider these courses terminal. We were interested in offering courses which were of special need to this community, which as you perhaps know, has a large number of what we call light industry and research industry. We were also interested in offering adult education. Retraining for those who already have some special kind of vocational training and training from the ground up for those adults who feel they want to upgrade themselves from unskilled to skilled categories.

We would want to build into the curriculum a very extensive guidance program.

We were proposing a community college--an open-door college--what have we got here that will benefit you.

We were thinking of a very functional campus with very little fallderall and extra frills. Classrooms, laboratories, a minimum if any research facilities, no dormitories because this was going to be a commuting college. This would be an institution primarily, if not exclusively, devoted to teaching. You may ask--what about athletics? My own feeling was, let's have a good intramural athletic program but let's not get involved in intercollegiate athletics.

Considering the organization and administration of the proposed college, this was going to have a local board elected by the people. Five members from the county.

The college would be a grass roots institution accurately reflecting the needs of the community. Serving unique functions as a two-year college.

Discussed changing times and future.

In effect, we are changing the rules on these young people. We used to say you must have a high school diploma. Now we say, you must have at least two years of college.

On June 7 the people of Boulder County rejected the idea of this junior college. In my judgment it was the tax issue. Another reason may have been because the people still weren't convinced the University couldn't do the job. Many people did not grasp the unique function of the community college.

Discussed historical development of junior colleges

We are talking about taking a broad spectrum of student talent, we are also talking about offering them a broad spectrum of courses. The community college must be a multi-purpose institution if it is to serve its purpose.

In line with the multi-purpose concept of the community college, it is generally agreed that its unique contribution comes from its emphasize in three different areas; first, the preparation of students to university level, second, preparation of students for immediate employment in technical and semi-professional levels and third, the retraining of adults.

One can measure the strength of its community college by the diversity of its programs.

About 60% of the community colleges are public.

The three principal types of two-year institutions that have developed--public. The locally controlled and supported with or without state aid. The junior college fully supported by the state. The two-year extension of a four-year college or university.

More than a third of the public two-year institutions are found in four states. Most of the private are found in the east and the south.

State control can encourage effective statewide planning for junior colleges.

The most important argument against state control is, it makes it difficult for a junior college to adapt to local requirements.

To say the least, the future of the community college is assured. Between 1965 and 1970 we are going to go from just over a million in community colleges to just under two million.

Full time faculty in community colleges will go to 49,000.

During the 1960's the number of women working will rise at nearly twice the rate for men. Tremendous demands are being placed on this labor force by the health services. Medicare will need many of these people. The number of 700 ADN's graduated in 1961 to 5,000 in 1970. To meet these national needs, President Johnson says we must train 10,000 more monthly--health workers--until 1970.

The Allied Health Professions Act is one of the most important pieces of legislation to affect the junior colleges. It provides $26 million over three years. $500. per student paid to the institution for all students enrolled in certain qualified health programs. An additional grant per curriculum of $5,000. ---there was a fight in the house about including associate degree nursing programs but I understand it is now passed. There will also be funds for construction and improvement funds. For faculty to improve themselves.

Discussion Period - July 25, 1966

Question--What is required to be admitted to a nursing program? Specifically, suppose a girl is rated on an eighth grade level, has a very poor high school grade, is in the 10th percentile in the SAT - would she be admitted to this program or doesn't the open-door college apply in this instance?

Answer--In my judgment, the open-door policy would not apply except in this way. I said guidance counseling was an extremely important part of the whole program. If you have a good guidance program you are not counseling a girl with an 85 IQ and eighth grade reading ability into a nursing program. You are saying, the "buck" stops here. If there is something here you can benefit from, we're going to try to get you into it, but this doesn't necessarily mean that she gets into what she says she wants if this is an unreal aspiration.

Question--What is your feeling about a practical nurse program and an A.D. program in the same college?

Answer--I can answer that quickly by saying, I don't think I am qualified to answer. I think we should call on somebody else.

M. Montag

Answer--There are two answers to that - 1) The Position Paper takes a particular stand with respect to practical nurse programs, so if we are to implement the Position Paper, I would see the gradual demise of practical nurse programs. 2) I would answer the question in exactly the same fashion I answered the question at the telelecture with respect to baccalaureate programs and associate degree in the same institutions, it is possible but not desirable because it is almost impossible for there to be a clear and distinct separation and distinctly different objective developed. It certainly would require an entirely separate faculty. To move from one program to another, as I understand some programs are doing, is, I think, virtually impossible. I would not recommend both programs in the same institution.

Question--I was wondering in terms of financial support, if any state has devised a plan of matching funds between state and community such as federal does in federal and state.

Answer--In the State of Colorado, if a community agrees to establish a junior college district, then it becomes eligible to receive from the state treasury and the funds are generated primarily by the income tax which is a very broadly based tax. They become eligible to receive for each full-time equivalent student--$500. for each equivalent student. The cost of operating a junior college in Colorado varies rather widely--the average is $800. Take that as a typical figure. Of the $800., $500. is paid by the state, $150. would likely be paid by the student and the other $150. would be paid out of the county tax _____ by a mill levy. So it is a relatively small proportion of the total cost. You also have the problem of capital funds. The picture is changing in Colorado. At the present time under the Higher Education Facilities Act, a college can receive up to about 40% of the cost of buildings from the federal government. This is a program that is administered through the state.

In the last session of the legislature, funds were appropriated to community colleges for capital purposes for the first time, so there may be state funds

coming in here too. The balance has to be made up out of the local community. In a state like New York it is divided three ways--equally for operating costs, student, state and local communities. A third each and 50-50 for capital costs. The patterns vary widely among the states. Jim Allen has a paper with some of these patterns on it--Jim do you want to add anything to what I said?

Jim Allen--Illinois is a good example. There is a state providing 45%, local community 45% and student only 10%. Capital outlay is supported 100% by the local community.

Question--May we go back to some of the first questions? -- I work in a junior college where there is an open-door policy but it is not for data process, nursing education, dental assistants or for pilot training. It is open-door in the fact that they are advised to take general courses and if they qualify, we will consider them later.

Comment--I was wondering if in the associate degree program the students will be integrated within the total college. I was perceiving that within this integration some of the other students would decide they'd like to get into this program, at what point would they be allowed to get into the associate degree program, and secondly, it seems to me there will have to be very careful scheduling to determine how many of the classes will be held in the college and how many in the clinical facilities.

M. Montag--We will be talking about the curriculum so a quick answer would be that they will participate and they will be with other students. This is a college based program. There really are no classes at the clinical facilities. That is the laboratory. Regarding transfers--because of the nature of the curriculum in which there is a nursing course in each semester, the person would have to back track to the first nursing course.

Question--How many students can you enroll? Is there some ratio or some guideline about the size of departments within the college that would help in determining how large this nursing department might be. Also, in the division of financing within the junior college. Have criteria been dissolved, are there any guides. Is there an even division of financing or do some departments seem to be allotted more than others?

M. Montag--Let me react to the first part. Mildred Schmidt who has been involved in the associate degree program and did her doctoral study in this area has a figure. She recommends a program of less than a hundred students.

In a public junior college your nursing program would grow as the college grows. In a small private college it might be a problem--the nursing program might outweigh.

Question--How many would you have in each class--you say 100 is your total program. Would you begin a class twice a year, would you begin a class once a year and would you have 20 students, 25 students at any given time?

M. Montag--I would recommend a class--for a beginning--that a program not start with less than 50 students on admission. Probably 60 to allow for attrition. It is a mistake to start too small because you get into patterns and notions. I would admit recommended admission of only one class a year for a variety of reasons.

1) Most high schools have one graduating class.

The basic minimum of faculty is four. 1. The chairman of the department who should also have a teaching responsibility. This is contrary to what some state boards will permit. Each of the other three people will represent other curriculum areas. We will come back to that. The basic minimum is four. Now, how many can they handle as an admissions group. The full complement of faculty does not have to be appointed in the first year--I'm talking about these minimums. At least three of them would have to be appointed--the chairman and two others by the end of the first year. Two in the first semester and one in the second. The fourth in the fall of the second year. I would say that that number of faculty members could take 35 to 40 students and by the addition of another faculty member you could get to your quota--five or six. Mr. Bunnell will answer the other question about the cost per student.

K. Bunnell--There are not a good many institutions that do a good job of breaking down their costs so that they can tell you what a given program costs. We cannot say to a nursing student, it costs more to educate you than to educate a liberal arts student so your tuition will be higher--we average the tuition out.

Let me say a word about enrollment. The basic technique is to relate the anticipated enrollment to the number of students in the graduating class. You take a percentage of the graduating high school classes in the area that are to be served by the community colleges and you can come up with a pretty accurate prediction of students to be enrolled.

Question--What percentage of students who enter junior college have as their goal to continue on into upper division courses. I notice that quite a few of the students who enter the nursing program likewise are taking a considerable high percentage of transfer courses in their liberal arts. To what degree is this prevalent in terms of it really being a technical program or being terminal or having a predominance of transfer courses in the liberal arts?

M. Montag--I think there is some misinformation floating around as to how many do seek to go on. All of our best figures are under 10%. The distinction between transfer courses and not transfer courses is not made in many a community college. It is the second college that determines the transferability.

Question--How do you interpret to voters the need for a community college?

K. Bunnell--This is really where we wish we knew more. I think the question of a community college in Boulder County is dead under the present arrangements. But I'd still like to know how many young people were frustrated in their desires to go on to college because they couldn't meet this upper half requirement or they couldn't afford to go out to these other community colleges. But even if we did have that information it would still be an incomplete picture because you have got to realize that there is a sort of fall out effect from the fact that there is a community college and young people who may even become high school dropouts, if they can look forward to a community college experience in some kind of a technical area--even if it is only straightening fenders on a car--will not be high school dropouts because they have some place to go after high school.

To sell this idea to the voters would be to plan a much more elaborate publicity campaign than we did in Boulder. It is a real problem to get the word across to the people in the community.

Discussion Period - July 25, 1966

Comment--I have one comment and one question. In the southern California area this past year a number of school bond issues and school issues were defeated. The politicians and the people who were interested and concerned about the defeat have inquired into why they did not pass. The general conclusion has been not that the general electorate was not sympathetic with the need but what will probably be known as the beginning of the tax payers' strike.

The question I would address to Mr. Bunnell--if I interpreted his comments correctly--would relate to the question of research and the community college. At least one study has indicated that faculty of associate degree programs have found the opportunity for research, preparation of papers and so on, as one of the very strong satisfactions they find in their work. Secondly, it has been my observation that among the better teachers that I have had, they have had an almost unbounded intellectual curiosity, some totally unguided, much of it guided through unstructured research studies. It can be abused, if abuse is the word, where some medical schools have well over half of their budget financed by research programs. It appeared to me you were making some rather strong comments about no research at the community college level. Should this become a philosophy and a basic policy, is there a possibility that we may in turn be developing teaching technicians rather than teachers. People who are not stimulated by the intellectual curiosity, rather stimulated by the accomplishment of the task. Is there not a place at the community college level for research?

K. Bunnell--My concern is, that the research syndrome not take over the community college. We know that when people get oriented toward research, they cannot be oriented toward the institution that they work for because this is the way the pattern goes. Your loyalties lie with your discipline. This is where you get your kicks; this is where you get your recognition. You get your salary increases based on the number of papers you have written. The research syndrome, it seems to me, would be grossly damaging to the central mission of the community college which is teaching. There has to be a balance.

Comment--I have to say this. I do not want, in any classroom, for which I am responsible, a teacher who is not intellectually curious, a teacher who is not persistently and consistently and always doing research, but that research and I agree with both of you gentlemen, it has to be something which gets into the student. The junior college teacher is sometimes faced with a startling discovery which he makes while he is preparing for a class. Now, a junior college teacher may have to make the decision whether to put that discovery into the form of an assignment for a whole class to love to do--and I don't mean to use the class for the sake of the research, I mean to use the insight for the sake of the class--when that decision faces a junior college teacher whether to go off to a typewriter and write up a brilliant paper which will get published in such and such a literary journal, she may get to do that yet, but if she has to decide whether to put it into a magazine or into a student, I think that she ought to put it into the student and hope that they will put it into a magazine. APPLAUSE.

Comment--You mentioned that it is the measurement of the strength of the community college to have a great diversity of programs and I would like to challenge that. You have also referred occasionally to the junior colleges in California as specialized. For instance, Bakersfield is specialized in petroleum technology, trade tech and trade work. This cuts down duplication. Why does a junior college have to be all things to all men and as a result possibly do all of them with a level of mediocrity?

Discussion Period - July 25, 1966

K. Bunnell--I don't think they should be all things to all people. I believe what I am trying to say is a relative matter. I think it would be cheaper to run a community college that was only concerned with college transfer courses than it would be to run a community college in a fairly complex metropolitan area that was concerned in addition to the college transfer work with a variety of other vocational and technical areas that were needed in that community. My point is, if you do undertake to operate a community college it can get pretty expensive. There are a lot of things that a community college needs to offer that may be duplicated elsewhere but it's needed here. I don't think a community college should offer every conceivable kind of program. On the other hand, if there is a clearly defined demand for a program, even if it only takes a six-weeks refresher course to meet the need, the community college ought to stand ready to meet it. This may be fairly expensive in terms of bringing in the people and offering the courses.

END

# The Associate Degree Program

## An Overview

Mildred Montag
Afternoon, Monday, July 25, 1966

I would like to go back in history to try to identify the how and the why this program began. The purpose of the associate degree nursing program is to prepare men and women for the functions commonly associated with the registered nurse.

This is not the first two years of a four-year program. It is not a three-year program with the third year cut off. This is a new program and it rested on some very specific premise. The first one and most difficult to accept is, that the functions of nursing can and must be differentiated.

Education for nursing belongs within the established educational framework of our country. The community college was the logical institution for this kind of program. Another basic belief of ours was, by concentrating on education, we could save considerable time.

How did we operate? We began by contacting community and junior colleges that expressed an interest in working with us to establish this program. Out of 60 requests we chose 7 colleges. These colleges were chosen to represent the regional accrediting agencies of the country, they were chosen to represent different sizes, different control, different services so that we would have a cross-section.

On the advice of our advisory committee we chose a hospital school with the understanding that the curriculum that they presented and the whole operation they presented would be as nearly like the associate degree program that the community college offered.

We gave consultation service and workshops.

We set down certain characteristics of the program and these still apply. First of all, this program is college centered and college controlled. This means that the faculty of this nursing program are selected as all other members are. They meet the same qualifications. The salary should be the same as anyone else with comparable position. The same responsibilities. They would have all of the advantages.

The third characteristic of the program is the students. The students would be recruited, admitted, graduated and all policies in between would be the same as for all other students on that campus.

The fourth characteristic is that of the curriculum. Again we said, the curriculum should be an integral part of this college. It takes on the flavor and coloring of the institution of which it is a part, but in general we set down certain stipulations and we based these first on New York State because that was where our first program was. In New York State to get an applied science degree, the student had to complete a minimum of 60 credits. At least 20 of which had to be in general education. 6 in biological and physical sciences, 6 in social sciences and 6 in communication skills. The other was an elective.

Another agreement was that the courses in general education should be those that the college required of all students. There would be no exception for the nurses.

We had two other stipulations for the nursing program. They were, that if we were to save time and to make more effective the education, that we should get away from the fragmentation that was so common in diploma programs, so we urged a broad fields approach, larger grouping of subject matter and therefore, fewer courses.

A fifth characteristic was that hospitals and health agencies would be used as laboratories. We were not to be limited to a single hospital.

A sixth characteristic was, that since this was a commuting college, the students were to live at home or in the college approved housing.

Another characteristic was, the graduates of these programs must be eligible for the licensing examination in the state in which the program was located.

The last characteristic was, that the program would be financed as any other program. The student would pay the same cost that the institution required of any other student. We quite deliberately chose institutions having different tuition rates to see whether or not the old notion that you couldn't get a student to go to nursing if it wasn't free would hold.

We carried on this project for five years. Let me now give you some of the results of that program. First of all with respect to the students. We felt we would tap a new reservoir of students. One of the most interesting things that came out in our survey about a month after students came into this program was, not only did we get students just graduated from high school but we had an older age group. The age range was from 17--or a little less--to 59. The number over 35 was significant. This program has continued to attract an older group of students.

Of the total group, 20% said they would not have been in nursing had it not been for this program. More significantly, in the older age group, the married group and in the group of men the number often reached 50% who would not have been in nursing if it had not been for this program.

Told story about 63-year-old woman who went into program and went to Peace Corps from there.

The older age group, interestingly enough, had about the same withdrawal rate. The national average for men in nursing school is about 1% in the associate degree program. I think this is due to two things. 1) These men are not isolated from other men. 2) The nature of the program--the school days--makes it possible for them to take this program. The age span has been the same for men too.

The number of married students has continued to be rather substantial. From the standpoint of students this has been attractive.

Now as for the graduates. We did a rather extensive evaluation study at the close of the project. We looked at the state board test results. In 1957 we

found the percentage passing the examination for the first time was just about that of other students.

We followed them up in their employment situation. We did two things--we developed a form-evaluation--which consisted of some 22 behaviors. These fell into five general categories. One had to do with the act of nursing and we divided that into two parts. One had to do with the nursing which did not require specialized equipment, such as bathing, etc. The other had to do with the manipulation of equipment, such as suction, etc.

Another category was that of communication--their ability to report and record observations. A third--how well did they get along with the various people--their peers, superiors, etc. We tried to judge their attitude toward nursing.

Built into this program was the importance of bedside nursing. We wanted to build in this group some feeling for the importance of direct patient care and satisfaction.

We had no objective criteria for quality of nursing care and so they were compared with people like themselves in experience, etc.

After a year we interviewed head nurses, nursing service, supervisors and the graduates were interviewed. The results to put it briefly was that more than four out of five were as good or better than graduates of other programs. One interesting thing came out of this evaluation study. In the nursing service administrators interviews they separated sharply. If they liked the program, and they liked it or disliked it intensely--if they approved of the program, the graduates were considered satisfactory; if they disapproved of the program, the graduates were considered unsatisfactory. They were the only group that split right down the middle.

This study was reported in the volume, Community College Education for Nursing.

There have been many other studies of these nurses.

About the time the project was about to close, the NLN secured a grant from the Selantic Fund, which is one of the many Rockefeller funds, to continue in essence the kind of service which we had given to the colleges throughout our project. There was no research or no data collecting in the sense we did but they did do consultation and conducted workshops. This went on for five years.

There has been, the most significant thing I think, the Kellogg project, which was the four state, five-year project. The publication of which is the most recent of rather long publications about associate degree programs--the book by Miss Anderson, Nursing Education in Community Junior Colleges. This project--the Kellogg project--was funded to about 1 and 3/4 million dollars and was for four states. They are the four states Mr. Bunnell mentioned this morning as having the most junior colleges. California, New York, Florida and Texas. It is interesting to me, because when we started New York had only one--Orange County was the only community college in the state. There were some technical colleges that have since become community colleges.

This Kellogg project had three main parts. First of all, the consultation service to colleges that might wish to establish programs, and to continue to give consultation service to the programs already established within those states.

Secondly, to support what has come to be known as the planning year. It was highly desirable that at least the chairman of the department ought to be employed and on campus for about a year before the program began. We discovered in the course of these five years that the ease with which a program developed was in direct relationship to the length of time at least the chairman and hopefully, one or two other members of the faculty were on campus before the program started, so they might do the necessary planning, the necessary public relations, and the necessary arrangements with all of these agencies which they wished to use. The colleges found it difficult to support this planning year. The Kellogg project made it possible in each of these states to support the planning year.

The third part of the program had to do with teacher preparation.

Kellogg made additional grants to Indiana, Kentucky and Illinois for the same kind of program except the teacher preparation. Since that time--1963--Kellogg has also and is now currently supporting--some teacher preparation programs for personnel for associate degree programs. I am not sure how much Kellogg has invested in the associate degree program but it must be well over 3 million dollars.

Another--and 1.--is the change in several laws, the laws of several states governing the licensing of nurses. I think the most one to be changed is that of Illinois. There are now only two or three states that have laws that prevent the licensing of these graduates. There may be other states that may have regulations.

Of course these programs had to begin in places where the law did not prevent them from being licensed. But regulations in every state at that point prevented it, so we asked when we went into a state--we asked the state board of nursing for a complete waiving of all existing regulations--time, sequence, subjects and anything else. We got it except in California. They had a three-year law. They did adjust the regulations but they did not free them as much as all the other states.

Another outcome is, that there is as of last June, a year ago, an associate degree department in the NLN. Unwisely, when the league was developed in 1952 they put the A.D. programs in the diploma department.

Another point in progress--there are at this moment 200. This means from 1952 to 1965 we have grown from 0 to 200. There are at this time about 200 baccalaureate programs and it has taken them 50 years to develop.

Just a final word about the Position Paper and the future. In essence, they are supporting our original position that there are two levels of functioning within the nursing occupation. Those are professional, semi-professional or technical and I would use those words almost interchangeably. I see an increase in the associate degree programs. The future of this program is limited only by our imagination, vision and our support. The major problem is that we will need faculty.

Discussion Period - Monday P.M., July 25, 1966

Question--What qualifications should a director of an associate degree program possess. Academically, etc.

M. Montag--I would think the least academic preparation you could accept would be a masters degree. It would be extremely helpful if they had had experience or preparation for teaching.

Question--What institutions in the country prepare people with a masters degree?

M. Montag--There are 56 colleges that offer masters programs in the U.S. Not all of those offer in all areas. The June issue of Outlook that publishes each year the list of approved universities and the areas in which they prepare personnel. If you are asking in which institution is a specific preparation for an A.D. program then the list is far less than 56.

Question--Let us say you can employ a director with a masters degree, could we be satisfied with a bachelors degree for the other two?

M. Montag--No, the reasons are 1) the person with a bachelor degree is prepared for nursing not teaching.

Comment--This is largely determined by the state board.

M. Montag--Not as much by the nursing board as by the college board.

END

The College and the Clinical Area

ASSOCIATE DEGREE

Mildred Montag - Tuesday A.M., July 26, 1966

I've taken a little liberty with the topic today--I'd like to mention a little about the initiation of a program, some factors to consider in the development of a program and some of the things that seem to be discouraging where it is administratively placed before we get to curriculum.

Who initiates an associate degree program? I think I could give you an illustration of almost any group initiating a program. The initiation has come from the college itself and I would think this is the most common point of initiation. It has also come from hospital administrators. The idea has been presented to a college by a hospital administrator. It has come from members of the community--sometimes women's groups. Sometimes doctors. Less frequently, and almost rarely it has come from nurses. The most resistance has come from nursing. College presidents also have reported that they have gotten the least help in seeking for information or advice from the nursing group and interestingly enough they have gotten their most help from the hospitals.

What are some of the factors to consider in the development of a program? Not every community college--private or public--should have an associate degree program. What are some of the things that a person would consider? The first few are not necessarily in the order of priority but pretty close to it. First of all, a belief in the program and an understanding of the program--on the part of the college. And this includes the board of trustees, the administration and the faculty. The faculty must be considered--I think this is important.

A second factor is - is there a need in the community? It may be the community needs a few nurses but not enough to absorb the graduates of a program. Closely allied with this is, availability of facilities. Availability of facilities takes on two different aspects. We are going to talk about the facilities that are peculiar to the nursing subjects, but there also has to be available facilities within the college and available space within the college.

The second type of facility is the hospital. I will come back to that. Where are they and are they accredited institutions. The hospital must be accredited. Then, as important as availability is the willingness of agencies to cooperate. They may be perfectly adequate, close by, but unless they are willing to cooperate and let their facilities be used in a way the college wants to use them then it doesn't make any difference how available they are.

The willingness of the college to finance is important. We've had a long history of colleges and hospitals in some sort of relationship, but often it has been a divided relationship. The college would offer some academic work and then send the students to some hospital--they would have the nursing part there under the guidance of hospital personnel and they would give some sort of a degree or not. On the other hand, some of the hospital schools have gone to a local college and asked for certain courses. In the financing of that, the college has had the students generally in the courses they were already teaching and these students slipped in and were not a particular expense. Or they were paid for this particular course if it was designed particularly for nursing. The willingness of the college to finance must be seen in its entirety. Unlike some other programs within the college this is

a program in its entirety from the beginning. This curriculum has to be seen as an entity and approved as an entity by the approval body in your state.

This is not the most expensive program in the college. It is expensive in personnel. It is not expensive in capital outlay.

Another consideration is that of availability of students. Do students in your area go into nursing? This will vary greatly.

The next step--it may come before some of the other steps--early contact with and approval of state board of nursing. It may be for information only, early in the planning. Eventually, you must have approval in order to proceed--to do almost anything. You must have approval to appoint a chairman. Any nurse educator would expect that this approval had been secured or they wouldn't take the position. Before approval is secured there will need to be a tentative curriculum plan.

The minimum time that you can implement a program of this type is two years because there is a great deal of groundwork to be laid before you can actually appoint a chairman. And if the chairman is to be appointed six months to a year in advance--preferably a year in advance--then much has to be done before there is any decision to appoint a chairman. Incidentally, chairmen are not very available so the hunt for one is going to have to be several months before an appointment.

I'd like to say a few words now about the study Miss Schmidt made. It will be available as a league exchange. It is the factors that have discouraged or encouraged community junior colleges from establishing associate degree programs.

She found in surveying all community junior colleges except those which were for a particular group--the fashion group in New York, etc.--she surveyed to find out whether or not they ever had been interested in establishing a nursing program, had they established one, were they going to establish one or had they changed their minds, and if so, why had they changed their minds, and if they had decided to, when? She found that a vast majority of the colleges that had the idea still were continuing. Very few colleges that had had the idea changed their minds.

Some of the factors that she found that discouraged the program--were within the college and the most frequent mentioned was cost. Some of the others were the board of the colleges--the college faculty did not want nursing. The physical and biological sciences were not offered in that college and it would have meant a substantial increase in their curriculum offerings. The physical facilities were already overtaxed.

In the community itself--there were no hospitals within a reasonable distance. The controlling board of the hospital didn't want the hospital used. The nursing department in the hospital didn't support this kind of program, sometimes because it had its own school of nursing. In some communities there were too few students. Or too few positions for graduates. The local medical groups didn't approve. High school guidance counselors didn't support this kind of program. In some instances the state board didn't approve--that is, they didn't feel that either the college was the right place or they didn't want any more programs in the state.

In spite of these findings that seem to discourage, there were just as many colleges that overcame them. What was the difference? Miss Schmidt found that the most important single factor was the college administrator. It was what Bushell found in his study, "The Prime Mover." Every one of these programs need a prime mover--somebody who is going to spend enough time, energy and interest to keep the idea going and look for ways to get around the obstacles.

Where should the program be placed in the college? This depends on the organizational structure of the college. One of our goals was, to see whether or not it would be possible to have a nursing program as an integral part of a college--operated in the same fashion, having the same opportunities, difficulties, etc. In some colleges it might be a department, a division or it might be in a department within a division of life science, or it might be--this seems to be the trend at the moment--that there will be a cluster of programs for the health occupations.

Where it is in your particular college will depend on your particular organization. The only thing that is an absolute is that the chairman or the department, division or whatever it is must be a nurse.

Now I'd like to go to the curriculum or should we stop and have questions?

Question--Have any of these programs been thinking about developing a program for ward managers?

M. Montag--I don't know of any. There are some that have ward secretaries but that is a little different.

Question--What is a reasonable distance between the facility and the college?

M. Montag--I like Mildred Schmidt's designation of that--she says 50 minutes. This is a class hour and it fits into the schedule.

Let me go on then with the curriculum. We have looked upon this curriculum as a terminal curriculum. Let me define what we mean by terminal. It does not mean that no one is ever going to learn another thing. Or that one can't do something else afterwards. It does mean this--for most of the students who enter and graduate, this will be the last formal educational experience they will have. It does not mean that they will not update themselves, that they will not attend meetings, or have an inservice program, or that they might take a course at the local college. It does, however, mean that it will not be working in a formal program for another degree for most people. And that the program leads to immediate employment.

In the film yesterday you heard a different figure than I gave you--about the curriculum. You heard that the nursing courses, as a general, were 50-50. We started with 1/3--2/3 and practically every program in the country now is almost equally divided between the general offerings and nursing offerings. Why has this come about? Because of the influence of the general courses. The students have learned to study--they've gotten information they can use and they've gotten a way of looking at things. Secondly, the nursing group has been amazed at how fast students can learn when you take away some of the impedimenta that they were burdened with in previous programs. So that the nursing part of the curriculum can be reduced.

As to the college offerings. The student in a nursing program is held to the same general requirements as all other students getting the same degree. This means if it is a church related institution and requires certain courses in religion, this course would be a course in the nursing curriculum.

We have found, too, that most of the requirements for a nursing program are available--I'm talking now about the non-nursing courses--in colleges. We have used and stressed the use of these courses. If a course were added such as physiology, it should not be limited to nurses or geared to nursing students.

Then the question comes up--terminal versus transfer courses. In many of the colleges they make no distinction between the courses which are included in the terminal curriculum and those which are included in the liberal arts or transfer curriculum. For instance, English and Literature would be the same. The question of transfer is one which is met by the second institution.

The curriculum design. The general pattern is to have both general and nursing in both years with a heavier emphasize upon the general in the first year and less on nursing and the reverse true in the second year.

How long should the program be? Two academic years is the pattern in New York State. This is beginning in California and Florida. The largest single number of programs would fall into the length of two academic years and one summer session. The fewest would have 24 months. Two academic years and two summers. When you get to this and look at it from a credit point of view you get close to a baccalaureate number of credits. We had no evidence at the end of our project to support anything beyond two academic years.

There are common characteristics but there are no two programs that are absolutely identical because of the general offerings of the college, and because of the point of view of the nursing faculty.

The curriculum must be constantly under review, constantly revised, and frequently this revision calls for decrease in time because of a different outlook, perspective and way of operating.

Question--What science courses should be in a general curriculum for a nursing student?

M. Montag--Again it depends on what you have to offer. In some institutions they have what they call core courses in science in which they would put together in a single course, elements of biology, physiology, etc. Other, there is a combination of physics and chemistry. The element that should be there is anatomy and physiology. Something in the area of physics and chemistry. If I were to put a priority on those two I would put the priority on physics, not chemistry. We have never given physics the attention it deserves. And then something in microbiology, bacteriology. The general education courses in this are usually more desirable than in the major sequence.

Nursing Curriculum and Facilities

ASSOCIATE DEGREE

Mildred Montag
Tuesday Afternoon, July 26, 1966

Let me make some general comments first about the nursing courses and then diagram a little bit about what the curriculum would look like. Only courses designed exclusively for nurses and restricted to them are what we are going to be talking about now.

We have taken the broad fields approach to bring together like content to avoid the fragmentation which has been so common in nursing programs.

There was another reason than to avoid fragmentation--it would avoid repetition.

Another point that we tried to follow was that we would try to go in the curriculum sequence from the simple to the complex. We would avoid trauma and make learning simpler and more effective.

We identified three major areas of content for nursing courses. These are the areas used in most of the programs. First of all, fundamentals. Second, the maternity and child care, or the nursing of the mother and children. Again, we attempted to make this the normal child and the normal maternity cycle. The third area was that of physical and mental illness.

The emphasize in this program in partial contrast to the baccalaureate program is that there is much less emphasize in this program on differential diagnosis, upon the minor variations with therapy, but upon what the patient needs from the nurse.

We consider that nursing theory and practice are indivisible parts of a whole. The instructor teaches where nursing is taught. We consider, too, what has been called clinical or nursing practice as laboratory practice. And they are planned as any other science laboratory. The credit allotment for laboratory is according to the college pattern.

The content of the courses, then, determines the learning experiences some of which are in the hospital, some in other kinds of areas, or they may be in the college itself. The student is never sent to the hospital to work but always for specific learning experience. The student is at no time a part of the nursing service staff of the hospital. Now, it is obvious that what a student does is going to have a service by product. This puts a burden upon the instructor the like of which most instructors have not faced. That is, identifying specifically what it is a student needs to learn in that laboratory session.

The conduct of the laboratory has some very specific implications. The instructor identifies the area or areas of theory or experiences and then she finds patients that provide these learning experiences. She does this by consulting with the head nurse or supervisor in advance. Not the morning of the learning experience, or 15 minutes before.

This use of a clinical service implies a very close working relationship between the nursing service and the faculty. Remember that all teaching is done by the faculty of the nursing program.

We have found one very useful technique--that is, the briefing of the students before the experience. She comes back to a conference with the faculty member at the close of the laboratory session. They are called pre-assignment and post-assignment conferences.

There is also the college laboratory and the agency laboratory.

Few programs have evening experience and none have nights. Again, when are the experiences available and productive and how do they differ from one hour to another.

We have a rather strong feeling which is not shared by everyone that a relatively shorter laboratory period is preferable to a long one. My own feeling is that four hours is as long as a laboratory period should be.

There is also in these programs an emphasis on the common conditions that are found rather than the unusual or bizarre or the infrequently found. There are some things that should definitely be excluded by having well developed objectives, and unless this experience matches one of your objectives exclude it.

Let us look at some of the facilities that are necessary. Let me talk first about the college facilities. First of all, there is the usual office space for chairman and faculty. This should be consistent with what is provided for other faculty members and what is available within the institution. The second facility is the library. Usually, only nursing books need to be added. The allotment is usually a substantial one because you are starting from scratch. The science laboratories are a third kind of facility. Usually the science laboratories that are available are sufficient. Certainly as far as equipment is concerned. The nursing laboratory--first of all this room should be flexible--it should not be a replica of a ward or a unit, but a room that could serve a variety of functions. There certainly should be one bedside unit. There needs to be only simple equipment, thermometers, medicine covered materials--expendable materials. The capital outlay is a matter of a few thousand dollars--about $5,000.

Facilities other than those at the college. First of all, those at the hospital. The first kind of hospital is obviously the general hospital. No specific size is absolute. You would have to know the distribution of patient within it--what kind of patients, how long they stay, etc. Then there are the special hospitals--most typical being the psychiatric hospital. There might be others--the rehabilitation, orthopedic, neurological, T.B.

Nursing homes--we are going to need to use nursing homes more extensively. This whole area needs to be looked at. There is going to be more demand for more nurses in nursing homes than there ever has been--in any other institution that we have. We are going to have to redirect where nurses are going to work. If they are going to have to deal with these patients as graduates, they are going to have to be equipped to deal with them as part of their experience, as a student. I think we'll not only have to use nursing homes, I think we'll have to use them more extensively than we have ever used them. We'll have to change our notions about what makes them adequate or acceptable. We have in nursing curricula according to the study by Elmore, has indicated that nurses of all kinds, teachers, staff nurses and students have literally avoided the care of older patients. And teachers have literally avoided it in presentation of material because there has been what might be called a rejection of this type of

patient. If the older age group is going to be increasing in size and if this group is to be cared for in homes according to Medicare and in nursing homes and hospitals, the nurses are going to have to care for them.

I think there is also room for other kinds of agencies to be used. For example, homes for the aged--the homes for the aged where the people are living not because they are ill, but simply because they are unable to care for themselves or have no one to care for them. Nursery schools and the public schools. If there are to be more well children and all the evidence points this way, then the experience should be with well children and not the sick children. One program has used effectively an orphanage; another an institution for unwed mothers.

There might be others I haven't mentioned. One used the special classes for handicapped children in school--the hard of hearing, or a class that dealt with some kind of handicap.

One short word about contracts. Obviously, there must be some formal recognition of the arrangement of the college and the agency. Because in no associate degree program--the hospital is not associated with the college in any sense. It is not owned by, operated by, the same board of administrators. It is my recommendation that this contract be the simplest one possible and contain as few specifics and details as possible. What you're asking the hospital for is the utilization of their facilities for the teaching of your students. What you are agreeing to do is to be responsible for all of the teaching that goes on. The contract, in my opinion, should be simple, uncomplicated, direct and entered into with the fullest knowledge on the part of both parties, and the fullest statement of cooperation in the carrying out of the contract. How often should the contract be renegotiated? It seems to me there ought to be a provision for the contract to be reviewed and some provision for terminating the contract should either party wish.

END

Mildred Montag
Tuesday Afternoon, July 26, 1966

DISCUSSION

As for operating room per se they do not scrub, they do not learn the operating room procedures. They are really there for the patient who is undergoing surgery.

Question--Is the experience in the recovery room their only assignment there?

M. Montag--Yes, the student in this program does not rotate any place. When they are having their medical, surgical, physical illness--whatever you want to call it--they are having whatever experiences the instructor indicates.

Question--Intensive care.

M. Montag--It might be they would want to deal with the patient who is having various monitoring devices. You select these objectives, learning experiences and the content which it supports and then where it is available.

Question--Liability Insurance.

M. Montag--I would certainly recommend that all nursing faculty carry liability insurance. I would further recommend that all students carry it. Who pays for this insurance would again depend upon the institution.

Question--Would you talk on transportation?

M. Montag--The transportation of the student is his own responsibility. There are a few places where the colleges have buses. But as far as to and from clinical experiences, in most cases, the student is responsible for his own.

Question--If the facility is 40 or 50 miles away?

M. Montag--They might go by public transportation, private and in some instances the college has provided transportation.

Question--If we were to set up a program similar to this, how many faculty members would we need?

M. Montag--The basic to start a program, regardless of size, is four.

Question--Is the salary range comparable to other _____of the junior college?

M. Montag--That is the principle on which we have been operating--that the nursing faculty should be paid according to the salary schedule of the institution according to their preparation and background.

Question--Do the students go off the campus for any part--for example for psychiatric nursing?

M. Montag--If they do it is the exception.

The View of the Hospital Administrator

Wednesday, July 27, 1966

Mr. Marshall Ause

To have some understanding--I am speaking as a hospital administrator--of the problems of the development of the program is only one part of what has been a very long and at the same time a relatively short development in medicine.

Medicine has been a relatively recent development. At the same time, by the very nature of its structure--dealing with the lives of human beings--it tends to be ultra, ultra conservative. A rather rigid unwillingness to change until it has been proven that the change is justified and that the change will be effective.

I think it was Doctor Admiral Rickover who made the statement two or three years ago that in the last ten years more new knowledge has been developed than in the preceding existence of mankind. This has affected the role of medicine.

In this progress there has been a parallel of time that plays a close role in the area of nursing education. In 1890 there were 35 hospitals with schools of nursing that graduated - _____471 students. Ten years later, there were 432 schools of nursing and those graduated 3,500 nurses. This period represented a period in which the utilization, if not of nursing education, reached a period of growth that has perhaps been unparalleled in the years that have passed. Similarly, in 1873 there were 178 hospitals in the U.S. and by 1909 there were 4,000 hospitals in the U.S. Today in 1966 there are less than 8,000 hospitals so that by 1909 almost half of the hospitals that we have by number had been developed. This came about by Morton who developed the anesthetics, in part by surgeons who found it was now possible to enter a body cavity on elective basis. It became necessary to have these hospitals staffed. Something had to be done to staff these hospitals. In paralleling the need for staff of course were the from 35 to 432 schools of nursing.

In the development of the programs--both in hospitals--it has been difficult to accept some of the changes.

Examples of patterns that have not changed then followed

Discussion of Orange County, California's development of school of nursing.

Someone raised the question, how is transportation provided. Very often small decisions can have long range effects. When the decision to affiliate with the junior college developed in our area, this question also came up. What about transportation? Of the two colleges in the area, Santa Ana Junior College and Fullerton, Santa Ana, really the closer of the two, said there is nothing we can do to help you. Fullerton said, I think we can provide a bus. The decision to affiliate with one of the two junior colleges was not made on really much other than the fact that one junior college was able to provide transportation.

In 1957 the decision was made to abandon the diploma program and enter into an associate degree program and here again the question of prime mover

planned a very important role. Dr. Sheller of Fullerton Junior College was the so-called prime mover. Dr. Sheller has been a prime mover in the school of nursing and in several other areas of the health sciences--a cluster. Now, what kind of problems were encountered? What will the graduate nurses think about the new students? They didn't like them. Real effort was made to find errors in what the two-year student was doing. What about the instructor's attitudes? Initially, they were very distraught at the prospect of the two-year program. What happened to the instructors? Once they were brought into the discussion, once they became part of the planning, they agreed it was practical, would work out, and perhaps they agreed to it after they realized all of them were eligible for employment at Fullerton Junior College.

Part of the psychiatric nursing was done at Metropolitan, the State Hospital. We now have a 95-bed psychiatric unit at the general hospital so that the program is now in large measure a primary affiliation with Orange County General Hospital. There are five other hospitals that have limited affiliations.

Are there any conclusions to be drawn from our experience? Yes, but they would in large measure be a repetition of some of the comments that were made, some of the problems that were anticipated across the country. Certainly, a prime mover is very, very important. Is it important to have the support of the administrator? Yes.

In making changes within a hospital, certainly, I think, one of the greatest errors is not to keep the staff informed about the changes that will be occurring.

Do we like the program? We are entirely pleased and entirely satisfied with it.

Are there any problems that we would visualize? Yes, there are still some reservations about whether or not the girls come with adequate clinical experience. I believe, that a hospital that will be associated with an associate degree program and will be having a number of its students working at the hospital, an inservice program becomes increasingly important.

Are there other problems? There is still the problem of attitude of medical staff. The attending staff still has some reservations about the two-year program. They have reservations about the skills and ability of the two-year student.

Are there gains, are there losses? Yes.

Are there some practical aspects of it? In a diploma school the home hospital usually retains a large percentage of its graduates. The associate degree program affects our recruitment. On the other hand, is the purpose of the program to facilitate recruitment? No, so this is not an objective reason.

If I had my choice, it would be the A.D. program. There are many losses when you lose your diploma program but the losses are not those things that contribute significantly to the quality or the caliber of the end product--the nurse.

In summary, as the administrator of a hospital, I would want to offer the

comment that the graduate of an associate degree program fills her role within the hospital very well. We have a tendency to place more emphasize on the degree than we do on the individual.

Some time in the years ahead, I'm sure there will be another meeting identical to this--the week will be spent discussing nursing education, part of the time will be spent from whence we have come, where are we going from here. Perhaps at that meeting there will be a hospital administrator and perhaps he will make the same sort of a plea that I have attempted to make that this is only one segment in a very long but at the same time rapid development, and that medicine is not a static field, will never remain a static field, but that we must consider our origins in order to have some understanding of where we are going and why. I would suspect that same administrator will refer to some of those very few in number but highly articulate pioneers, the people with the vision and drive, with the foresight to see where nursing must go and to the names that I have mentioned, Nightingale, Dix, Barton, Nutting and others. I have a feeling that one of the very significant names that he will add will be Mildred Montag. I think the program that we are discussing here today represents one of the most significant and far reaching developments in nursing education that has taken place since back in those days when we had 471 graduates in the entire nation.

The Role of Nursing Service

ASSOCIATE DEGREE

Carole Weidner
Wednesday P.M.
July 27, 1966

Telelecture

I am very happy and grateful to have the opportunity of speaking to you this afternoon on the role of nursing service in associate arts degree programs. I had to return home to help in a crisis which is affecting not only my hospital but 29 others in this area. What is happening here in California will soon be affecting each of you whether you are in nursing service or nursing education. The consequences of the actions of these nurses on the entire profession of nursing can only be guessed at at this moment, but I can assure you they will be dynamic and lasting.

I need to point out to you the many improvements and discoveries in the nursing and medical world designed to improve the diagnosis and treatment of disease. Neither do I have to point out the many changes that have occurred in nursing education and practice in the last decade designed to cope with and utilize these improvements. Some have been good and lasting and some have been the products of limited thinking. And yet these are times when frustration and dissatisfaction in the field of nursing seems at an all time high.

In nursing we are all part of a great scheme--that of the health and welfare of society and each of us has a contribution to make to that totality. Our foundation of philosophy, purpose and goal must be centered about the health and welfare of society. While we may achieve our goals in different ways, and make individual contributions, our foundation must be kept firmly and consistently in line.

We are here today to discuss the associate arts degree program, its part and contribution to this scheme. That the program and its graduates are necessary to nursing should not be questioned if the best patient care is to be given. Nursing service, to achieve its part of the goal of patient health and welfare, has a two-fold role to play regarding the associate arts program. First of all, it must play an active role in the education of these nurses. Secondly, it must properly utilize the ability and services of associate arts graduates. To do this, nursing service must thoroughly understand this program, its philosophy, purposes and curriculum. Secondly, nursing service administrators must promote understanding and acceptance of the program by other nurses, hospital administrators, physicians and patients. The role of nursing service in the education of students of associate arts degree programs begins with the belief that the hospital has the responsibility to provide clinical facilities for such educational programs. Preliminary talks between schools and hospital officials will center around clinical facilities available, their utilization and the affect of students on patient care activities in the hospital. Hospital personnel must thoroughly understand the philosophy, purposes and goals of the school, and be sure they are in harmony with those of the hospital.

Preliminary talks are followed by written contracts clearly stating the responsibility of each party. Though this is an administrative decision, the responsibilities are generally divided in this manner. The hospital has the

responsibility for providing and maintaining facilities which conform with the standards of the school and the state board of nursing. It must provide certain facilities, such as office and conference space and teaching rooms. It must allow for participation in the program by the staff and lastly, must help plan, implement and coordinate the program.

The school has the responsibility of planning the curriculum and designating the students involved in it. It is responsible for the supervision and control of all students including legal responsibility for injury or damage to patients as a result of acts or omissions on the part of students. The school must provide medical exams and liability insurance of some kind mutually agreed upon for the students.

Beyond this, and most important of all, the hospital must provide an atmosphere conducive for this. This is achieved by a preliminary and a continued program of orientation of hospital personnel and responsible problem solving. The orientation begins with key nursing service personnel. Faculty members outline and discuss all aspects of their program from the basic philosophy to the specific manner in which the program will be implemented. Nursing supervisors must understand their role in the program and must be allowed to question and discuss any part of the program.

Secondly, there must be an orientation of the faculty to the hospital. This may be done through the usual orientation program of new nurses to the hospital, a special orientation or by allowing the faculty to work for a short time on the unit. The success of her teaching is affected by how well she understands the equipment, techniques and routines of the hospital.

Just prior to the start of the program, the general nursing staff including all categories of personnel must be oriented to the program in the same manner as the nursing supervisor. They must understand their role and the demands to be made upon them. They must particularly understand what the school is trying to achieve, and while they may serve as examples to the students and will be expected to participate in the program in terms of cooperating, the faculty member is primarily responsible for the students and their learning. In return, they are encouraged to take advantage of learning opportunities offered by the students and faculty.

Basic to continued communication and cooperation between the hospital and school is an active ongoing program of continuing orientation and problem solving. There must be a close relationship between the faculty members and the personnel on the unit. We achieve this at our hospital by daily planning and evaluation sessions between the two groups. The staff personnel are made to feel they have a part in the education of the students. Suggestions regarding assignments are accepted if they will fill the purpose of a particular situation. Problems which may occur between the school and the nursing personnel are solved immediately through discussion and conferences. Finally, at the end of the clinical session a final critique between hospital and school personnel is held with the discussion of ways and means of improvement.

Responsibility of nursing service in relation to the associate arts degree graduate lie in the two areas of proper utilization and continued development of this nurse. The basic purpose of an associate arts program, according to Asterrude and Guthrie is, "To prepare graduates who are able to give safe, effective, direct

patient care." They are not preparing graduates for leadership roles. To properly utilize this nursing, the hospital must provide the position of a bedside nurse giving direct patient care with proper supervisory help.

Ideally, a hospital should have a physical setup, a staffing pattern designed for a nursing team consisting of a professional nurse, a baccalaureate graduate with the responsibility of providing leadership in the planning and evaluation of patient care, clinical experience and administration of the unit. It should provide one or more technical nurses, either three-year or associate arts degree graduates with the responsibility of giving direct bedside patient care. Also on the team some auxiliary help such as the L.P.N., aide or orderly to help assist with that care. To provide such a team, the nursing service administrator or the director of nursing must use her understanding and beliefs regarding the roles to be played in patient care by each level of nurse to achieve proper utilization. She must help both the hospital administrator and board understand why the best patient care and the best utilization of personnel can be achieved in this manner.

Distinct job descriptions must be developed differentiating these roles. This must be followed by daily ongoing of individuals and their level of achievement.

Developmental and continuing educational programs for associate arts degree graduates must be both formal and informal. The hospital must provide an adequate orientation program--an inservice education program designed to increase the general professional knowledge of the nurse. In addition, informal on the unit teaching geared to the individual and her immediate needs must be provided. It is probably in this latter area we need more emphasize. While all nursing graduates today have limited clinical experience in their programs, the associate arts graduate probably has the greatest problem. They have a great need for practice in the clinical aspects of nursing. Such as using certain equipment, and practicing certain techniques and procedures. Efficiency and ease with such things certainly comes with practice and the opportunity for this practice must be provided.

It should be the responsibility of the nursing service supervisor to evaluate each individual to determine her needs. Lists should be developed and items checked off when the nurse feels she has mastered the technique or equipment.

Lastly, the hospital must help each graduate develop to the greatest extent possible of individual abilities and talents. Whether this be in the area of better patient care at the bedside or in the area of position of better leadership, she must be encouraged. Improvement and development must be recognized through better positions or monetary gains.

Now, I have described the ideal situation for the utilization and development of associate arts degree graduates and graduates from other programs. Ideal for the nurse and ideal for nurses. But achieving this in nursing service is a difficult job and promises to become more so with the present wage problem.

I would like to point out some of the real problems involved in implementing this plan. First of all, the availability and recruitment of qualified personnel, especially, the professional nurse. Secondly, the problem of the physical setup that lends itself to this plan. Three, definitive job descriptions which clearly

states each nurses role. As you know, overlap in nursing occurs readily and is influenced by the type of patient being cared for and the type of administrative decisions to be made by the nurse. Lastly, but perhaps most important--budgetary problems. We cannot get away from this limiting but very real aspect that controls much of what nursing service is able to provide for patients.

Nurses in California today are asking for wage increases from a starting salary of $440. per month to that of anywhere from $610. to $700. per month. They are backing this demand with mass resignations so that much if not all of their demands will be met. At this time, there are 30 hospitals that are affected in this area. This fantastic seemingly unalterable demand of an immediate 40 to 50% increase in salary will have the following immediate results if these demands are met. 1) An increase in auxiliary personnel salary furthering increasing hospital costs. An increase in hospital rates, although these rates cannot be raised high enough to meet all of the salary demands. This may cause either of two things--a decrease in the number of registered nurses with a corresponding increase of auxiliary personnel in the hospital and a return of the R.N. to the role of supervisor of auxiliary personnel who will actually do the patient care. Or, the demand on the part of the hospital and the public for a much greater performance on the part of nurses. There must also come with this program a distinct differentiation in the salaries paid for professional as opposed to technical nurses along with the personnel evaluation system as to ability and performance with appropriate pay differential. The utilization of nurses will, out of necessity, be more closely scrutinized than ever before. It is my belief, the technical nurses, the two and three year graduates, will be under the greatest pressure. For at these salaries the hospitals will surely hire professional nurses before technical nurses because of their greater scope of ability for utilization. Now I do not agree with much of this nor do I condone it, for the one person, the person for whom we are most responsible, the patient, is the one who will suffer most. And if this is true, then our foundation is surely on dangerous ground. This is a real crisis which will have a most profound effect on nursing for you and for me.

I'm sorry if this seems off the subject of the associate arts degree program. I have worked with the students and graduates of these programs and with each one of them I become convinced that nursing is right in the development of several levels of nursing personnel and particularly that the vast majority of nurses need to be at the bedside. That this stream of better patient care is now jeopardized by selfish, rash decisions based on the narrow value of money alone greatly concerns me. I believe that nurses need pay increases but this is only one aspect of the total scheme of improving the health and welfare of society--our purpose in nursing. It must play its part but not overshadow it. We must remember the other aspects or lose the whole.

Let me conclude by saying again that associate art degree programs and their graduates are very much a part of this totality. And accepting this nursing service must accept its role in their education and utilization.

DISCUSSION

Wednesday P.M. - July 27, 1966

QUESTIONS

Question--I am from a junior college in Kansas City, Kansas--Donnelly College. You speak of the hospital's responsibility in helping this technical nurse accept positions of leadership. Would you elaborate a little? If the associate degree nurse is trained for bedside nursing, on what level of leadership do you think she could be expected to function and how would she be prepared?

Miss Weidner--I feel that among the associate degree graduates there are going to be individuals who show leadership potential in terms of nursing. I think that these people must be encouraged and this would be on the level of more education to be able to show and use their abilities and talents. The statistics have shown that this is a small percentage and certainly we do want these graduates to stay at the bedside. But I do not feel that we should take away from that individual who is an associate degree graduate who obviously shows a tremendous amount of ability for future leadership in nursing. I feel this person should be encouraged and recognized by the hospital and even be given financial support for further education--whether this be on the level of workshops or on the formal level of a baccalaureate degree.

Mildred Montag--The other day when we were talking, you made some points relative to the physical setup. I wonder if you would say a little bit more about how you think, perhaps not just your specific one but that physical, might affect the utilization and the ways in which the hospital might need to orient.

Miss Weidner--I was telling Miss Montag about the particular physical setup in my own hospital which does not lend itself to this ideal I was talking about--the team consisting of the professional and the associate arts degree nurse. This is a physical setup which is divided into 12-bed units and the nurse involved--the staffing pattern generally is a registered nurse and a licensed vocational nurse for these 12 patients. But this necessitates that all R.N.'s are working at the same capacity and we have had experienced where this is too demanding for the associate arts degree graduate because it does entail a certain amount of administrative detail and it is not challenging enough for the baccalaureate degree graduates.

I was telling Miss Montag that the problem as far as the design of hospitals is concerned is the fact that the values or ideas that go into the planning of hospitals, as far as administrators, boards of hospitals, hospital engineers, etc., are different. But I'm not all together sure that the primary thing they are thinking of is the utilization of nursing personnel, particularly, the different levels of nursing personnel. So it behooves the nursing service administrator, the director of nursing, to attempt to explain and help these people understand why this is so important--that the physical setup of a hospital must lend itself to this type of nursing team in order for the proper utilization of personnel and best type of nursing care to be given. I think this is her responsibility and one she should assume if she is at all involved in the planning of a hospital.

Mildred Montag--What proportion of your staff is composed of associate degree graduates as of now?

Miss Weidner--It would be difficult for me to give you a percentage. Of 75 nurses we have approximately 7 or 8 associate degree graduates on our staff and they come from 4 different programs in this area.

Discussion
Wednesday P.M. - July 27, 1966

Mildred Montag--I assume then from that that you are orienting different kinds of nurses from time to time--that is, diploma graduates or associate degree graduates. Would you say a word then about the orientation program, do you see any great difference in the need for orientation and continuing education--I am talking about new graduates?

Miss Weidner--As I pointed out, graduates from nearly all of the programs of today have limited clinical experience because of the demands for the amount of time on theory, and certainly the associate arts degree graduate has a very real problem with this. There are similarities among all of the types of graduates as far as needing practice in basic techniques, physical things, equipment and this type of thing. There are some differences that show up between the three types of graduates. Of all three, the three-year program graduate feels more secure faster on the units than do either the baccalaureate or associate arts degree graduate. They have had more time on the units with patients and they do not find it quite as frightening.

Mildred Montag--You so often hear about a need for orientation program for the associate degree graduate--you so rarely hear it about the other graduates. And it has been my position that any new graduate needed some orientation if no more than to the physical plant.

Miss Weidner--Yes, all graduates need this orientation. It takes a while, no matter what program they graduate from, to become used to the role of graduate nurse. They need this time to go from the student to the role of graduate nurse. Here in California, as of last January, new graduates, until they have completed and gotten the results of their state board exams, are no longer able to practice as a non-licensed graduate nurse. They have various titles like nurse intern and other titles. But this gives them approximately six weeks between the time they take state boards and get the results and it affords an excellent opportunity for orientation. They are working on the wards in the role of graduate nurse but they do not have the responsibilities. They do not give medications nor are they put in the position of responsibility. We are utilizing this in our hospital as the orientation time for these new graduates and we are not discriminating what kind of program they come from. We utilize this time to allow them some practice on their techniques and experience in this manner.

Question--I am Bruce Carter of Northeastern A.M. College, Miami, Oklahoma. We are very much interested in knowing what it is like in a great hospital to have a hospital without nurses. We would like to know what it is like, what is going on and can you tell us how long this situation may last and how long can you operate without nurses, and how is the strike progressing?

Miss Weidner--As of this point, our nurses have not left. They are not due to leave until a week from today--August 3, 1966. When you question these nurses as to why they are doing this they make two points. 1) They feel responsible for the patient and his care but 2) they have to quit because they have to support the nurses. I don't know how they intend to solve this conflict--quitting on one hand and taking care of the patient on the other hand but this is the feeling. You also get the distinct feeling that these nurses really don't believe they are going to quit next Wednesday. They feel there is going to be a miracle happen.

Discussion
Wednesday P.M. - July 27, 1966

There are 30 hospitals involved in this. The California Nurses Association is the negotiator in this. They have come down in their demands from $700. per month to around $670. There are some 30 other demands in the contract. They are insisting on negotiating all wages and all 30 other demands with the totality of the hospitals at one time. They will not do any individual negotiating.

The last offer which was made last night by the hospital council was to develop or set up a fact finding committee to study the problems involved and they would come back and have a final contract by the 31st of December to go into effect the 1st of January. On an interim basis, a raise with a starting salary of $500. per month going up to $590. This was rejected without comment by the California Nurses Association so we are at a stalemate.

At our hospital we have a certain number of nurses, about 10 who are staying on duty. We have all our supervisory help who will be doing general duty. Our auxiliary help will not be leaving.

We intend to curtail our patients to the emergency rooms, intensive care, all of O.B.--we run approximately 225 babies a month so we must keep this area open--pediatrics, and one 24-bed medical-surgical unit. We will admit only emergencies, no elective surgery, and the doctors will be doing some of the actual nursing care involved.

Question--I am Esther Dion. I am presently associated with a diploma program in Denver. You have made a comment about the need for acceptance. Could you say a few words about how the associate degree graduate is accepted in your own hospital by medical staff as well as by nursing staff.

Miss Weidner--Yes, whether we are fortunate in terms of the associate degree graduates that we have in that they are excellent nurses, I don't know, but I think they have complete acceptance by the medical staff and by the other nurses. Certainly, having the program here helps to a certain extent. Primarily, the associate degree graduate sells herself. I think she understands this is necessary; that there are people who do not understand her program; people who are antagonistic and these people do a wonderful job of selling themselves by what they do and how they do it. They show they know what they are doing and they give excellent care.

Question--I am Zelma Allen, a director of a diploma program here in Colorado. I was intrigued by your statement about nurses not functioning as registered nurses until they had heard from state boards. Now, is there a salary differential during this time and how much?

Miss Weidner--Yes, there is. It is on an individual hospital basis. In our hospital they make $40. less than the beginning salary of a graduate nurse. At other hospitals they are getting the salaries of L.V.N.'s and other special categories.

Question--I am Mary Flowers, Colorado Springs. What percentage of the girls graduated from the school associated with you goes into hospital nursing?

Miss Weidner--They came out with the statistics and it is over 90%. Of the total number questioned, only about 3 were in office nursing and 1 only had gone on to further education but 90% were involved in hospital nurses. Not only that, but they were involved here in California. So this is another thing in favor of

associate arts degree programs, they are staying where they are being educated and they are working in the hospitals in the role that they were prepared for.

Mildred Montag--This is not so much to ask another question but to add another figure to what you just gave. In a recent study in New York City, well over 3/4 of the associate degree graduates employed in the city--not municipal--hospitals were engaged in staff nursing and most of those said they spent most of their time in direct patient care.

Miss Weidner--I think this is very impressive. Certainly from the standpoint of nursing service. This is a group of nurses you can depend on; they are going to stay with you and are going to be happy and satisfied in giving patient care. It isn't always easy to find this type of nurse.

Mildred Montag--One of the things that has been tried in the associate degree program is to increase the prestige of the person who is going to do direct patient care.

Kaleidoscopic View - July 28, 1966

Mildred Montag

This afternoon I have tried to group the questions that have come in from the various groups and sessions under some kind of heading.

Newer teaching techniques--Let me start with television. This is not a new technique and in many respects it is not a new technique in nursing. I would like to comment on what is a new way to use television and that is the experiment which is, in part, still going on at the Bronx Junior College. This use of the television really turns the thing around and puts the multiple cameras in the patients' rooms and the teacher at the monitor. So, instead of the students viewing the teacher, the teacher views many students. The cameras are covered unless the student and faculty are engaged in a class teaching. This is to prevent any possibility of it being used for reasons other than intended, and also to protect the patient and his privacy. All of the patients used in this area were notified and gave their permission.

In the distant room where the teacher sat at the monitors--one monitor was kept rotating about every 6 seconds so that in the course of a few minutes all 16 students could be seen. While at the same time a fixed monitor could stay on a student for whatever length of time seemed warranted by a student's need or the instructor's teachings. There is communication between the student and the teacher. The student wears an ear piece with a pocket battery so the instructor can talk with the student whenever she wishes. There is a microphone on the wall which picks up much of the conversation--some but not all--and into which the student would speak if they wish to do so.

This experiment went on for three years. The upshot of this is that, the student learned as well if not better with this kind of teaching in the laboratory. The teachers felt they had done some of the best teaching they had ever done in this methodology. The time spent with the students exceeded the time spent in the normal usual contact. There was much more opportunity for communication and observation and for teaching.

At the end of the three year period a video tape was added. They can video tape any or all of the student's performance, and in minutes can have that performance in the classroom or in the post conference for review or analysis or later for evaluation.

The cost of this equipment is relatively little. The cost of the cameras and the monitors and installation--not the video tape--but everything else came to $30,000. The cost today might be less.

This, I think, has an unusual possibility in teaching and trying to extend and improve the teachers' ability to teach. The teacher has to develop a whole new methodology of teaching. The teachers found themselves developing a different way of talking to the students.

Question--In nursing service are they using this to monitor patients?

M. Montag--Not in this particular instance. This was an experiment and used only for teaching. It was not even used by the medical staff.

A second kind of technique that is promising great things is the area of programmed instruction. There are programs now in asepsis, aids to diagnosis, oxygen, the administration of a hypodermic and this is the only skilled one I know of. There is one in arithmetic called, An Arithmetic Review by Lypsy.

The degree to which these will be helpful will depend on how fast they are produced. There are not very many of them available at this moment.

It seems to be some of these programs should be prerequisite to and does not take class time. This is another way in which we could save class time. That the student might have to come--this might be in advance of their arrival in the fall--and be able to pass a test for which they will have prepared through a program test on arithmetic review for nursing. It might be used to supplement. It might be used as a substitution. So the many uses of program instruction certainly make it a tool with which we should be familiar and which we should try to use. Let the student do this on his own--he will have to be tested, of course. Keep your eyes open for what is available in the area.

A third new method is one to which reference has been made and that is this question of multiple assignment. Maura Carroll at the University of California in Los Angeles studied the possibility or ways of extending the instructor but also making better use of what might be limited facilities. That is, if you don't have 25 patients of whatever kind you want, you can make effective use of what you have. She planned this with a control and experimental group where they would assign to a given patient from 4 to 6 students in a team sort of relationship. In this instance they would work together and each would do some phase of this patient's care. One might do the hygiene of the patient, one might give the medication, one might be responsible for the knowledge about and communicating with the others the history of this patient's problems and the knowledge about the drugs, so that as a grand total this team worked together and planned together and gave care to that patient together, so that there were as many as 18 students to an instructor but there were only 3 or 4 teams. This worked very well. The students were as well taught. The patients were as happy. The instructor had to make fewer contacts with fewer people.

This experiment has been carried on in other areas in somewhat different fashion. It has been done with considerable satisfaction and success. It does two things, I think principally, as far as the teachers are concerned. It extends the teachers' contacts with the students. She has to make less contact and accomplishes more in the contacts she makes. Also, it offers opportunities for lesser facilities. This may be one of the answers.

There is a short article about this in the issue of Journal of Nursing Education by the Florida group.

Question--Can this be used on beginning students?

M. Montag--As far as I know they use it on beginning students as well as older students.

Question--Do they use the observer in the room?

M. Montag--Yes, upon occasion.

The next method is not new but I do want to mention it--films. The possibility of the 8 mm films--the cartridge--are of tremendous possibilities. I can visualize

combining a series of methodology within a laboratory with a tape recorder of directions and some of these films--they could be played over and over. The kinds of things that could be nursing in this are unlimited, but it takes some imagination, some vision, but it doesn't take much money.

Those are some of the newer teaching techniques that have had some experimentation. There may be many others, but those are the ones that have stemmed rather directly out of the associate degree program and offer a great deal of promise.

There was some question about not getting clear these three areas. I mention the three areas again. These are actually the areas in a different organization that we have always had. This is not really anything very startlingly new and it isn't what I can envision as a possibility with a baccalaureate curriculum. It is simply the area of fundamentals which represent those activities, functions, tasks, procedures which are common to all patients. Then the maternal and child area which is the maternity cycle. The whole period of prenatal, delivery and the postnatal period, and the care of children. And because children are increasingly well and are increasingly treated for preventive medicine, this course might well deal only with the well child.

DISCUSSION - Mildred Montag

For example, the multiple assignment is one way to have fewer patients and fewer places used. Another is to remember that the learning experiences need not be identical in order to achieve the same objective. Fundamentals are fundamentals and this can be done in any unit, on any diagnosis, any age, any place where there is a patient. If a person needs nutrition, he does and at all ages, the variation comes either with age or with condition or with the pathology. You don't have to have everybody on a medical ward if you are teaching fundamentals.

If you are teaching in another area such as maternity they will not all be having their experiences with patients in the same stage of this period of pregnancy at the same time. But this is all part of the maternity cycle. The same is true of children--you can't possibly have experience with all ages of children in a given curriculum. One group might be with one-year olds, another with two-year olds, some in a nursery, others in a day-care center and yet others in a pediatrician's office where health supervision is going on. They are all meeting the same objectives.

It is my belief that Leadership Skills are not appropriate for this program. There are leaders in all areas and at all levels of education, but to formalize and to prepare for and expect these people to exert leadership skills I think is inappropriate for this level of education.

The question of internship came up. The St. Petersburg Junior College in Florida. They phased out a diploma program and into an associate degree program but maintained an internship under educational auspices and they provided faculty--four--for this internship. They began to look at what this was costing and what it was accomplishing and what the intern could do. As soon as they could get rid of the contract with the hospital it was discontinued. And if you want a very good argument against internship, I suggest you write to Nancy Hartley at St. Petersburg Junior College.

The internships that have been few in number have disappeared for the simple reason that all the studies that have been done, ours plus the one by Miss Zimmerman, is that in a few days to a few weeks the individual--the graduate--is fully capable of carrying the work of the registered nurse. And there is more difference between individuals than there is between programs. There is no evidence to support an internship.

Question--In the Position Paper it does say the technical nurse shall include in her functions supervision of others.

M. Montag--I was not on the committee, I don't know how that got in or why. I don't know the rational behind it--it doesn't seem logical to me. In fact, as I have discussed within the past few weeks--my basic question is, is the supervision of others a basic component of any professional program? This I am ambivalent about. If you look at professional education, is the supervision of others an integral part of that preparation? I don't think it is. Look at law education. Do they learn to supervise law clerks? We have written it into our professional education and we have put it in as the function of a professional person. What I'm not sure about is, does it even belong there. If it doesn't belong there, it certainly doesn't belong in the other. I don't know what they mean in the Position Paper, really.

Let us move on then to the business of public relations. I think there needs to be an almost continuous dialogue between the college and hospital and the various levels of personnel within the hospital. It isn't enough for the hospital administrator, director of nursing and the inservice person to understand this program, the staff nurse must understand it and the aide. This has to be interpreted and reinterpreted. In addition to this, there needs to be a considerable interpretation of this in the community so that there is understanding in the community of what the program is, the kind of students it will take.

Closely related to this is the relationship with hospitals. The preparation of the hospitals to utilize the graduates is the responsibility of the college, at least to initiate it. Let me tell you what has been done in some places to help the hospital and its personnel at all levels to understand this program and utilize it better.

Several years ago when the program in the New York area was expanding, we invited a representative of each of the hospitals and other agencies that might be employing graduates and we invited representatives of the hospital that were being used by the college for experiences and we had a one-day session. We had the college people explain and interpret what the program was like and included--the kind of skills the graduate would have. The second half of the day was turned over to the hospital people and we had representatives of hospitals that had employed these people and they indicated how they had utilized these graduates--how good they were, where the problems were and we were trying to get a better understanding on both parts.

At St. Mary's Junior College they started to work last Fall to gradually introduce and interpret this new graduate who would appear in June to the possible employer, so that there would be no reason to say, "I don't know what this person can do."

These methods have been reasonably successful in preparing the hospitals for the graduates before they arrive on the front steps and expect to be employed.

I think the graduate needs some help too in knowing what is expected of them. It is in this area that some of the programs have a seminar in the last semester, some try to incorporate it, some do it on an informal basis.

There have been some questions about phasing out a three-year program and initiating associate degree program.

It must be recognized and accepted that when a two-year program is to start in a college in the area that the three-year program will close. Now that doesn't mean it will close over night but it means it will cease to exist and a new program is born. It isn't a question of transferring one to the other. This is where it is difficult, mostly for the alumni. Not so much for the faculty, not so much for the students at that point, but the alumni because their school of nursing is going to go out of existence. I see no alternative to this...one school ends and another begins.

My observation has been that usually the first of the A.D. program graduates and the last of the diploma program graduates seem to coincide. The three-year program phases out by not admitting a class; the associate degree program begins. By the time the first associate degree graduates are ready the other will have their last graduation. Numerically you may be guided by this. That is, you may need to gear your first class group to be no less than what has been produced before. You certainly can't look as if you are producing fewer graduates because that builds up all sorts of feelings of not meeting the needs of the people.

This question was asked--when do you tell the students of the program that it is closing? The students ought to be informed as soon as the decision is made--not, necessarily, long back in the discussion stages but when it is reasonably certain that this is the action.

There is a question of who is notified in such an instance. I would assume the first to be notified would be the state board of nurse examiners. They would need to know this school was no longer going to operate after a certain date. The alumni association would be informed. They would have known it was in process before this, but they would need to know. Certainly, the students in the program itself. It isn't going to affect them, but it might well be that the schools from which most of the students come--that is, the high schools in the area would need to know that this school was no longer admitting students.

An interesting question has been raised as to whether or not in the phasing out of a diploma program and the instituting of an associate degree program that the same director can function in both programs. I don't see how this could be possible. I think it would demoralize the diploma program, and I don't see how they could give enough time to the ongoing new program to do both jobs at once.

A fundamental question has been raised--how far should you go for facilities. I say far and I don't mean geography. I don't think there is any merit simply in proliferation of agencies. The reason I have brought up the question is to raise with you the question of whether a contract has to renegotiated every year. It might need to be reviewed every year or two years but not necessarily renegotiated every year.

I did not comment on health policies. I think the general practice has been to require a physical examination on admission by the family physician with such immunizations as might be indicated by your policies, x-rays and similar tests. Because of the nature of the student body, most of whom are living at home, there is less need for this extensive health provision than there is in a residential college. So the chief thing in the health policies is the physical examination and such immunizations as might be indicated prior to their admission or at such time along depending on the rules of the hospitals.

Another question--where in the catalogue should the philosophy of the nursing program be? The statement of philosophy in the catalogue will depend upon the policies with respect to catalogues. Some schools have much more extensive divisions for the different majors, some simply list the majors with the curricula and then the courses. In our particular catalogue we are able to have a rather brief introductory statement. It is not the full statement of our philosophy which we have in writing, but it is not in the catalogue in its entirety. You will have to be guided in part by the procedures in your particular college.

I have left this choice one until last. Given a class of a hundred entering freshmen and adequate hospital facilities, would you outline the time and space arrangements for a six-hour course in fundamentals. If I understand the question, a six-hour course in nursing would, I believe, be divided either equally between the so called theory and laboratory or a four two, and probably a four two. Which would mean four hours of class and two hours of laboratory.

If you divided a class of a hundred into four parts--which would be a rather difficult thing; probably not four 25's, but a hundred divided into four parts--24--26 instead of 25's in order to have pairings that you could divide more easily than 25.

If you had the kind of television that I spoke of you could have a hundred in one class. They did at St. Mary's but they had about 5 television monitors in that room so that the group of students around a monitor was about 8 or 10. And one group could see the demonstration first hand.

If you do not have such facilities but have an amphitheater type of arrangement, you could have all hundred in one class at one time even if it were a demonstration.

If there were smaller group discussions, you would need smaller facilities. Except for the nursing laboratory, I don't see any space requirements for the fundamentals course other than the classrooms that are already in the college. I am trying to visualize various programs and various facilities that I have been in.

I am assuming this question had to do with space requirements at the college not outside, so this means you could have the group divided into four and have four lab sections. The laboratory--if you were going to have working on each other arrangements--you would need 12 units so that two people could share in a unit. Have all movable chairs--nothing fixed, the units could then be moved at will, used for that purpose during the time you needed beds--out if you don't need beds.

Does that seem feasible? Would anyone like to react to this?

Question--How and when would you use say the physics lab or whatever lab you are going to use, within the scheme of the whole thing? You don't need it for fundamentals?

M. Montag--No, if they are going to have a course in physics...

Question--They would be with the other physics students?

M. Montag--Yes, they would not need the other laboratories.

Question--Would you ever require any other lab space other than your classrooms?

M. Montag--I can't visualize any. Can any of the rest of you? The thing that you teach in the nursing laboratory is nursing and if you are going to use one of the physical principles, you are going to use it in connection with nursing equipment not with physics equipment.

Question--You would have to use the hospitals in all these courses?

M. Montag--Yes, the hospital is used in all courses. Less in the care of children than in the care of the sick adult.

Question--Some of our programs--degree programs especially--have done away with the need for nursing art labs. How would you feel about it here?

M. Montag--The first trip I made to one of the California programs they bragged about having no nursing lab but now they have one. I think they found out that there are some things more expeditiously taught in the laboratory. I think this taking of everything to the hospital has been one of the most wasteful things we have ever done. Unless you need a patient, why go there? For example, take medications. Why do we teach them how to pour medications in the middle of a busy ward in a little cramped medicine room when you could in a laboratory way teach them all the skills of pouring medication. To know and be able to handle equipment with some degree of ease--the hypodermic syringe, how do you get the fluid out of the vial, how do you get your fingers around to push the plunger? This doesn't have to be with the patient and it is much better for the patient to have someone come with some degree of facility in this. There are some things that simply can't be done except with a patient. If we can determine the difference between those that can be done without a patient up to this point and then where the patient is required, and those which require a patient from the beginning then I think we can expedite our teaching greatly and we would also reduce our time on the wards and the patients needed.

In any given course, if you could think of that knowledge or those skills that a student could be expected to get by himself by assignment or by direction but could learn all by himself--we discovered in the asepsis, for example, that they could learn the whole business without a teacher.

The next category is what do they need to have some opportunity to discuss in class? The third is, what can you do in the college laboratory? Plan patient care. What do you need a patient for? That is what you go to the hospital for.

Question--Is there an advantage in using more than one hospital if one hospital is adequate?

M. Montag--From the standpoint of staff--no because you do increase the staff with the number of different facilities you use. If the one hospital has everything you like and want, I can't see any particular merit in more than one. Certainly, I can see some great disadvantage in being so spread out that you have faculty all over. The basic question is, where are the facilities that you need? Don't settle for one hospital if it takes two to get what you want. This may be one way to expand the program. That is, when this facility is used to its utmost, then in order to expand the program you may go to another, but with that expansion you would expect more staff anyway.

I don't mean to be giving arbitrary answers because there isn't any arbitrary answer to this. There is no one road to Rome. There are many, many ways to do this.

Question--Would you elaborate a little bit on the mother-child breakdown, lecture lab time and also on the physical, mental illness lab breakdown?

M. Montag--I would imagine any 6-hour course which the maternal and child frequently is, say a 9--which is an arbitrary number--I would say it would be 5 or 6 to 4 or 5. Again, this depends on the objectives of the course and the ways the faculty would best see it accomplished. If you have a summer session, you might not have any course as large as nine credits.

Question--Would you elaborate on the kinds of learning experiences they would have?

M. Montag--Without going into details, the fundamentals course includes such things as hygienic care which would include bathing, care of the mouth and teeth, nutrition, vital signs--the taking of temperature, pulse and respiration--, rest--measures which would induce rest and sleep, comfort, turning, lifting, moving of patients, positioning which involves body mechanics and proper alignment of the body.

I think the need that is greatest in nursing education and nursing service is vision and imagination. An imaginative, creative visionary teacher will find all kinds of ways to improve and utilize the facility. And we need this desperately.

Mildred Montag
July 28, 1966

Mildred Montag--You will note in our project report that we had rather a wide range of ATC scores. In some of those colleges, testing was done preadmission and some at admission, although there had to be a certain high school level. Again I repeat, the motivation of these people to go to college or to become a nurse has been pretty strong. In fact, at the Bronx they said that some of their problems came from overmotivation. That the student was really taking on too much and couldn't cope with the family situation and college work, etc. My own feeling is that there ought to be some sort of selection devices, tests, grade school averages or some combination of, and keep a record and see what point students have difficulty.

The question of interviews. There seems to be no evidence that interviews are of any particular value. Can we not use more effectively than we have the college admission procedures, the college admission staff.

What about the standards once they are in? I think this is a bigger problem in the nursing courses than it is in the other courses. Certainly, the same standards, same requirements, the same privileges, if you will in respect to standards, should apply to nursing students. If we have clearly developed objectives and if we have clearly defined methods of evaluation, then we have some basis for making a judgment as to whether or not a student is meeting the objectives. If they don't meet the objectives, we have no alternative but to say this course has been unsuccessfully completed.

The same standards for graduation, obviously. The same opportunities for being on the Dean's list or honor's list.

The students' opportunities within the college situation. I said earlier that very often nursing programs have been in colleges but not of them. And students have been virtually unable to participate in what are the normal college activities of students because of the impossible schedules we have had for them. When you make a schedule that requires a student to be some place for 38 hours a week, it is not very realistic to expect them to participate. The very schedule may prevent it.

We have adopted the belief that the person should be educated three ways--as a person, as a citizen and as a worker. To be denied any one of those three seems to me to deny them of their educational opportunities.

Question--The admission of practical nurses to associate degree programs.

M. Montag--I doubt that there has been a program that there has not been licensed practical nurses admitted and in many instances nurses aides, and in quite a number of instances persons who have not, for one reason or other, completed the typical diploma program. Generally, there has not been difficulty. One word of caution, the predominate number should not be practical nurses. Also, you would not want the predominate number to be beyond the average age. But a goodly representation of those would be quite acceptable.

Question--When a student fails a particular course and that course is given in a particular semester, what happens?

M. Montag--Just what would happen in every other course. It may delay their completion, but they have to wait.

Question--Does any program permit the part-time student?

M. Montag--It is not really recommended but it might be done on a part-time basis.

Question--If a student has had all the general courses, could he take the nursing course?

M. Montag--Yes, it is unlikely they would have had all the science, but they may have had the psychology, sociology and English.

Question--What about a student transferring from one associate degree program to another?

M. Montag--I see no reason why they should not transfer from one to another. Where they move into your program would depend upon the program from which they came.

M. Montag--The question is, this upward spiralling from associate degree to masters degree. I do not anticipate that any substantial number of these people will seek further formal education. The masters candidates are coming out of the baccalaureate program. The purpose of this program is not for transfer. The purpose of this program is to prepare a practitioner who, in various and sundry ways, will advance in salary, advance in ability, advance in skills, but will never, necessarily, seek a formal education program leading to another degree.

# The Role of the State Board of Nursing

Madolin M. Dickinson

Friday, July 29, 1966

We have to keep in mind that the State Board of Nursing is the legal body responsible for the accreditation for schools of nursing. The law is a state statute and this is one of their very important functions--the accreditation. In order for a graduate of a nursing program to be eligible for licensure, she must be a graduate of a state accredited program. This is true not only in Colorado but also in the other 49 states and territories. So that working toward accreditation very early is important.

In the law it is not written that a school must be accredited to be open. It says they must be accredited if they are going to write the state board license exam. It would be foolish to have a school that was not accredited because their graduates could not go anywhere, so to all intents and purposes it is mandatory the way it is written.

Boards, as a whole, tend to be more open minded than in past years. Today we are able to benefit and approach accreditation from a different viewpoint.

There are certain things written in our own regulations that must be met--we call them guiding principles. We also use the National League for Nursing material. When we are on our very first consultation visits whether it is a new program or an ongoing program, we ask them if they have seen the material from the National League for Nursing. For example, their accreditation of the A.D. program. We try to begin working with the school personnel so that they will be looking forward to the day, if they wish to go ahead and apply for accreditation, they will have a sound enough program that they can become accredited. We are really working with more than minimum standards.

The way the law is written, we cannot write three sets of criteria for schools. Maybe we would like to but the way they have to be broad and basic and this is why I feel the need to use the league material in working with different programs so they will meet different levels.

All states do have minimum regulations for the accreditation of schools of nursing. They do vary from one state to another but through the committee of state boards of nursing of the American Nurses Association there has been an effort made to have some degree of uniformity in the regulations.

Most state regulations do set forth the criteria for a new school of nursing. For the people who are familiar with it, I think one of the best things that ever happened as far as boards and states, is this committee made up of 50 people--one professional nurse representative from each state--that meet once a year, always before conventions in which we discuss common problems, try and arrive let us say at the same passing score in the examination for all states so that people can move freely. We also try to arrive at what kind of clinical experience may be required.

This large group has many subcommittees that work very hard all year.

I would like to read to you Colorado's philosophy of accreditation:

1. That it is the responsibility of the Board to provide leadership and insure high quality in nursing education programs.

This is one reason that it is so important that a board is made up of people who are educationally qualified; that you have a certain number of people on the board that are in different types of nursing education programs to provide leadership. They must have an understanding of nursing education.

2. The required process should contribute to the improvement of nursing education programs and stimulate faculties to continuous self-study, evaluation and appropriate change within the program.

3. The purposes of accreditation are:

a. To give legal recognition to those schools meeting the required standards of nursing education as determined by the Board. b. To encourage faculty and schools to engage in continuous self-study and evaluation and appropriate changes. c. To insure graduates of the school admission to the licensing examination. d. To facilitate interstate registration.

We believe there should be area wide or state planning to demonstrate the need for a new program. That new programs should not just start up because some community thinks it would be nice to have a school. Schools should develop in an orderly fashion.

Our Board regulations are very specific regarding a new school. The first statement reads: "Any agency considering the establishment of a school of nursing shall inform the Board and should seek counsel of the Board in the initial planning of the program."

'Seek counsel of the Board'--we do know resources, if a school has questions or problems or needs help in initiating a program, we are aware of where they may seek consultation that may be helpful to them. We can bring people together. We are aware of where there are funds available to help finance programs.

These very steps in the process of establishing a new program are necessary, if the school is to receive interim accreditation--which means they may admit the first class of students. This interim accreditation is very important because it does insure the group of students admitted to the program that they will be permitted to write the state board licensing examination even if that school does not receive full accreditation eventually. The student who enters the program has the right to take state board examinations and practice as a registered nurse. This is one reason why the interim accreditation is extremely important and should come very early. We have a very simple application form that consists of one page and is sent to the college that is proposing the new program.

Usually before this step is taken there have been several conferences to consider future plans. We have informal conferences long before we reach the stage where they are going to fill out an application and this has been wise. This application is signed by the appropriate administrative officer of the college.

The Board asks the college what their purpose is for establishing a nursing program. We want to know--do they really believe that nursing education should

be in an educational institution and supported, or are they getting on the bandwagon.

The Board is interested in discussing why a particular college wishes a nursing program and what purposes it will fulfill in this community. It should be meeting a community need.

In two of our established programs--that's our A.D. programs--there were advisory committees that studied the need for the program and whether or not there would be community support. One program was initiated by the administrator at the hospital in a particular town because they have difficulty in recruiting R.N.'s. They knew they should not go ahead with plans to re-open their closed diploma program but they were interested in being a clinical facility for an A.D. program. So that advisory committee met for about a three-year period before the program was actually initiated. The advisory committee was most helpful in interpreting the A.D. program in that community and how its graduates would meet a community need.

The committee was composed of civic leaders. There were people from the men's and women's service clubs--a newspaperman was extremely helpful. In fact, he was one of the guiding lights in helping the college secure their budget. There were representatives from possible clinical facilities in the area, registered nurses from the district nurses association, general educators, and representatives of the State Board of Nursing.

This committee was not only helpful in interpreting the program to the community but they also secured scholarships from some of the banks of this town which was tangible evidence of support of the program.

In another instance where we had a hospital school of nursing we had meetings --not an advisory committee but a committee made up of almost the same kind of representatives--for almost a five-year period. The community was not ready for an A.D. program. The college was in the throes of becoming a four-year college and retaining their two-year program. They were not in a state of readiness to assume a nursing program nor did they have the financing. A study was made of that area and the nursing resource study that I mentioned that is now three or four years old was used, the number of high school graduates was studied, what the potentials would be and it was decided that because of the number of high school graduates and cultural factors in this particular community--there were many Spanish-Americans and many of the girls marry young and do not seek further education--the conclusion was reached that this community could not support two nursing programs. They would have had a little diploma program and a little A.D. program and we felt this should not happen. The diploma school made the decision. They phased out their program as the A.D. program was initiated. The director of the diploma program explained it to the community through the Chamber of Commerce.

Most of our junior colleges in the state are dependent on state appropriation so it has been necessary that legislators understand the need for these new programs; be willing to support them and that the college would be able to obtain a sufficient budget.

Another thing the Board does is consider the type of programs to be established and its relationship to the controlling body. It determines if the policies of the program in nursing are in accord with the general policies that

govern the organization and administration of other units in the college that offer programs of comparable types and academic level. We have been very firm about this. We do not want the A.D. program to be treated any differently administratively or as far as personnel policies concerned. We want the A.D. program to be an integral part of the college.

At the time we survey, we are interested in knowing whether or not nursing faculty will be representatives on other college committees and other agencies of the faculty.

Financial resources are investigated and a determination is made if there will be a budget for the nursing program. If a class is accepted in this program, the college has an obligation to assure the Board there will be adequate budget to see this class through to completion.

Our regulations of a nursing program require that the director of a nursing program shall have a masters degree. Our law provides, if a school is not meeting the regulations of the criteria set forth, they are notified in writing how they are not meeting the criteria and they are allowed one year to meet the requirements.

Faculty qualifications are reviewed by the Board. A report is submitted to the Board each time a new faculty member is employed in the nursing program.

While we are not involved with salaries as a Board, I still talk about salaries. In some areas where they say they cannot recruit faculty, I'm not so sure faculty is not available and with what they are offering in the way of salaries they are never going to recruit qualified people. We try to point out the facts of life.

The application form also asks for the philosophy, purposes and accreditation of the controlling agencies. We are interested in the philosophy of the college itself. We know at this point they will not have a philosophy for the nursing program because they do not have a director yet. We are interested in the quality of the college.

After the application is completed it is reviewed by the Board. The Board will then direct a survey of the agency or college to amplify and verify the information submitted in the application. Additional information will be obtained during the survey regarding 1) the adequacy of clinical and physical facilities, 2) the availability of courses required in the professional and general education content of the curriculum--can this college offer the courses the nursing program will require or are they going to set up something special for nurses that we frown upon and do not approve of.

We make a written report of our findings that is submitted both to the Board and the agency.

Clinical facilities in the hospital and other sources for possible student experience are visited.

One of our greatest problems is a lack of psychiatric facilities. Except in a [illegible]w instances, our general hospitals do not have a psychiatric unit or provide these services. One of our programs has a summer session and the students are sent to Fort Logan.

In clinical facilities, we feel there should be a sufficient number of patients so the faculty may be selective in choosing experiences that will fulfill the objectives of the program.

The hospitals used must be accredited by the appropriate accrediting bodies. We are using nursery schools, public schools, we have used doctor's offices and we are using nursing homes. In one area we have a home for mentally retarded children.

The quality of nursing care in a hospital facility is appraised and considered. We visit with the director of nursing service in whatever facility is to be used and discuss their philosophy of nursing service, their inservice education program and all the other facets that go into making up a desirable nursing program. We are interested in staffing. If they have practical nurses as team leaders, we do not care to have students in that situation.

While the law does not say we accredit a nursing service, I do not think students should practice in an area that is not giving quality care.

We are interested in their attitudes. We will have a conference with the hospital administrators; if we can meet any of the Board of Directors, we are interested in knowing them; we are interested in knowing the attitude of the supervisor and staff nurses regarding an A.D. program. Will these people be accepted in the hospital or will they be made to feel like third-rate citizens? We want to know that the administration supports this kind of education and will continue to do so.

We want to know that the student is there for an educational experience and not to give nursing service.

All the things that might become problems later through misunderstanding are discussed at the beginning.

At later visits we will be interested in what contracts or agreements have been written setting forth responsibility of both the clinical facility and the college, and we are also interested if there will be adequate office space or conference rooms for faculty at the hospital and the college. We are interested in how much clerical assistance faculty members will have. We do talk about some of the physical facilities of the college and what they can offer.

Following this initial survey, the Board will advise the agency of the decisions concerning the initiation of the program and offer continued consultations. If approved at this point, then the college should employ a director of the program one year prior to admission of students. We feel faculty should be employed a few months prior to initiation of the program.

The regulations read that the responsibility of the director should be the drafting of a tentative curriculum plan; organizational charts should be available showing agency control, relationship, and lines of authority. The regulations further read, the director shall submit to the Board written evidence of the readiness of the program to admit students. The law now says the school shall show evidence that they can carry out their objectives.

An interim accreditation will be given at this time if the report of the program is favorable. Provision should then be made for student recruitment. If the college itself has a recruitment program, the nursing program should be part of that.

The responsibility of the director and faculty shall include development and implementation of a statement of philosophy and purposes, the curriculum and its objectives and plans for student welfare. We are also interested in the development of evaluation tools.

A progress report shall be made by the director as requested by the Board.

The college presidents will be invited to the open meetings of the regulations, they will be sent a copy of the regulations, we have a newsletter that we send to them. Even though they do not have a nursing program, we keep them informed of Board activities. When the time comes when they decide to have a nursing program, we are not strangers to each other.

The Board will make periodic visits to the school and make written reports of these visits. These reports will be made available to the directors of programs for additions and corrections.

Consultation by the Board is always available. One kind of consultation we offer is to keep them informed of the steps they must take so that they will reach the stage of interim accreditation and have the assurance their students can write the state board examination. We have had outside consultants come into the state and help.

Finally, a survey to actually accredit the program shall be made by the Board six months prior to the graduation of the first class. Our law reads that in order to write the licensing examination you have to be graduated from an accredited--not an interim accredited--educational program.

Following our survey report, there is another written report and again this is reviewed.

Large Group Discussion

Question--If the A.D. graduate is not to be a team leader and they cannot employ bachelor degree nurses and they give up their three-year school, who are going to be their team leaders?

M. Dickinson--Miss Montag would you like to comment on that?

M. Montag--I have said on previous days the word "team" has been used without the concept. I think about 99 and 99/100ths per cent of the places using team are not using team at all. If you are going to use the team as I understand the team, then you need somebody whose qualifications are far superior to anything that is in the typical diploma program. In most places, I don't think the team is functioning.

Question--What we are hiring these diploma graduates for is a charge nurse. Now how does the A.D. graduate fit into this role because I think this is what we are having in these hospitals rather than team leaders. We are having charge nurses.

M. Montag--The fallacy is compounded. The three-year diploma graduate is not an administrator, she is not a leader of and able to counsel with respect to improvement of nursing care. This is not what she is prepared for.

Question--Isn't there a danger then that we are going to be more bottom heavy than we have been in the past? It is well to say we should not hire these people in these positions, but really there are many hospitals where baccalaureate graduates just are not available. We should be working hard to get these baccalaureate programs but I don't know how we can get them if we don't have the facilities for them and we don't want poor ones.

M. Dickinson--Are we offering salaries that will attract the best?

Comment--In some of these areas we are paying more than the large cities are.

M. Montag--I think that something else that has to be done with this is to look at the way nursing service is organized. They are operating under policies, procedures, and activities and actions that are maybe 100 years behind the times.

M. Dickinson--Perhaps you would be interested in knowing what we do after a school has full accreditation. Are they always having to run to the board.

Accredited programs permit an annual written report to the board. Schools may be surveyed annually but, in actual practice, if a program has been without problems and the graduates do well in state board examinations, and, if on our last visit, the school was progressing, they have a prepared faculty, they are doing self-evaluation, we do not make a full survey every year. There is no fixed time for an annual visit.

Regulations require that all major curriculum revisions shall be reported to the Board before implementation.

The regulations for the Colorado schools of nursing were written by a committee known as the Educational Standards Committee made up of representatives from each school. These regulations that will govern the schools actually are the work of the schools themselves.

We are very fortunate in that we have a national test pool examination. Some years ago all the boards agreed to join the test pool so that people in all states would be writing the same licensing examination. Through our large committees on state boards of nursing, we have been able to agree on the same passing score, except for a couple of states. This makes it easier for people to move from one state to another. Everyone is writing the same examination across the country.

Question--Is there a possibility of combining the Board and League accreditation visits?

M. Dickinson--I think the Board might but I don't think the League would.

M. Montag--The accreditation for schools of nursing by the predecessor of the National League began about 1937. In the 1950's after the Nursing Schools of the Mid-Century Evaluation there began what was called a school improvement program, financed by Commonwealth Funds to the tune of several hundred thousand dollars. We set out then to improve schools of nursing. This temporary and full accreditation plan went into effect.

The junior colleges by and large have not been subject to specialized accreditation. They have had regional accreditation which accredited the whole program. One doesn't need to review but just to mention this whole problem of the multiple agencies and for which the national accrediting commission came into being.

The Junior College Association has been opposed to anything but accreditation by the regional association.

The Pasadena Junior College applied for accreditation by the League partly to help with the law change and to help with their evaluation. Henry Ford Community College in Dearborn, Michigan requested it because they were having a little trouble with the board and regulations and if they could get League accreditation it would prove they were all right and the state would relax a bit.

The State of California and the State of Florida both adopted a policy that a nurse member of the accreditation team would be added for any institution in which there was a nursing program. And that, therefore, the nursing program would be given the same scrutiny as any other program. The partial reason for that was that when accrediting teams have gone into a college they have usually ignored the nursing program.

Then along comes the Nurse Practice Act which includes for the first time the associate degree and baccalaureate degree programs, and the statement was that the school should be approved or accredited and the question by whom. Of course the League has been designated as the official approved body by the National Accrediting Commission so that was no question.

The National Accrediting Commission has never approved the League as the official accrediting body for the A.D. programs although they have been requested to do so on many occasions. This may have changed since March. After many appeals and bitter meetings last summer, the commissioner of education ruled that the League was the agency.

Junior college people have resented having to belong to an agency to get Federal money. It is explained that you don't have to belong but there are pressures which are brought to bear which are subtle which almost cause agency membership to be required.

The new department which has just been developed and the new steering committee which was just elected and has gone into action within the past six months declare that the accrediting procedures under the new department are going to be vastly different and they are not going to be as onerous or as difficult.

M. Dickinson--There is nothing written in the law that says a state board will accredit a nursing service.

Mr. Ause--I think one of the great weaknesses of the joint commission on accreditation is its failure to give any great recognition to nursing service. The changes that have occurred in the field of nursing education have not been solely within the field of nursing education but have been the result of social, economic, cultural and financial phases of our entire community.

M. Montag--It has always seemed strange to me that nursing is the only group that has been so affected. Doctor and lawyers aren't prepared that way. And they have come out of the same social scheme and depression. At the risk of seeming dogmatic, I think we have to have convictions. We are not going to change overnight, obviously. We certainly are going to have to say, this is the way we want to move and then move in that direction.

Question--Madolin, I want to know or have some discussion on this--the possibility of separate examinations for a technical nurse and the professional nurse.

M. Dickinson--This has been mentioned--I wouldn't say discussed--at our State Board conference groups. Our laws say that you issue one license for minimum safety to practice. Unless the laws are changed you couldn't have two types of license examinations because you would have to have two kinds of licenses.

M. Montag--Would it not be conceivable to think of the academy division of A.N.A. as representing a level beyond the minimum level to practice? This, to me, seems to be a way out of this dilemma and some sort of distinction between the technician and the professional.

Mildred Montag
July 29, 1966

Summary

Miss Schmidt's study to which I made reference the other day, comes out with several recommendations number one of which is, that the State Board has a real obligation to identify colleges within the State that might be suitable and to perhaps be the initiator in the development of a program in that college. And by the same token, it seems to me, they should identify the colleges in this kind of study that are not likely places. Certainly, I think we ought to take the position that not every college, four-year or two-year, should have a nursing program. At this particular moment, I don't believe we need one additional baccalaureate program in the United States. We aren't using the ones we've got and I think we ought to fill those up before we begin to dilute further the personnel and the financing to establish new programs.

I think this is not true, in some states at least, with respect to the associate degree program. There could and should be more, the number of which will depend upon the state population, the availability of facilities and the like. But the identification of colleges that can and should develop programs--I think it is the joint responsibility of the board and another arm, if you will, of the nursing organization, either the American Nurses Association or some combination with the National League for Nursing--in other words joint planning.

It seems unfortunate to me that the reports come and they come out of Miss Schmidt's study but came earlier, that when the college people sought help it wasn't available. They sought it from local leagues, state leagues or from districts or state associations and they report it is not available. In Miss Schmidt's study the most help came from the hospital group, not just the nursing department but the hospital administrator, etc. I think this is a rather sad commentary on the official organization or the league which is not a professional organization but which is a nursing interest organization.

Somehow, these groups ought to be the ones from which help could come. So I think there needs to be some statewide planning as to where, when and how. I think Florida represents the best example of this because the Kellogg project stemmed there out of the state board of nursing. They were able to identify and time the beginning of programs so that they covered the state geographically but also in consecutive order so that they didn't have them all trying to develop at once. They would spot a place and then they would begin to work in that area and develop that. When that was on the way, they would start in another area so that they were strategically placed over the state.

It seems to me too that we need to plan on several fronts. It isn't the question that we shall get rid of all diploma schools, we shall have all associate degree programs, we shall have none of any--what. But if we are going to accept, and it has been officially accepted, but if we are going to accept in a more than official way the Position Paper, then we must make plans to phase out the L.P.N. programs and the diploma programs. But simultaneously we need to move into and enlarge, if that is the case, or enlarge the associate degree and the baccalaureate. Because if we are going to move toward the two levels of nursing then we have to do it simultaneously with the phasing out of the other two. So often we get rather panic stricken and we say, we can't close all of the formal programs tonight. Nobody in the world is suggesting this. But we must act. It is my belief that if we don't do it, somebody else is going to. I think we must

be masters of our own destiny. This is one of the marks of a professional group.

This question of faculty preparation--this must grow apace. We can't very well talk about enlarging programs or developing new ones or improving those we have unless we have faculty preparation--and the master's candidate and to say nothing of those beyond are not in sufficient supply to even replace those who leave these positions.

The question about timing--it seems to me the only time to begin is right now. We had a report in 1923--the Goldmark report--we had the Grading Committee report in the '30's. There is an interesting chapter in that report--too many yet too few--which points up some of the inadequacies of the people we were producing.

In 1950 when I made my study, there were practical nursing programs that exceeded diploma programs, and there were diploma programs that exceeded in quality the baccalaureate program.

In 1948 we had the Brown report and that laid it on the line pretty specifically. You may remember her rather drastic terminology--socially undesirable schools and distinguished schools. She made recommendations about accreditation. One was that it be without cost--without cost to the schools. That there ought to be some other way to finance this. This may be something that the profession is going to have to face.

The Surgeon General's consultant group recommended another study. I heard recently there had been some consultation with some leaders with representatives of foundations and there was some optimism there might be some money forthcoming for yet another study. We have had the long term goals committee of the American Nurses Association which enumerated and enunciated three goals. One had to do with nursing service and I think it is significant that the one on nursing service preceded the one on education. The third one was, that within 25 to 30 years the professional nurse would be that one with a baccalaureate degree.

Since we have the kind of government we have and since we have the kind of responsibility within the state education departments or state boards of nursing or whatever, this whole area of education is a state responsibility. Therefore it behooves us on the state level to begin to organize and to implement this program. The time is now.

In summary, we've attempted to do a kind of explanation and interpretation job of what is the associate degree program. How it's developed so we might have some perspective. We've attempted to show some of the steps that might be taken in the development of a program and it has been made quite specific this morning what a college in a state should do if it wishes to develop a program. We have attempted to show some of the general considerations; show what some of the problems are; what some of the issues might be; we attempted to not gloss over some of the problems and to say there is an easy road to an associate degree program. Again, I wish in 1952 we'd had the Position Paper.

MISS MONTAG THEN GAVE A FAREWELL TO THE PARTICIPANTS

UNIVERSITY OF COLORADO SCHOOL OF NURSING

Bureau of Nursing Research and Studies

August 18, 1966

KROPP-VERNER WORKSHOP OPINIONNAIRE REPORT

Title of Workshop: Associate Degree Program in Nursing

Date Held: July 25-29, 1966

Place Held: University of Colorado, College Inn, Boulder, Colorado

Conference Coordinator: Mrs. Elda Popiel

Sponsored by: The University of Colorado School of Nursing and the W. K. Kellogg Foundation

Workshop Score*: 3.076

Highest Individual Average Score: 5.390

Lowest Individual Average Score: 1.130

Range of checks: 1 - 7

Number of papers: 31

---

*The scores for workshops and for individuals may range from 1.13 to 10.89, or approximately 1 to 11, a range of ten points. Low scores indicate more satisfaction with the workshop on the part of the participants.

SLC/md

# ASSOCIATE DEGREE PROGRAM - 1966

## Summary of Responses

1. (a) What additional information about the conference in advance would have been helpful?

Received word from Donnelly -- Did not receive direct word -- Not your fault.

Did not know about the $5 charge. By and large -- yes.

Could have helped if information was available in early spring.

The information was slow in coming.

Would have appreciated knowing earlier whether or not application was accepted.

Earlier notice of workshop. Program came soon enough.

I received information late. Many places near my location did not receive any type of information.

Notification of acceptance came rather late. Not enough information given about housing at College Inn (re: telephone service, etc.)

Did not know until late date that I was attending so had no time to read and prepare for the workshop.

2. (b) If you checked "needs improvement" for any of the above please note below the improvements that would have made you more comfortable.

Lighting at times was inadequate (when drapes were closed). Sometimes a tad chilly with air-conditioning or too stuffy when turned off.

Need clean bathroom linen each day.

Should be notified that there are no nearby stores, e.g., drugstore for necessary purchases. Need for car in order to take advantage of community.

Relaying of messages could be improved.

Telephone in room.

(a) Better P.A. system
(b) No extra supply of toilet tissue -- had to ask for it.

Public address system was poor.

Drapes especially needed service in most rooms that I visited.

Audio system was not good. Meals in cafeteria were ample but food was not especially tasty.

2. Continued

Bedrooms should be checked daily for basic room supplies, that is towels, paper, or cleaning.

Taxi service is very poor -- such long waits. Could you put a fire-cracker under its service?

Lighting in meeting room could have been better. Couldn't see the chalk board very well. Loud speaker could have been more effective, possibly, if the speaker's table would have been elevated. There were no hangers available in room.

Meeting room somewhat crowded. More information and help on touring the area (beautiful mountain scenery).

Lighting and public address system.

Room for small group meetings was uncomfortably warm.

3. (c) What would have most improved this conference? (Other than facilities, services and meals mentioned on preceding page).

An excellent conference.

I have been satisfied with the presentation. I feel I received what I came for.

Not so many small group sessions where there is so much heterogeneity.

Better small group leadership.

This has been excellent.

Do not have any recommendations to make.

Truthfully, I can find none.

Small group sessions only first 2 days.

Perhaps an audio-visual or loud speaker operator to keep these running properly and without taking the coordinator's time for mechanical problems.

Fewer small group discussions.

More time.

Considering the purpose of and objectives of this conference, I feel it has fulfilled its purpose.

Did not know until late date that I was attending so had no time to read and prepare for the workshop.

4. (d) If another conference in this same subject area is held, what should be included? (Be specific)

A conference for teachers in the program and for hospital nursing service representatives would be good, I should think.

4. Continued

Course sequence, content, objectives, learning experiences.

Accreditation of program. Course content.

"Accreditation of the A.D. Program". Also we will need a workshop to which we could send some of our faculty on curriculums for A.D. programs!

A workshop for teachers in an A.D. program would be most helpful.

Teaching - Goals, means of attaining goals, evaluation with emphasis on teaching methods.

Curriculum design -- faculty in-service.

Teaching methods, role play pre and post conferences, also role play multiple assignments. Workshop to include teaching methods.

Curriculum - nursing content.

1. Information for nursing service personnel, i.e., in-service education programs and how they can assist in continued growth of A.D.
2. Conference (brief) for college adm. officers, geared to help them understand and better communicate the sale of nursing faculty - ex., laboratory hours, mandatory license, state board policies, etc.
3. A workshop on identified learning experiences, preparation of causes, preparation of course outline (for A.D. program faculty). Perhaps in two one-week sessions.

A.D. "brush-up" for qualified instructors for the purpose of reconverting thinking and up-dating A.D. nursing instruction. A.D. curriculum development.

A conference for instructors would be helpful -- curriculum and teaching methods.

Curriculum content.

Same content should not be repeated. Perhaps some type of advanced content material. Members of the conference might relate their own experiences in organizing and/or administering an A.D. program.

More curriculum content break-down. More methods of handling clinical facilities.

Curriculum development.

Probably something for faculty of A.D. programs (of which I am not new).

A representative from an operating program to explain the day to day operation would have been helpful to educators.

Greater detail in regard to curriculum, teaching methods, and what constitutes adequate clinical experience. Review of newest developments in A.D. programs.

4. Continued

Most participants were open minded and anxious to learn. It would be a shame for anyone to go away and not have an appreciation of the A.D. program.

Please send more information to Junior Colleges and Hospital personnel. The PI this time failed to reach many of those who wished to attend.

There were too many small group conferences. If we could have had a report of the discussion of the other groups we would have gained more. The group to which I was assigned was subjective and argued a great deal.

Very valuable. Miss Montag gave direct answers to questions, even while admitting not everyone was in agreement with her. If I asked a question, I want the "expert's" view even though I reserve the democratic right to differ.

Very well organized, planned and carried out. Speakers were outstanding.

Well planned. Mrs. Popiel made us feel much at home with her graciousness. Efficient too.

Dr. Montag's presentation and discussion was the most useful to me. The content least useful were small group conferences, but I believe they served a purpose. The institute was excellent, practical, and useful to me. Please have another conference with Dr. Montag as resource person next summer geared for the nursing faculty.

It has been very helpful. It was quite interesting to meet with college educators and to hear their views on nursing education.

Good conference. I hope you have a follow-up for instructors. I would appreciate some examples of curriculum content organization.

I would like to compliment the University of Colorado Nursing Faculty for the service they rendered to us from other areas. I feel deep gratitude to the resource people, especially Dr. Montag, for giving of their time. I wonder if they realize the great service they've extended to all of us.

Miss Mildred Montag, as speaker, was excellent. Entire workshop was of considerable value to me and my institution.

I enjoyed the week very much. The friendly atmosphere was quite conducive to putting all at ease. I would like to return next year.

UNIVERSITY OF COLORADO SCHOOL OF NURSING

Summary

Evaluation - Conference on Assoc. Degree Program
July 25-29, 1966

| | | |
|---|---|---|
| I. | Content area most useful | |
| | 1. Everything Miss Montag offered was vital | 16 |
| | 2. Preplanning and organizing for starting program | 7 |
| | 3. Curriculum | 8 |
| | 4. Admin. and responsibilities of Jr. Community Colleges | 6 |
| | 5. Student selection | 5 |
| | 6. General philosophy of Community Colleges | 4 |
| | 7. Material on faculty requirements | 3 |
| | 8. Resource persons | 6 |
| II. | Content area least useful | |
| | 1. Small group session not always beneficial | 8 |
| | 2. Historical development of Hosp. and Med. | 4 |
| | 3. Viewpoint of Hosp. Admin. | 9 |
| III. | Comments on reaction to Conference | |
| | 1. Questions and answers in group sessions helpful-more objection sharing | 3 |
| | 2. Good Conference - well-planned and organized | 27 |
| | 3. Administrator's views minimal in value | 7 |
| | 4. Purpose of workshop highly satisfactory | 3 |
| | 5. Very helpful and assuring to those starting program | 6 |
| | 6. Leaders of Conference very helpful | 5 |
| | 7. Stimulated interest | 5 |
| | 8. Good cross section of A.D. - Gen. Nurs. Educ. participants gave different viewpoints | 4 |
| | 9. Started on time and session ended on time designated | 5 |
| IV. | Suggestions | |
| | 1. Follow-up Conference next summer | 6 |
| | 2. Material on preparation for faculty in A.D. programs | 4 |
| | 3. Have curriculum development work session for A.D. programs | 13 |
| | 4. Have conference on accreditation of A.D. programs | 4 |
| | 5. Include methods of teaching for Instructors | 8 |
| | 6. Include clerical facilities | 3 |
| | 7. Policies and arrangements for clinical facilities | 3 |
| | 8. Fewer small group sessions | 4 |

Dental Laboratory Technician's Training Program; Plans and Policies (Proposed).

Industrial Educational Center, Durham, N.C.
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 29p.

*HEALTH OCCUPATIONS EDUCATION; PROGRAM PROPOSALS; *DENTAL TECHNICIANS; ACCREDITATION (INSTITUTIONS); CURRICULUM; PROGRAM DEVELOPMENT; TECHNICAL EDUCATION; *EDUCATIONAL PROGRAMS; PROGRAM ADMINISTRATION; *PROGRAM CONTENT; *PROGRAM GUIDES; CERTIFICATION; EMPLOYMENT QUALIFICATIONS
NORTH CAROLINA

The proposed program consists of a 2-year curriculum to train generalists and a curriculum of an additional year to train technicians in one of the following specialities: full denture, partial denture, ceramics, and crown and bridge. In addition to meeting the requirements of the North Carolina State Department of Public Instruction, the Durham City Schools, and the Industrial Education Center, the program is consistent with the requirements of State and national professional dental associations. Students are male high school graduates meeting general center admission requirements. Specific aptitude tests might be required. Teaching personnel for the basic program includes four dental laboratory technicians and a dentist as a part-time supervising consultant. Other dentists are employed to lecture in a limited assigned phase of their special subject area, and commercial dental laboratory representatives give lectures or demonstrations. Components of the basic curriculum are technical mathematics and physics, chemistry, dental anatomy and physiology, dental materials, metallurgy, English composition and speech, orientation and ethics, jurisprudence and professional relations, and laboratory courses in full dentures, gold castings, inlays and crowns, crown and bridgework, partial dentures, and ceramics. Dental Laboratory Technician's Training Program
Plans and Policies (Proposed)

Purpose and Objective of Program. The purpose of the program is to provide a means for the training of qualified individuals, who plan to pursue a career as a dental laboratory technician in a dental laboratory, and, thereby, provide an essential auxiliary service to the profession of dentistry. It is through the medium of the dental profession, that the qualified dental laboratory technician will provide a significant and a greater health service to the people of the State of North Carolina.

The primary objective in this program is to train technicians at the vocational (non-degree) level in the category of the generalist as defined by the Council on Dental Education, American Dental Association (See Exhibit I), November, 1957.

The secondary objective of this program is to provide training for the other four categories as listed and defined by the Council on Dental Education (See Exhibit I), as follows: dental laboratory technician in (1) full denture, (2) partial denture, (3) ceramics and (4) crown and bridge.

General Requirements: Standards and Length (time) of Program. The plan and policies of the entire program and curriculum will be consistent with:

A. The requirements for the approval of educational programs for dental laboratory technicians, Council on Dental Education, American Dental Association, as approved by the House of Delegates of the American Dental Association in November, 1957 (See Exhibit I).

B. Rules and regulations established by the Certification Board for Dental Laboratory Technicians, an agency of the National Association of Dental Laboratories. (See Exhibit II).

C. The policies and requirements of the North Carolina State Department of Public Instruction, the Durham City Schools, and the Industrial Educational Center at Durham, North Carolina.

D. The policies and regulations of the North Carolina Dental Society, the North Carolina Dental Laboratory Association, and the laws governing the practice of dentistry as they may pertain to the State of North Carolina.

U.S. DEPARTMENT OF HEALTH, EDUCATION & WELFARE
OFFICE OF EDUCATION

THIS DOCUMENT HAS BEEN REPRODUCED EXACTLY AS RECEIVED FROM THE PERSON OR ORGANIZATION ORIGINATING IT. POINTS OF VIEW OR OPINIONS STATED DO NOT NECESSARILY REPRESENT OFFICIAL OFFICE OF EDUCATION POSITION OR POLICY.

Specific Requirements and Policies: Standards and Length (time of Program).

A. Length of Course.

1. The curriculum, for its completion in the category of the generalist, will require two full academic years of nine months each.

2. The curriculum for the other four categories (full denture, partial denture, ceramics, or crown and bridge), when offered, will require an additional full academic year beyond that of the generalist.

B. Admission.

1. Male students, who are graduates of a recognized high school or its equivalent, and who are residents of North Carolina, are eligible for enrollment in the curriculum, consistent with the admission requirements of the Industrial Educational Center at Durham, North Carolina. New admissions will be limited to 20 students for each class.

2. Specific aptitude tests may be required in addition to the general admission requirements.

3. Admission would be granted only at the beginning of the academic year in September.

C. Cost of Course.

1. There will be no tuition costs. However, the student will be required to pay for the instruments, textbooks, supplies, and incidental expenses.

2. The costs cited in "C1" above do not reflect the overhead costs in the use of laboratory equipment, teaching personnel, or other routine operational procedures.

D. Curriculum Design and Residency Requirement.

1. First Year. The subject areas as defined by the Council on Dental Education will be pursued in residency at the Industrial Education Center in Durham, North Carolina. See Exhibit III for course content of the curriculum.

2. Second Year. The didactic and laboratory experience in the second year curriculum will be accomplished in residency at the Durham Industrial Educational Center, with intermittent field trips to one or more commercial dental laboratories and to the student patient clinics at the University of North Carolina in Chapel Hill, North Carolina.

a. Practical Experience.

(1) Initially, the students will be provided with duplicate casts or dies from mouths or teeth of patients treated in the clinics of the University of North Carolina, involving partial and full dentures, crown and bridge, inlay, and ceramic restorations. These duplicate casts, dies, or impressions will represent cases comparable to that received in the average commercial laboratory, and it will permit the processing of the full or partial dentures, crown and bridge casting, ceramic, or inlay restorations.

(2) Following the experience cited in (1) above, duplicate or original impressions, casts, or dies will be given the (technician) student, wherein the end product (denture, bridge abutment, bridge pontic, gold inlay, ceramic restoration) will be used by the patient. The dental laboratory technician (student) will also be given the opportunity of observing the dental student in the University Dental clinic insert the denture, bridge, or inlay. See Exhibit III for course content of the second year.

(3) Consistent with item D2a(2) above, the dental student (UNC) will write the appropriate prescription for denture design and construction, to be given to the (technician) student, and, thereby, provide a teaching and experience pattern which is fundamental to acceptable dentist-technician liaison.

E. Promotion and Graduation.

1. Promotion. Following the satisfactory completion of the first year curriculum, the student is eligible for promotion to the second year curriculum, and he

will receive a document from the Director of the Industrial Educational Center attesting to the fact that the first year program has been completed.

2. Graduation. A document will be presented each student by the Director of the Industrial Educational Center, following the satisfactory completion of the second year (category-generalist). When any of the other four categories (full denture, partial denture, ceramics, or crown and bridge) are completed satisfactorily, in accordance with the full requirements prescribed for that category, an additional document will be presented to the student.

Teaching Personnel (Full-time) and Consultants (Part-time).

A. Teaching Personnel (Full-time)

1. The full-time teaching staff will consist of four dental laboratory technicians (for full two-year curriculum), and other full-time personnel associated with the Durham Industrial Educational Center.

a. Educational, Experimental, and Other Requirements of Dental Laboratory Technician Teacher.

(1) The technician to be eligible for teaching must be certified in one or more areas by the National Board for Certification of the National Association of Dental Laboratories, or be eligible for Certification in one or more areas. A waiver of the "Board Certification Requirements" may be granted for one calendar year for a technician who is eligible for Certification. See Exhibit II for Certification requirements.

(2) Responsibilities and Duties of Teacher Technicians. One of the teacher technicians, to be known as the supervising technician, will be given the responsibility for routine operations and supervision of the program, i.e., schedules (other technicians, students, consultants), attendance, supplies and equipment, in addition to regular teaching assignments. The job descriptions of the teaching technicians are identified and listed in Exhibit IV.

B. Consultants, Part-Time.

1. Supervising Consultant. A dentist, who has been, or now is, identified with the teaching of prosthodontics and dental materials, will be designated the supervising consultant. His services would be required about one-tenth time (half day per week), with the following duties and responsibilities.

   a. Curriculum and course evaluation from the dental profession's point of view.

   b. Liaison between Durham Industrial Educational Center, Dental Profession, Laboratory Association, School of Dentistry at UNC, and Council on Dental Education.

2. Other Professional Consultants.

   a. Dentists, preferably those now identified in a teaching capacity in a special area (prosthetics, crown and bridge, ceramics, ethics, legal considerations, taxes, etc.) would be employed to lecture in a limited, assigned phase of their interested subject area.

   b. Commerical dental laboratory owners and representatives from recognized commercial firms would be invited to give lectures or demonstrations.

Exhibit I

AMERICAN DENTAL ASSOCIATION
Council on Dental Education

# REQUIREMENTS FOR THE APPROVAL OF EDUCATIONAL PROGRAMS FOR DENTAL LABORATORY TECHNICIANS*

Purpose of Requirements: The purpose of these Requirements is to provide an outline of an educational program which it is believed will be effective in providing the training and experience needed by a dental laboratory technician. The character and the quantity of the training and experience has been planned with full realization that the dental laboratory technician is adjunctive to the dental profession and that the function and the responsibilities of the dental laboratory technician are defined through the statutes of the individual states.

These educational standards have been developed by the Council on Dental Education so that they might be used as a guide by schools and by dental laboratories in planning courses of instruction. These standards can also be used by the dental profession and by the dental laboratory owner in reviewing the specific functions that may be expected of a dental laboratory technician. In creating these standards, the Council on Dental Education, through conferences with members of the dental profession and representatives of the National Association of Dental Laboratories, came to the conclusion that these educational standards should recognize five different kinds of training and experience, each representing a different dental laboratory position. These five categories of training are:

1. Generalist in dental laboratory technology.
2. Dental laboratory technician in full denture.
3. Dental laboratory technician in partial denture.
4. Dental laboratory technician in ceramics.
5. Dental laboratory technician in crown and bridge.

Authorization of Responsibility: The Constitution and Bylaws of the American Dental Association (Chapter IX, Section 100C) state: "The Council on Dental Education shall act as the agency of this Association in the investigation of dental education and associated subjects. It shall make recommendations for means and methods for the improvement of such subjects to the Board of Trustees for action in conformity with policies adopted by the House of Delegates. The Council on Dental Education shall have authority on behalf of this Association to accredit dental schools and schools in related fields of dental education, to approve internships, residencies and dental specialty boards, in accordance with requirements and standards approved by the House of Delegates."

---

* Approved by the House of Delegates, American Dental Association, at the Miami Beach annual session, November, 1957.

The aims and purposes of the Council on Dental Education were announced in 1939 as follows:

a. To correlate in accord with the evolution of scientific knowledge, clinical experience, and social and economic conditions, the procedures of dental education with the problems involved in meeting oral health needs, and to interpret the relations of dental education to the dental profession and to the public.

b. To organize and administer criteria for accreditation of institutions for the study of dentistry in the United States.

c. To list recurrently for publication the acceptable programs of dental education, in a manner to give the dental profession and the public authoritative information.

d. To facilitate effective coordination of the efforts of dental schools, dental state boards and dental societies toward maintenance of adequate standards of professional proficiency.

e. To promote more complete understanding--in universities, in medical schools and by the public--of the current needs of progressive dental education and dental research in the public interest, and to stimulate the continual development of dental education.

f. To inform the dental profession regarding the nature and scope of the current problems of dental education, and of the conditions and procedures for their solution.

g. To foster constant improvement in the methods of teaching in dental schools, and to encourage the establishment of conditions that would attract an increasing number of men of outstanding ability to the career of dental teaching.

h. To study the educational needs of the practitioner and to recommend ways and means by which he may be provided with opportunities for organized study to maintain proficiency.

For over ten years, the Council on Dental Education has been concerned with the establishment of educational standards for the education and training of dental laboratory technicians. The House of Delegates of the American Dental Association approved the Requirements for a program (Trans. 1948:249) recommended by the Council on Dental Education. It is of course important that the establishment of educational standards for the dental laboratory technician continue to be its responsibility. Also it is important

that the schools and dental laboratories that train dental laboratory technicians should come under the purview of the Association's accrediting agency, namely the Council.

The Educational Program: Whether the educational program is for the generalist or the dental laboratory technician in ceramics, etc., the program consists of two phases, namely:

1. The formal or didactic type of instruction which provides instruction in the basic principles and philosophies associated with the responsibilities of all dental laboratory technicians.

2. The practical or experience phase of the program which provides

   a. for the generalist, a somewhat limited experience in all phases of the dental laboratory

   b. for the ceramist technician, et. al., a comprehensive opportunity for education and experience in the areas in which he chooses to work.

The formal or didactic phase of the programs will be accredited if it meets the requirements of the Council or Dental Education which, in turn, have been approved by the American Dental Association. The Requirements for this portion of the program are described in a later section.

The practical or experience phase of the program will also have certain requirements. Programs which are found to meet these requirements will be recognized by the Council.

## The Formal Program

This didactic program is essential for all who seek to complete either the program for the generalist or the program for the dental laboratory technician in a particular area.

Length of Program: This program must be at least one academic year in length, i.e., approximately nine months.

Institution: The program of basic instruction may be placed under the organization and administration of a dental school, may be operated by a dental school as a separate division under separate administration, or may be conducted as an integral part of a separate educational agency. In each instance the program must be operated on a non-profit basis.

Physical Facilities: The physical plant and facilities will be judged and evaluated upon their adequacy to provide the physical space, the equipment and the environment for the effective conduct of the entire program and for the effective conduct of the courses which are a part of the program; and to provide adequate space for offices and for research of faculty members.

Faculty: The faculty will be judged and evaluated on its adequacy to provide the courses coming under the jurisdiction of each; upon the number of faculty that is available for the lecturing and laboratory supervision; upon the organization of the faculty so as to provide a unified program with specific objectives and aims that are fully recognized and understood by all; and upon the recognition of this faculty as a faculty unit by the parent institution or department.

Admission of Students: All students admitted to this program must show evidence of having secured a high school diploma or its equivalent.

Promotion and Graduation: The students who complete satisfactorily this one-year program may be given a document attesting that the student has completed the course of study satisfactorily or with honors. This may be granted directly by the administrators of the program or by the institution which sponsors the program. It is necessary that the document not indicate that this is a "certificate" or that the individual becomes "certified", for this nomenclature is reserved for those who can evidence certain competencies which require considerably more instruction and experience than is possible in this one-year program.

Library: It is expected that students enrolled in the program will have available for their use a library which will contain textbooks, reference materials and other instructional aids that will augment the teaching. These library facilities should also include materials useful to the teaching staff and to those engaged in research.

Financial Support: The financial management and support of the program will be evaluated in terms of the program meeting acceptable educational objectives. The adequacy of the budget will be reflected in the physical facilities, the equipment, the faculty, the library, the teaching methods and the curriculum. Only through adequate financial support and through properly allocated expenditures can the educational program meet the educational standards included in these Requirements.

As indicated in an earlier section of these Requirements, the institution and the program must not be operated on a proprietary basis.

While it is feasible, through high tuition fees and other remunerative projects, to develop a program that might be self-supporting or even profit-making, these Requirements make it mandatory that the program be conducted for the benefit of the students and to meet the aims and objectives of the profession and the craft.

The financial support of the program will be evaluated to determine whether the parent institution and the administrators of the program have so planned the establishment and the operation of the program so as to guarantee the continuance of its operation for a reasonable length of time.

Curriculum: The course of study should be of one academic year in duration, i.e., about nine months. These Requirements do not specify the number of clock hours or the number of credits for each course. It is expected that the institution will plan a curriculum that will be properly balanced to meet the aims and objectives of the program of study. Also, these Requirements do not specify the names of the courses, but rather stipulate the areas of instruction that must be included in the curriculum.

The following areas of instruction, concepts or topics must be included in the curriculum:

1. Principles of ethics as they apply to the dental profession and the auxiliary dental personnel.

2. Principles of jurisprudence as they apply to the dental profession and the auxiliary dental personnel.

3. History of the dental profession and of the auxiliary dental groups.

4. Relations of the dental profession to the agencies of the auxiliary dental personnel.

5. Function of the National Association of Dental Laboratories.

6. Function of the American Dental Association.

7. Role of the dental laboratory technician and the dental laboratory as a part of the dental health team.

8. Basic principles of English composition and speech.

9. Basic principles of elementary mathematics including concepts of English and metric systems of measurements.

10. Basic principles of elementary physics including physical properties of materials and principles of matter.

11. Basic principles of elementary chemistry.

12. Effects of heat and pressure on various substances.

13. Effects of composition of mixtures on their physical and chemical properties.

14. Uses of various mixtures and compounds in the field of dentistry.

15. Application of spectrum analysis on composition of materials.

16. Preparation and use of porcelains.

17. Application of colors, blending and shading of materials.

18. Knowledge of the principles of administration as they apply to the operation of a dental laboratory.

19. Installation, maintenance and repair of equipment used in dental laboratories.

20. Use and application of equipment and machines used in dental laboratories.

21. Knowledge of tooth form and its application to the fabrication of restorative appliances.

22. Knowledge of plastics and their application to the fabrication of restorative appliances.

23. Ability to interpret and to follow the directives included in a dentist's work authorization.

24. Knowledge of articulation and its application in using an articulator in the fabrication of restorative appliances.

25. Knowledge of casting methods and their application.

26. Knowledge of soldering methods and their application.

27. Knowledge of investing materials and their application.

28. Knowledge of polishing and finishing technics.

29. Knowledge of nomenclature related to the fabrication of dental appliances and to the operation of a dental laboratory.

Instruction: The adequacy of the instruction will be evaluated by giving attention to the adequacy of the instructional staff, the content and the organization of the curriculum, and the use of sound and progressive methods of instruction. The instruction must be designed to meet the specific objectives of the program, i.e., so that the student may acquire, during the period of the program, those skills and abilities which have been announced as the program's educational objectives.

No specific level of instruction such as "college level", "vocational level" or "secondary school level" is specified but instead, the level of the instruction in the various courses must be designed to meet the objectives of the program. It is expected that such an instructional program will contain some concepts that are commonly taught in high school, some that are taught in vocational courses and some that may be included in college courses. Inasmuch as this is not a degree program, it is essentially at the vocational level regardless of the institution in which it may be conducted.

The adequacy of the instruction will be measured, in part by the availability of teaching aids, the use of lecture-demonstration methods, the individual laboratory methods, the student-to-teacher ratios and upon the instructors' abilities to provide the students with the knowledge, principles, and the ability to apply these principles which are included in the aims and objectives of the program.

The instruction will also be evaluated upon the general impressions and concepts given to the students by the faculty relating to the field of dental health and the role of the various members of the dental health team in meeting the aims of the profession and the craft. While special attention will be given to the outcomes of such courses as those in ethics, jurisprudence and professional relations, attention will also be given to the over-all impressions left on the student body by the faculty as a whole.

Relations with Dental Laboratories: For much the same reason that the dental students are required, during their professional education, to become familiar with hospitals and with hospital procedures, so it is necessary that the students in a dental laboratory technician program become familiar with dental laboratories and with their procedures as well as with the laboratories in dental offices. While it is expected that the program itself will provide didactic instruction in laboratory procedures and will perhaps have much the same equipment found in most modern dental laboratories, still it is desirable that all students be given some instruction within a dental laboratory and have occasion to visit some dental laboratory facilities in a dental office.

General Policy of Accreditation: It shall be the policy of the Council on Dental Education to evaluate for purposes of accreditation, the programs for the training of dental laboratory technicians, providing that the administrators responsible for the program indicate their desire for evaluation. Each institution coming under the purview of such evaluation shall be expected to provide the Council with periodic reports and the Council shall expect to send visiting committees to the institution whenever it deems it necessary or desirable. The Council shall provide a listing of accredited programs indicating each as either "fully approved" or "provisionally approved". Those programs which are unable to meet the Requirements will not appear on the accreditation list of the Council. Programs will not be evaluated with a view to their eligibility for accreditation until they are in operation, i.e., no program that exists only as a plan or a proposal will be eligible for accreditation. The Council will assist the administrators in planning new programs and with this knowledge, the Council can provide the administrators with some informal indication as to the likelihood of the program being accredited when it begins operation.

## The Experience Program

Those who seek to complete either the program for the generalist or for one of the specific areas must complete the Formal Program (or didactic portion) of one year and also the Experience Program. The Formal Program has been described in a previous section of these Requirements and the Experience Program is described in this section. The Formal Program normally will be conducted in an institution and the Experience Program normally will be conducted in a dental laboratory.

Length of Program: This program must be the equivalent of 12 months in length and would usually be conducted as an on-the-job program with the individual being employed part time in the laboratory and with the remaining time being spent as a student.

Educational Agency: This program may be conducted in a recognized educational institution or in a dental laboratory. Because of the nature of the instruction and the amount of experience that is to be gained through this program, it is likely that most of these programs will be conducted either wholly, or in part, in a dental laboratory. The program itself must be conducted on a non-profit basis even though it may be sponsored or conducted by an agency that is conducted for profit.

It is possible that many of the Experience Programs will be sponsored jointly by an educational institution and a dental laboratory cooperating in such a way that the physical facilities and instructional staffs of both are utilized.

Physical Facilities: The physical plant and facilities will be judged and evaluated upon their adequacy to provide the physical space, the equipment and the environment for the effective conduct of whatever courses are a part of the program; and to provide adequate space for the offices and for research that may be conducted by the instructional staff.

Instructional Staff: The instructional staff, or faculty, will be judged on its adequacy to provide the courses coming under the jurisdiction of each; upon the number of staff members available for the lectures and laboratory supervision; and upon the organization of the staff so as to provide a unified program with specific aims and objectives which are fully recognized and understood by all. The adequacy of the staff will also be judged on the competence of each, the ability to use sound educational methods of instruction, the ability to use sound educational methods for measuring student achievement and for evaluating one's own teaching effectiveness. The adequacy of the instructional staff will also be evaluated on its understanding of the purposes of the entire educational program of which they are a part and upon their ability to explain and justify the curriculum that they offer.

Admission of Students: All students admitted to this Experience Program must show evidence of having completed satisfactorily the Formal Program or its equivalent.

Promotion and Graduation: The students who complete satisfactorily this 12-month program may be given a document attesting to the fact that the student has completed the course of study and the experience required in the Experience Program satisfactorily or with honors. This may be granted directly by the administrators of the program, by the institution affilated with the program or by the dental laboratory sponsoring the program. It is necessary that the document not indicate that this is a "certificate" or that the individual becomes "certified" for this nomenclature is reserved for those who can show evidence of certain competencies through a comprehensive examination program conducted on a national level. While the completion of the Formal Program and the Experience Program should provide the student with those abilities and competencies needed to acquire "certification", this label of competency is reserved for those who can successfully pass the battery of certification examinations.

Library: It is expected that the students enrolled in the program will have available for their use a library containing textbooks, reference materials and other instructional aids that will augment the teaching. These library facilities should also include materials useful to the teaching staff and to those engaged in research.

Financial Support: The financial management and support of the program will be evaluated in terms of the program meeting the educational objectives. The adequacy of the budget will be reflected in the physical facilities, equipment, staff personnel, library, teaching methods, teaching aids and in the curriculum. Only through adequate financial support and through properly allocated expenditures can the educational program meet the educational standards included in these Requirements.

As indicated in an earlier section of these Requirements, the institution or agency sponsoring this Experience Program must operate it as a non-profit enterprise. While it is feasible, through high tuition fees and other remunerative projects and charges made for the student-produced laboratory products, to develop a program that might be self-supporting or even profit-making, these Requirements make it mandatory that the program be conducted for the benefit of the students and to meet the aims and objectives of the profession and of the craft.

The financial support of the program will be evaluated to determine whether the administrators or sponsors of it have so planned its establishment and operation as to guarantee the continuance of its operation for a reasonable length of time. In this way, the administration shall guarantee to the students, the staff and the profession and the craft that this program will continue to produce graduates over a reasonable length of time.

Curriculum: The curriculum of the Experience Program follows and expands upon the Formal Program for the dental laboratory technician. While the Formal Program is fairly standardized for all dental laboratory technicians, there are several kinds of Experience Programs. It is in this Experience Program that there is differentiation between the programs for the following:

1. Generalist (general laboratory technician).

2. Dental laboratory technicians in any of the following areas are currently recognized:

   a. full denture fabrication;
   b. partial denture fabrication;
   c. ceramic technic;
   d. crown and bridge technic;
   e. other (to be announced later)

The curriculum for the generalist as well as for each of the specialist areas must be the equivalent of 12 months in length.

The program for the generalist must include experience in all of the operations of the laboratory, including the following areas:

1. Full denture fabrication.
2. Partial denture fabrication.
3. Ceramic technic.
4. Crown and bridge technic.

The experience in each of these areas should be complete in depth and thoroughness as to the variety of methods and the number of applications. The experience in each of these areas for the generalist cannot be of sufficient length during the 12 months to make the individual highly skilled in any one of the areas of specialization. In addition to obtaining experience in all of these areas of specialization, the generalist program should include considerable attention to the administrative and organizational methods of a laboratory and the responsibilities associated with supervision. The specific listing of skills and abilities and the suggestions for the level of competence which should be obtained by the generalist for these areas, are not included in the Requirements. Instead, they will be available in another document. These suggestions and recommendations will be adjusted periodically as a result of the findings of the Council reported by the instructional staff and the sponsors of the programs.

The curriculum for each of the Experience Programs designed for the individual highly skilled in laboratory technics in either full denture fabrication, partial denture fabrication, ceramic or crown and bridge technics, etc., follows a pattern quite different from that of the program designed for the generalist. For example, the Experience Program for the individual highly skilled in full denture fabrication must be of 12 months' duration, or its equivalent, and should supplement the basic knowledge and principles provided in the one-year Formal Program by providing the student with extensive learning and experience in one area of operation (in this illustration, the area of full denture fabrication). This curriculum will provide additional lectures and demonstrations in such concepts and topics as the following:

1. Knowledge of tooth form and its application to the fabrication of restorative appliances.

2. Knowledge of the chemical and physical properties of plastics, as they relate to the fabrication of full dentures.

3. Knowledge of and ability to follow work authorizations from dentists, as they relate to the fabrication of full dentures.

4. Knowledge of polishing and finishing technics and an attainment of skill in executing these procedures.

5. Knowledge of the nomenclature related to all of the procedures and all of the work authorizations concerning the processing of full dentures.

6. Knowledge of the chrome alloy methods of fabrication and an attainment of a high level of skill in using at least one such method in the fabrication of full dentures.

7. Knowledge of the principles involved in the mounting of models on articulators by different types of transfer and an attainment of a high level of skill in these operations.

8. Knowledge of other basic principles and facts related to the fabrication of full dentures and a knowledge of their application in the dental laboratory.

In addition to the above representative partial listing of the types of information that must be included in the Experience Program, a part of which must be included through the medium of lectures and demonstrations, the student must be given extensive experience in all important facets of full denture fabrication. This must be given through adequate supervision to guarantee it as a teaching program. While the listing here cannot be all-inclusive and while much of this experience will be planned by the administrators and instructional staff of the program, the following items are areas of experience in which each student will be expected to gain a high level of competence:

1. In the pouring of impressions, model making and trimming.

2. In the routine arrangement of teeth on an articulator.

3. In waxing and contouring.

4. In the laboratory procedures necessary for the repair, duplication and relining of full dentures.

5. In the color selection, staining, and the individualizing of artificial teeth.

6. In checking and evaluating the physical aspects of the completed denture fabrication.

7. In those additional areas of operation needed by the laboratory technician in full denture fabrication.

The above reference to the type of content expected in the curriculum for the Experience Program in full denture fabrication is representative of the type of content that will be expected in the other special areas, such as partial denture fabrication, ceramic and crown and bridge technics. Specific recommendations and suggestions for the content of these areas, as well as supplementary listings for the full denture fabrication curriculum, will be available through other publications as indicated earlier.

Instruction: The adequacy of the instruction will be evaluated by giving attention to the adequacy of the instructional staff, the content and organization of the curriculum and the use of sound, progressive methods of instruction. The instruction and the experience must be designed to meet the specific objectives of the program, i.e., so that the student may acquire, during the 12 months or its equivalent, those skills and abilities which have been announced as the program's educational objectives.

The adequacy of the instruction will be measured in part by the adequacy of the instructional staff to provide proper supervision and the preparation of the staff to provide other instructional information. The instruction will also be measured by the availability of teaching aids and by the soundness of the program for evaluating the achievement of the students.

The instruction will also be evaluated upon the general impressions and concepts given to the students by the instructional staff relating to the field of dental health and the role of the various members of the dental health team in meeting the aims of the profession and the craft. While special attention was given in previous programs, and will be given in this one, to the aims of such courses as those in ethics, jurisprudence and professional relations, attention will be given to the over-all impressions left on the student body by the instructional staff as a whole.

General Policy of Accreditation: It shall be the policy of the Council on Dental Education to evaluate, for purposes of educational accreditation, the programs for the training of dental laboratory technicians providing that the administrators or sponsors responsible for the program indicate their desire to have the program included in the Council's programs of evaluation. Each program coming under the purview of this evaluation shall be expected to provide the Council with periodic reports and the Council shall expect to send visiting committees to the program whenever it deems it necessary or desirable. The Council shall provide a listing of accredited programs, indicated either as "fully approved" or "provisionally approved". Those programs which are unable to meet the Requirements will not appear on the accreditation listing of the Council. Programs

will not be evaluated with a view to their eligibility for accreditation until they are in operation, i.e., no program that exists only as a plan or a proposal will be accredited. The Council will assist the administrators in planning new programs and with this knowledge of plans for the new program, the Council can provide the administrators with some informal indication as to the likelihood of the program being accredited when it gets into operation in accordance with its proposed plan of operation.

Exhibit II

REQUIREMENTS FOR CANDIDATES FOR CERTIFICATION

1. Must conform to the following definition of a dental laboratory technician:

   "A dental laboratory technician is an individual trained or educated to perform one or more phases of the dental laboratory procedures required in the creation of dental appliances under the dental prescription or authorization."

   NOTE: An individual may apply for certification in any of the following areas:

   a. Generalist in dental laboratory technology. (The all-around, supervisory or administrative technician)

   b. Dental laboratory technician in full denture. (The technician with special qualifications in full dentures)

   c. Dental laboratory technician in partial denture. (The technician whose special qualifications are in partial dentures)

   d. Dental laboratory technician in crown and bridge. (The technician whose special qualifications are in crown and bridge technics)

   e. Dental laboratory technician in ceramics. (The technician whose skills are devoted to the technics of porcelain and its related technics)

2. Submit an application and a fee of $15.00 to the Board.

3. Submit evidence of satisfactory moral and ethical standing in the dental laboratory craft.

4. Be a citizen of the United States or Canada or have filed a declaration of intention for United States citizenship.

   Until December 31, 1963, applicants for certification will be qualified by satisfactorily meeting the following basic requirements:

(c) Anatomically reproduce tooth form in wax, as required for crowns, pontics, and inlays,

(d) Use vacuum investment technique (Hollenbach),

(e) Use electric furnaces and casting equipment for gold crowns and inlays,

(f) Prepare and bake porcelain tips for bridge pontic. (This technique necessitates use of porcelain furnace

(g) Knowledge and ability in blending acrylic and porcelain shades.

(h) Knowledge and use of acrylic and porcelain for facing and crowns.

(i) Assemble, solder, and polish a bridge.

d. <u>Ceramics</u>.

(1) While the knowledge and ability to develop a porcelain jacket crown or a porcelain inlay in the laboratory are highly desirable, and priority in selection should be given to the teacher (technician) with these qualifications, such technicians are in short supply.

(c) Anatomically reproduce tooth form in wax, as required for crowns, pontics, and inlays,

(d) Use vacuum investment technique (Hollenbach),

(e) Use electric furnaces and casting equipment for gold crowns and inlays,

(f) Prepare and bake porcelain tips for bridge pontic. (This technique necessitates use of porcelain furnace)

(g) Knowledge and ability in blending acrylic and porcelain shades.

(h) Knowledge and use of acrylic and porcelain for facings and crowns.

(i) Assemble, solder, and polish a bridge.

d. Ceramics.

(1) While the knowledge and ability to develop a porcelain jacket crown or a porcelain inlay in the laboratory are highly desirable, and priority in selection should be given to the teacher (technician) with these qualifications, such technicians are in short supply.

Exhibit III

## Dental Laboratory Technology Curriculum

The course constitutes two nine months terms. Classes average seven hours per day for five days a week or thirty-five hours per week. The nine months terms are divided into three twelve week quarters with an additional examination week per quarter or thirty-nine weeks per year.

### First Year

| First Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| Technical Mathematics I | 5 | |
| Technical Physics I | 4 | 2 |
| Chemistry I | 4 | 2 |
| Dental Anatomy and Physiology | 2 | 8 |
| Dental Materials | 2 | 6 |
| | 17 | 18 |
| | | 35 hours |

**Technical Mathematics I** — 5 hours lecture

A review of the basic arithmetical operations that are functional in nature including concepts of English and Metric systems of measurements plus an introduction to simple formulas and algebraic procedures.

**Technical Physics I** — 4 hrs. lecture,2 hrs.lab

A practical introduction to physics including the structure of matter; properties of solids, liquids and gases; force and motion; work, energy and power; analysis of basic machines; friction; and spectrum analysis.

**Chemistry I** — 4 lecture, 2 hrs. lab

Fundamental principles of general chemistry including the common elements, equations, types of chemical reactions, ionization, and oxidation and reduction. Additional study includes compositions of plating solutions and the fundamental principles of electro-plating, as well as a short study of chemical metallurgy.

Dental Anatomy and Physiology 2 hrs. lecture, 8 hrs. lab

An introduction to anatomy of the head and neck, histology, physiology and occlusion with special emphasis on the anatomy of the individual teeth and surrounding tissues plus practical tooth anatomy for function in carving wax patterns.

The laboratory portion includes drawings of each tooth from central incisor through the second molar on one side for the maxillary and mandibular arches. Three teeth are carved completely, including the coronal and root portions -- maxillary central incisor, maxillary first bicuspid, and maxillary first molar. All teeth on one side of a stone dentoform (maxillary and mandibular) are removed one by one and replaced with wax carvings to occlusal function.

Dental Materials 2 hrs. lecture, 6 hrs. lab

A comprehensive study of dental materials such as gypsum products, impression materials, resins, waxes, investments and duplicating materials.

The laboratory exercises are designed to illustrate the physical properties of all materials studied, plus the results of proper and improper manipulation of the materials.

First Year

| Second Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| Metallurgy | 5 | 3 |
| Laboratory Techniques I (Full Dentures) | 2 | 15 |
| Laboratory Techniques II (Gold castings-inlays and crowns) | 1 | 9 |
| | 8 | 27 |
| | | 35 hours |

Metallurgy 5 hrs. lecture, 3 hrs. lab

A study of ferrous and non-ferrous metals and their application to dental procedures including physical properties of metals and alloys, crystalline structure, theory of alloys, soldering, casting, heat treatment, fatigue, and principles of polishing.

The laboratory exercises are designed to illustrate the physical properties of the alloys used in dental procedures and the results of proper and improper manipulation.

Laboratory Techniques I — 2 hrs. lecture, 15 hrs. lab

Three set-ups of full upper and lower dentures including balancing of occlusion plus curing, finishing, polishing and correcting of occlusion of one full upper and lower. Fabrication of custom trays and bite blocks is also included, along with denture repairs. Different type teeth are used on each case along with a different dentue base material.

Laboratory Techniques II — 1 hr. lecture, 9 hrs. lab

Models are prepared from hydrocolloid and rubber impressions and dies are prepared from tube impressions. Wax-ups, investing, carving and polishing of simple and complex inlays, full crowns, 3/4 crowns, and faced crowns is accomplished along with the soldering of contacts and the soldering of castings together. A total of no less than twenty castings are fabricated.

## First Year

| Third Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| English Composition and Speech | 5 | |
| Laboratory Techniques III (Crown and Bridgework) | 2 | 12 |
| Laboratory Techniques IV (Partial Dentures) | 2 | 14 |
| | 9 | 26 |
| | | 35 hours |

English Composition and Speech — 5 hrs. lecture

A study of the fundamentals of writing and speech, including a study of words, sentence structure, punctuation, paragraph composition, speech construction, vocabulary enunciation and diction. Unity, conciseness, coherence and clarity are stressed in the writing of business letters.

Laboratory Techniques III — 2 hrs. lecture, 12 hrs. lab

Construction of bridges of various designs utilizing metal and porcelain facings. This is to include all procedures from the fabrication of the model through the polishing of the completed bridges. Lower posterior three unit bridge, upper posterior four unit bridge, anterior three unit bridge and anterior six unit bridge are constructed.

Laboratory Techniques IV — 2 hrs. lecture, 14 hrs. lab

Survey and partial design for upper and lower cases of various complexities utilizing several tilts is accomplished on duplicated practical cases. One upper and two lower partial frameworks are constructed of gold alloy and chrom-cobalt alloy.

## Second Year

| First Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| Laboratory Techniques V (Crown and Bridgework) | 1 | 15 |
| Laboratory Techniques VI | 1 | 18 |
| | 2 | 33 |
| | | 35 hours |

Laboratory Techniques V — 1 hr. lecture, 15 hrs. lab

Included in this course is the construction of bridges utilizing pin facings with baked porcelain tip pontic construction in the anterior and posterior regions. This is to include waxing retainers, baking tips, waxing pontics, casting, soldering and polishing. One six tooth maxillary anterior bridge and one five tooth maxillary posterior bridge are fabricated.

Laboratory Techniques VI — 1 hr. lecture, 18 hrs. lab

Study and application of techniques concerning immediate dentures, full upper and lower rebases and relines; plus the construction of a full upper using cast palate and acrylic teeth set against a lower natural dentition.

| Second Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| Orientation and Ethics | 1 | |
| Laboratory Techniques VII (Crown and Bridgework) | 1 | 15 |
| Laboratory Techniques VIII (Partial Dentures) | 1 | 17 |
| | 3 | 32 |
| | | 35 hours |

Orientation and Ethics — 1 hr. lecture

A short history of the dental profession and of the dental laboratory technician is included along with the legal aspects of dental practice and the code of ethics for dental technicians.

Laboratory Techniques VII — 1 hr. lecture, 15 hrs. lab

Bridges using a combination of methyl methacrylate and gold construction for retainers and pontics are fabricated. This is to include all framework waxing, soldering if necessary, polishing, waxing of labial surfaces, flasking, baking, curing and polishing. A six tooth maxillary anterior bridge and a six tooth mandibular anterior bridge are constructed.

Laboratory Techniques VIII — 1 hr. lecture, 17 hrs. lab

A continuation of laboratory techniques IV using cast frameworks to set up and finish partial dentures. Included in this course is the rebase of partial dentures, construction of wrought partial frameworks and the fabrication of a unilateral tooth borne appliance. Also included is the construction of a precision attachment case with tube or slot pontics in conjunction with laboratory techniques VII, plus further surveying, designing and waxing of practical partial cases.

| Third Quarter | Lecture Hours | Laboratory Hours |
|---|---|---|
| Jurisprudence and Professional Relations | 1 | |
| Laboratory Techniques IX (Ceramics) | 1 | 15 |
| Technical Review | | 18 |
| | 2 | 33 |
| | | 35 hours |

Jurisprudence and Professional Relations — 1 hr. lecture

This course is to include the scope of the dental laboratory technician, organizations of the dental laboratories and the status of the dental laboratory technician in relationship to the dentist and the dental profession. Also included is material on managing a commercial laboratory.

**Laboratory Techniques IX** 1 hr. lecture, 15 hrs. lab

A study of composition and physical properties as well as the fundamentals of manipulation of the materials precludes the laboratory sessions. Fabrication of dies for complete crowns and inlays and adaptation of platinum matrix plus complete manipulation of porcelain crowns and inlays including firing, grinding, glazing, etc., is included in the laboratory portion of the course. Twelve porcelain jackets and six porcelain inlays are fabricated.

Technical Review 18 hrs. laboratory

All work accomplished is of a practical nature and is to be utilized by patients. Original impressions are supplied by senior dental students of the School of Dentistry, University of North Carolina, along with a technical prescription from which the technician students fabricate the appliances. Dentist-laboratory relations are followed with the exception that the technician students are allowed to witness the insertion of the appliances they have fabricated.

Exhibit IV

Teacher: Dental Laboratory Technician Job Specifications*

1. High school graduate, preferably one or more years of college.

2. Certification, or eligible for certification, in one or more areas by the Certification Board, National Association of Dental Laboratories.

   a. Technician should be certified, or eligible for certification, as a generalist.

   b. Following certification as cited in "a" above, the technician who was certified, or eligible for certification, in one or more additional areas, would receive priority in appointment as a teacher.

   c. The requirement for certification may be waived for one year in items "a" or "b" above, assuming the technician already is eligible to take the certification examinations.

3. Member, North Carolina Dental Laboratory Association (this requirement may be waived for one year).

4. Technician should possess knowledge and ability in use of the following items:

   a. High Speed Polish Lathe
   b. Dental Laboratory Engine
   c. Air Fired Porcelain Furnace
   d. Vacuum Fired Porcelain Furnace
   e. Vacuum Pump
   f. Porcelain Tip Holder
   g. Chrome-cobalt Casting Machines
   h. Gold Casting Machine
   i. Ticonium Electro Polisher
   j. Ticonium Sand Blaster
   k. Shell Blaster
   l. Automatic Curing Units
   m. Hydraulic Flask Press
   n. Model Trimmer
   o. Partial Denture Design Surveyor
   p. Burn Out Ovens
   q. Electric Plaster Mixer
   r. Polishing Lathe (Gold and Plastic)
   s. Ready Duplicator
   t. Compression and Injection Acrylic Flasks
   u. Ti-lon, Luxine 44, and Jectron
   v. Vacuum Investing Equipment

* The Supervising Technician, in addition to the job specifications or qualifications outlined in 1 through 6d, should have had a broad experience with various commercial dental laboratories and general practitioners of dentistry. Teaching or experience as a clinician or demonstrator on a broad level would be most helpful.

Guidelines for the Training of Nurse Aides. Bulletin 77L-1.

Florida State Dept. of Education, Tallahassee. Technical and Health Occupations Education
MF AVAILABLE IN VT-ERIC SET.
State Department of Education, Room 271, Knott Building, Tallahassee, Florida 32304 (no charge).
Pub Date- Sep67 14p.

*HEALTH OCCUPATIONS EDUCATION; *NURSES AIDES; *PROGRAM GUIDES; CLINICAL EXPERIENCE; CURRICULUM; ADMISSION CRITERIA; TEACHER QUALIFICATIONS; EQUIPMENT
MDTA PROGRAMS; *MANPOWER DEVELOPMENT AND TRAINING ACT PROGRAMS

Developed principally for use in setting up Manpower Development and Training Act programs, the guidelines are also endorsed for use in institutional programs. The nurse aide assists registered nurses who make assignments on the basis of the patient's needs. Trainees should be at least 17 years of age and able to read, write, and speak English at the eighth grade level. Recruitment and preliminary screening are to be handled by the State Employment Service and final screening and acceptance by the school. The teacher-student ratio should be a maximum of one to 13, and teachers should be registered nurses with recent nursing experience, certificated to teach in vocational education. Cooperating agencies should be licensed by the Board of Health, and accredited by the National Association of Accreditation of Nursing Homes, Inc. or by the Joint Commission on Accreditation of Hospitals is recommended. The maximum time allotment should be 180 hours with 80 hours of classroom and 100 hours of clinical learning experiences. Tasks to be taught are in the areas of the patient's immediate environment, personal hygiene, elimination, nutrition, and comfort and safety measures. Also included are a form for notice of course completion, a list of program objectives, a list of topics in question form, which could be used in curriculum design, suggestions regarding teaching methods and materials, suggested teacher and student references, a sample agreement between the school and cooperating agency, and a list of suggested equipment for the course. # GUIDELINES for the training of NURSE AIDES

DIVISION OF VOCATIONAL,
TECHNICAL, AND ADULT EDUCATI

CARL W. PROEHL, Assistant Superintenc

TECHNICAL and HEALTH
OCCUPATIONS EDUCATION

THOMAS W. STRICKLAND, DIRECTOR

# INTRODUCTION

The important contribution of the supportive assistance of the nurse aide in the rendition of service is in the performance of selected tasks. The tasks, listed herein, are taught to prepare the aide to function under the immediate supervision of a registered professional nurse.

Because of the variation in employing agencies in job requirements for the nurse aide, the tasks which are taught in this program are intended to provide basic pre-service preparation only. If additional tasks are required, they should be taught by the employing agencies in in-service education. Employing agencies must recognize their responsibilities for providing in-service education to prepare the worker in terms of their expectations.

This program is based on the belief that the nurse aide should be prepared to perform certain selected tasks and the patients for whom these tasks are performed must be selected as well. The term "selected patient" is intended to mean that the registered professional nurse shall render the judgment necessary to select the patients according to their state of dependency or independency. Hence, the registered nurse will select those patients who are independent of the need for skills rendered by the registered professional nurse, this selection must be performed by the registered professional nurse after a careful evaluation of the patient's needs and the nursing care plans.

# GUIDELINES FOR THE TRAINING OF NURSE AIDES

## GENERAL STATEMENT

The Florida Nurses Association in its effort to contribute to the improvement of the quality of nursing care rendered to the citizens of this state, endorses the following Guidelines for setting up MDTA Nurse Aide Training Programs. The State Department of Education recommends that these guides also be followed in setting up institutional nurse aide training programs.

The effectiveness of the contribution of the nurse aide as a supportive assistant to the registered professional nurse is based upon the requirement that the registered professional nurse make the two following judgments in planning nursing care:

(1) A determination of the state of dependency (or independency) of the patient on skilled nursing care.

(2) An assessment of the ability of the nurse aide to perform the tasks.

A planned nursing care situation implies that the registered professional nurse has made the foregoing judgments and determined if there are tasks that the nurse aide can safely perform.

Because of the variation among employing agencies in job requirements for the nurse aide, the tasks which are taught in those programs are intended to provide basic pre-service preparation only. If additional tasks are required, they should be taught by the employing agencies through in-service education.

Employing agencies should recognize their important responsibility for providing orientation and on-going in-service education to prepare and maintain the worker in terms of the employment situation.

## DETERMINATION OF NEED

Demonstrated need for such workers is determined by the Florida State Employment Service through survey of local health agencies.

## DEFINITION: NURSE'S AIDE

A nurse's aide is a "task-trained" person who has been taught, through a short-term course, to perform tasks which involve personal care services for patients. The nurse's aide is neither a professional nurse nor a licensed practical nurse, nor should her activities be such as to constitute the practice of nursing, as defined in Chapter 464, Florida Statutes, and in the Rules and Regulations of the Florida State Board of Nursing.

The nurse's aide is an auxiliary worker in nursing service who may be employed to assist nurses in hospitals, nursing homes and such other situations where registered professional nurse judgments are made relative to the needs of the patient and prior to the assignment of such tasks.

In certain employment situations the nurse's aide may be designated by such other titles as: ward attendant, orderly, or nursing assistant.

## QUALIFICATIONS OF TRAINEES

1. Ability to read, write, and speak English at the eighth grade level.
2. Age: 17 years minimum.
3. Health Certificate from local Health Department.

## SELECTION AND SCREENING:

1. Recruitment to be handled by local office of the Florida State Employment Service.
2. Screening for educational level by Florida State Employment Service.
3. Screening for aptitude by Florida State Employment Service (minimum score of 75 on general intelligence factor of GATB series used by the Florida State Employment Service.)
4. Evidence of good health.
5. Final screening for acceptance into training by school personnel.

## STANDARDS FOR RETENTION IN COURSE

Students should be informed that failure to perform satisfactorily in either class or clinical area is cause for dismissal; and that the judgment of the school is final.

## CLASS SIZE

Enrollment in the course should be limited to a maximum of thirteen students per teacher to insure effective instruction and supervision in the clinical area. Students are to be placed in only one institution for experience unless there is continuous supervision by an instructor or by a member of the registered nurse staff who is assigned and available to give assistance with this supervision under the direction of the instruction.

## FACILITIES NEEDED

1. Classroom with space for demonstration and laboratory practice, with handwashing facilities.
2. Clinical facility in a hospital and/or nursing home for supervised practice.
3. Clinical facilities should have an adequate number of nursing personnel and provide proper nursing care to patients.
4. Office facility for instructor.

## CRITERIA FOR THE USE OF NURSING HOME AND HOSPITAL FOR EXPERIENCE

1. Licensure by the State Board of Health.
2. Accreditation by the National Association of Accreditation of Nursing Homes, Inc. for Nursing Home experience; or accreditation by the Joint Commission on Accreditation of Hospitals is strongly recommended.
3. Registered nurse on duty in charge of nursing service when students are having clinical experience.
4. Nurses on the staff currently licensed in Florida.
5. Appropriate job descriptions for all nursing personnel.
6. Adequate equipment and facilities available in the clinical facility to meet the objectives of the program.
7. Signed agreement with the participating agency. (See appendix for suggested agreement form.)

## EVALUATION OF PROGRAM AND NEED

The appropriate agency or agencies should conduct regular and periodic assessments of the program as well as determine the need for continuation of the program.

## INSTRUCTOR QUALIFICATIONS

1. Registered nurse, currently licensed in Florida.
2. Recent experience in nursing patients.
3. Experience in a nursing home and/or orientation to the nursing home before teaching the course.
4. Some preparation for teaching is desirable.
5. Valid vocational education teaching certificate.

## STUDENT UNIFORM

Pastel colored smock is to be worn over cotton street clothes during nursing practice (classroom/clinical); it shall bear a "Nurse Aide Trainee" sleeve patch.

NOTICE OF COMPLETION

The school shall provide the aide with a wallet size identification card as follows:

This certifies that _____ has had _____ hours
(Name)
of nurse aide instruction and practice in performing certain selected tasks to assist the nurse in giving patient care.

This (Nurse Aide) course was offered by the _____ County of Public Instruction and approved by the Florida State Department of Education.

Date of Signature _____ _____
(Signature and Title)

No graduation exercise, ensignia, school pin, or cap should be provided.

COURSE DESCRIPTION

I. Time Allotment

A. Total hours 180 (maximum)

1. Classroom (including laboratory practice) 80 hours
2. Clinical learning experience 100 hours

II. Program Objectives

This course of instruction is designed to help the student in the following ways:

A. To know who is the nurse aide.
B. To understand the nature of the nurse aide role and its necessary limitations.
C. To gain beginning manual skills in performing the selected tasks listed in the course content.
D. To gain increasing skill in performing these tasks safely, economically, and effectively
E. To know how to contribute to the comfort of the patient.
F. To understand the legal implications in the performance of nurse aide work.
G. To develop beginning abilities in observing and reporting factors related to the patient and his environment.
H. To experience satisfactions which come with self-improvement.
I. To understand that attitude toward work influences job satisfaction.

## III. Content

The nurse aide is a task-trained worker; the course content is directed toward the learning of certain selected tasks which the aide carries out with selected patients. Because the nurse aide is an assistant to the nurse rather than an assistant nurse, the course should be designed, taught and learned within this frame of reference.

A list of tasks, of and in itself, does not constitute the course curriculum. In fact, it can hold less meaning for the learner if treated as just a list to be learned. To make the course meaningful, the tasks should be organized into a purposeful sequence or pattern. This pattern should be designed according to sound educational concepts if the learner is to gain maximum benefits. Some of these concepts are:

1. Learning is transferable. What is learned in one situation can be transferred to another situation and used to help understand and clarify it.

2. Learning takes place faster when moving from the known to the unknown, from the simple to the more complex in an orderly, logical way.

3. Learning takes place faster if the learner "sees" something familiar in a new experience: Each experience serves as a background for future experiences.

4. Learnings do not occur singly. Knowledge is always accompanied by the learner's frame of mind. Attitudes develop toward what is being learned.

5. When a learner sees his chartered course as geared to his goals and needs, he persevers.

### APPROVED LIST OF TASKS TO BE TAUGHT

A. Patient's Immediate Environment

1. Making an occupied and unoccupied bed.
2. Neatness, order and convenience in patient's unit.
3. Light, ventilation, temperature, and noise control.

B. Personal Hygiene

1. Oral hygiene.
2. Back care.
3. Bath and skin care.

C. Elimination

1. Give and remove bedpan

2. Give and remove a urinal.
3. Assist patient to the toilet.

D. Nutrition

1. Prepare patient for meals.
2. Set up a food tray.
3. Serve and remove food tray.
4. Feeding patients.
5. Pass fresh drinking water.
6. Serve extra nourishment.

E. Comfort and Safety Measures

1. Bed Patient

a. Move and turn patient
b. Position patient for alignment
c. Move patient from stretcher or bed and vice versa
d. Place patient on back rest.

2. Ambulatory Patient

a. Assist patient into a wheelchair or armchair
b. Assist patient to walk with or without devices.

3. Additional Tasks

a. Use a bed cradle for linen support
b. Use foot boards, side rails, gatch and Hi-low beds
c. Use call system
d. Fill hot water bottles and ice caps.

F. Other Tasks

1. Escort and errand services.
2. Taking temperature, pulse and respiration.
3. Weigh patient.
4. Practice good housekeeping habits in maintaining safe, clean overall environment.
5. Keep service rooms in order.
6. Care and storage of linens.
7. Clean and store articles and equipment.
8. Care of flowers.

A SUGGESTED LIST OF TOPICS WHICH MIGHT BE USED IN A CURRICULUM DESIGN

A. Overview of the course.
B. Who is the nurse aide? What role does she play in the care of the sick?
C. What qualities should the nurse aide possess?
D. Who is the patient? What kind of help does he need? How

does his age make a difference in the way he is helped; how does his condition make a difference?

1. Environment
2. Personal Hygiene
3. Elimination
4. Nutrition
5. Comfort and safety
6. Special needs

E. What observations should the nurse aide make? To whom does he report?

F. How can the nurse aide help promote good working relationships with other members of the nursing team?

G. Job satisfaction is important to each person. How can a nurse aide experience job satisfaction?

H. What responsibilities for good hospital housekeeping can the nurse aide carry?

The above topics may be arranged in any suitable order. It should be noted that the entire list of tasks can be divided up under these various topics and be taught accordingly. In this way "the task" related to the patient, and/or to the nursing team and hospital housekeeping. When the topics have been arranged and the tasks placed accordingly, the instructor should allot the amount of time to be used for each topic.

## IV. Teaching Methods and Materials

Of necessity, there will be considerable lecture and discussion. Time should be allowed for questions and answers. Demonstrating will be a much used method; student involvement in practice with close supervision will be another method frequently used. Discussion of problems encountered in the work-practice situation should be another method.

All types of visual aides can be employed; they should be used to help clarity for the student what the teacher has put into words. This student needs simple, uncluttered visual assistance to help him learn faster. Many such visual aides are teacher-made rather than commercial.

The student should be provided with a copy of the topics to be covered, tasks to be included under each topic, and any other such hand-out material as would help him feel acquainted with the course from day to day.

Notebook - each student should have a regular three-ring notebook. All hand-outs should be punched ready for use in the notebook.

Textbook - Students may or may not be required to have individual texts. (a teacher decision).

## SUGGESTED READING MATERIALS

Student

A Manual of Simple Nursing Procedures - Mary J. Leake, 4th Edition. W. B. Saunders Company, Philadelphia, Pennsylvania, 1966, $3.25.

Nurse's Aide Study Manual - Mary C. Abdallak, W. B. Saunders Company Philadelphia, Pennsylvania, 1965, $2.75.

How to be a Nurse Aide in a Nursing Home - Dorothy Erickson Reese, American Nursing Home Association, 1346 Connecticut Avenue, Northwest, Washington, D. C., $2.50.

Teacher (reference)

The Nursing Aide Instructor's Guide - (Public Health Service Publication No. 342) U. S. Government Printing Office, Washington, D. C., $0.25.

Manual of Nursing Measures for Practical Nursing - available from Division of Vocational, Technical, and Adult Education, State Department of Education, Tallahassee, Florida. (Make inquiry as to availability and cost)

NOTE: No single reference listed above can serve as the curriculum. Examine each to determine what, if any, portions can be useful. The tasks list found elsewhere in this publication includes the extent of "procedures" to be included.

SUGGESTED AGREEMENT

FOR

NURSE AIDE TRAINING EXPERIENCES

IN A HOSPITAL OR NURSING HOME

(To be appropriately modified if program is not conducted under provisions of Manpower Development and Training Act)

The _____ Board of Public Instruction of _____, Florida, is conducting a nurse aide training program under the provisions of the Manpower Development and Training Act of _____ weeks in length, for the citizens of _____ county.

The cooperating hospital(s) and/or nursing home agrees to permit the use of their facilities for trainee experience under the supervision of a registered nurse instructor employed to teach the course.

The experience in the hospital and/or nursing home shall consist of approximately _____ hours scheduled during the course by the instructor and in cooperation with the nursing personnel in charge. The instructor shall select assignments in accordance with the functions taught in the course.

The maximum number of trainees in a single class will be 13. The number of classes trained will be determined by the local need.

The undersigned approves the cooperative plan of training as outlined herein for nurse aides between the _____ Board of Public Instruction and the _____, at _____, Florida.

_____
Administrator of Hospital

_____
Date

_____
Director of Vocational Education
Chairman of School Board

## SUGGESTED EQUIPMENT FOR NURSE AIDE TRAINING COURSE

### PATIENT UNIT TO CONSIST OF THE FOLLOWING:

Recommended that one complete unit be set up for every 2-4 students.

Bed with mattress (Hi-Low manual and Fowler Frame)
Bedside stand
Overbed table
Straight chair
Footstool
Bath basin
2 pillows
Emesis basin
Tooth cup
Bed pan
Soap dish
Water pitcher and glass

### DISPOSABLE ITEMS:

Paper bags
Incontinent pads
Paper cups
Toilet tissue
Tissue wipes
Drinking straws
Denture cups
Paper towels
Soap bars
Tongue depressors
Applicators, cotton tipp
Backrub lotion

### LINEN FOR EACH UNIT TO CONSIST OF THE FOLLOWING:

(Order 3 sets of linen per bed that will be routinely sent to be laundered.)

Mattress cover
2 Large sheets
1 Draw sheet
1 Blanket
1 Spread
1 Washcloth
2 Pillowcases
1 Patient gown
1 Bath towel
1 Face towel
1 Bath blanket

### OFFICE FOR INSTRUCTOR:

Desk
Chair
File (2 drawer letter)
2 chairs
Typewriter desk and typewriter
Spirit Duplicator for making copies of hand-out materials

### OTHER LINEN NEEDED:

Hamper bags for linen - 1 bag for each hamper plus 2 extra bags.
Seersucker robes - 1 for each student.
Covers for hot water bottles and ice caps, also bed pans.

### CLASSROOM EQUIPMENT:

Classroom equipped with tablet arm chairs, chalk board, sink with running water, charts and storage cabinets for nursing arts equipment.

Siderails, 2 sets
(1 for Hi-Low and 1 for regular hospital bed)
Rubber ring 1

Tray table, folding for lap 1
Linen hampers 2

Bed cradle, large 1
Urinal 1
Stretcher 1
Wheel chair (1 folding)
Graduated pitcher 1
Bath thermometer 1
Crutches, 1 pair
Shampoo tray
Food tray with dishes and silverware
Commode chair 1

Bed screens 2 or overhead track individual screening
Paper towel dispenser
Waste baskets
Nail scissors 1
Nail clippers 1
Emery Board (1 for each bed)
Hot water bottles 3
Ice caps 3
Ice collar 1
Chase Doll, adult, if desired

The Role of Advisory Committees in Vocational-Technical Education.

Delaware Occupational Research and Coordinating Unit, Dover
MF AVAILABLE IN VT-ERIC SET.
Pub Date - 12p.

*ADVISORY COMMITTEES; *VOCATIONAL EDUCATION; *TECHNICAL EDUCATION; COMMUNITY CONSULTANTS; *PROGRAM DEVELOPMENT

This document is for use by teachers in organizing and utilizing an advisory committee. The role of an advisory committee is defined and four types set forth: (1) general, (2) departmental, (3) craft, and (4) administrative. Guidelines are given on what advisory committees do, how members are selected, and how the commitee operates. (DM)

# THE ROLE OF ADVISORY COMMITTEES IN VOCATIONAL-TECHNICAL EDUCATION

VT005871

Occupational Research Coordinating Unit
State Board for Vocational-Technical Education
Department of Public Instruction
Dover, Delaware 19901

## Preface

It has been truly said and substantiated that the communities which make the most use of Vocational Advisory Committees have the most outstanding programs.

Properly utilized by alert and responsive school officials, the advisory committee can help plan activities which will be of interest and value to the people. Moreover, the advisory committee is the resource group best equipped to keep the local vocational program realistic, alive and ready to adjust to the ever-changing needs of a technologically advanced society.

Wise choice, good planning and progressive follow-up are just as essential in forming an advisory committee as in any other activity. It is hoped that this guide will be an aid in this effort.

F. C. Finsterbach, Ed.D.

# WHAT ARE ADVISORY COMMITTEES

A public school serves the public and, in turn, is supported by it. The school and the community should work together. The school should know what the people want and the people should know what the school is teaching its children.

Advisory committees provide this necessary communicating link. They are made up of representative laymen, recognized and respected experts in their own fields, who help educational authorities build valuable programs based on the real needs of the community.

Vocational education, more than any other type of education, needs close cooperation with the community. It trains workers for specific jobs and productive lives. It needs the periodic help and criticism of the real workaday world to be sure that its training courses are up to date and that its preparation for a lifework is useful. The American Vocational Association believes that advisory committees are an essential part of a truly sound and modern vocational program.

Advisory committees are not new. It has always been necessary for a school administrator to know how many pupils the local industries could absorb and how valuable his leadership has been to his community. Experienced laymen from various occupational fields were willing to become his advisors in improving the various programs of the school.

Industrial education especially has always needed the good public relations a strong advisory committee can create. Labor unions and employers can be either opponents or cooperative allies of a school, depending on the extent to which they have been consulted about training programs. Both groups want to develop better workers, and both groups will support sound efforts to provide good training. An industrial advisory committee is thus especially valuable.

These groups have various names, but titles are not so important as purposes. Whether they are called boards, commissions, councils, or committees is not important; the important thing is that they advise. The word "committee" implies investigation and obligation to the community without the inclusion of legislative or administrative responsibilities. And we must emphasize the fact that these committees are not intended in any way to usurp any of the prerogatives of boards of education or of local administrative staffs. They have no authority to delegate or to legislate.

Sometimes these committees advise on general topics; sometimes they work for a particular field or occupation, or for a special phase of a particular field. Ad hoc or temporary committees, of course, disband when their work for a single specific task is over. Committees of longer standing often begin their work before a vocational education program is established in the community.

## TYPES OF ADVISORY COMMITTEES

### General Advisory Committees

These assist in the development and maintenance of the entire vocational program of a school or a school district. They help to discover the training needs of the service area, to insure a realistic and practical program, to develop community understanding and support for the methods of vocational education, and to build prestige and respect for the school.

General advisory committees are sometimes used together with the departmental or craft committees serving special occupations to coordinate the entire school program.

### Departmental Advisory Committees

Advisory committees also serve a single department in a vocational school or the vocational department of a comprehensive high school, usually in the homemaking, agricultural, and distributive education programs. They judge programs according to local needs; they suggest changes and additions to the curriculum.

### Craft Committees

Industrial education calls the departmental advisory committees "craft committees", but they have many different titles in other fields. They give advice on the content of a single course, coordinating training and development in the various occupations. Fostering good public relations with labor and management groups is one of their important activities. Students, especially those who are already employed, have great respect for shop courses developed with the assistance of an advisory committee from an industry. Labor and management, too, feel more kindly toward a school when course outlines for shop work have been referred to them for suggestions.

### Administrative Advisory Committees

State boards of vocational education may make use of any - or a combination of any - kinds of advisory committees listed above in the development and promotion of state-wide programs. Area vocational schools, covering a large service area, may use representative advisory committees covering a portion or all of their programs. These committees may work under a county superintendent or a group of several superintendents. Advisory committees may also serve at the local level for an entire school district or a single school within a system.

The effective use of advisory committees on the local level, the level where administrators and teachers make direct contact with industry, the public, and students is strongly urged.

## WHAT ADVISORY COMMITTEES DO

First of all, advisory committees should advise the school administration on the types of courses needed to satisfy the day and evening training needs of a community. By evaluating classes in terms of the working world, they help prepare young people to enter their life's work more easily and thoroughly. By suggesting adult classes in vocational schools, they help prepare their fellow citizens to upgrade training for specific occupations open in their own communities.

Advisory committees can help organize community surveys by determining the data to be gathered, by supporting the studies and by helping to evaluate the returns from these studies.

An advisory committee can check vocational training to see that it fits life situations; it can keep public schools from drifting away from reality by assisting in the preparation of courses of study.

General advisory committees for a community wide program or for a vocational department within a school should probably limit their activities to establishing ways for keeping instruction practical and functional. Craft committees for trade and industrial education programs should, however, take an active part in setting up details of courses of study for all shop training, as they have the required specialized knowledge for this work. Representatives of trades to be taught in the vocational program should be consulted on the skills, instructional materials, equipment, standards for production work, and course content. All these phases of training should be reviewed periodically by craft committees in order to keep them functional and up-to-date. The homemaking, agricultural, and distributive education committees must use modifications of the craft committee's procedure to coordinate the work in the school with the demands of the various occupations.

Advisory committees should help to set up standards for entrance into vocational courses. They assist in obtaining jobs for graduates who have successfully completed their training. Their influence is not so much in individual placement as in their effect on the reputation of the school, for employers who know that graduates have been guided by advisory committees are more than usually willing to accept the inexperienced products of this type of school.

A young teacher can be helped by committees; older teachers can be refreshed in outlook and to keep from routine presentation of their subjects. Without a good advisory committee, the teacher often feels isolated, especially when he is the only member of a vocational department; but a committee can give him encouragement and stimulation by sharing his responsibility. The criticisms and praises of an experienced group of practical workers help a teacher to relate his instruction to the particular needs of a community. Teachers can thus increase their self-confidence and grow personally and professionally.

Indirectly, advisory committees have supported school administrations in requests for appropriations. Members have appeared at public hearings to support school budget estimates and have spoken before civic groups in the interests of approved vocational education. They have taken up the task of acquainting the citizens of their communities with the needs of the school, and have thus helped to win justified appropriations.

On a larger plane, advisory committees can influence state and federal legislation on vocational education. When members of manufacturers' associations, service clubs, unions, and other civic groups know the objectives and needs of a school program, they will support school legislation with more understanding and enthusiasm. The organizations to which the members belong can be powerful friends of vocational education. These organizations are listened to by legislators.

An advisory committee can be a good public relations device. It is proof that the public school exists to serve the public and that it uses the help of the public. Community interest and confidence in vocational education are aroused by the various contacts of the advisory committee members. Consequently, the vocational director is repaid many times for the effort involved in organizing such committees.

## SELECTING SUITABLE COMMITTEE MEMBERS

When a school administrator decides to take advantage of the experience of laymen in his community, how does he go about setting up an advisory committee? Unfortunately, there is no specific formula to follow, and this booklet cannot offer guaranteed procedures. However, experience proves some techniques to be good general guides. The administrator can apply certain basic considerations to his selection and appointment of advisory committee members.

An administrator must first receive the approval and support of the local Board of Education in his plan of appointing an advisory committee. School boards, like some administrators, sometimes fear that advisory committees may assume too much authority and perhaps may exercise some of the administrative and legislative powers ordinarily the responsibility of the board. If an advisory committee is to be successful, this suspicion must give way to respect for the experience of the committee and confidence in its judgment and ability to promote the school program. The school needs community members who can contribute to the success of a vocational program. The success of all advisory committees depends largely on their ability and cooperation and on the leadership of the school representative.

### Personal Qualifications

At least three essential points should be kept in mind when one is selecting members of an advisory committee.

Experience Members must have had recent, successful, first-hand, practical experience in the area which the committee is to serve. They should have the respect and confidence of their associates, though they need not necessarily be older people with many years of working experience. A group assisting an agricultural department, for example, should not be composed entirely of retired farmers, or middle-aged, prosperous farmers who have held office many times in different organizations. Younger farm leaders with time and enthusiasm for the work of a school agricultural department and other young men, making the most of limited opportunities and on their way to success, may also be considered for membership. Homemaking departments have found that some recent graduates, familiar with the modern school program, can test its relation to the daily life of the newly-established family. And young industrial executives, who have already made their influence felt in other projects, are an asset on advisory committees.

Available time Members of an advisory committee should keep in close contact with school activities. The amount of time, therefore, that a prospective member can devote to committee work should be considered before he is proposed. An experienced community leader who already holds many offices, for example, may not have enough time, energy, or enthusiasm left to give to advisory committee work. However, such a man is to be preferred to an unknown person, provided he can give the necessary time and leadership.

Patterns for the selection of members of occupational education advisory committees have been established for some time. It has been found that employers and employees should be represented in equal proportion with representatives of the public. Highly-placed industrialists should be selected and craftsmen, respected by their industrial co-workers, should be labor's representatives on a committee. Often the craftsman committee member is the graduate of a local vocational school program, a man familiar with both training methods and industrial requirements.

It is a sound procedure for the representative of the school to appoint the members of the committee after he has consulted recognized leaders in the field to be served. Usually the selecting officer is a superintendent of schools or director of vocational education, but a principal or a teacher may assume or share this responsibility.

When organized groups in the community become members of an advisory committee, they usually select their own representatives, men who will speak for the group.

The size of the program and of the community determines the number of members of an advisory committee. The committee should be representative, including members from important organized and recognized groups in the service area who are concerned with the vocational education program. However, a working advisory committee must not be so large that it cannot readily make decisions or allow informal, constructive discussion.

General advisory committees serving a whole program of vocational education may be somewhat larger than 10 or 15. If a larger committee is appointed, it is often broken up into smaller subcommittees for specific assignments. Craft committees usually operate more efficiently when membership is limited to four or six. Vocational agriculture committees usually require nine or twelve to represent a farming community adequately. Area vocational schools have larger advisory committees than other schools because it is especially necessary for them to have adequate geographical representation from the various sections of their service areas.

Members who are appointed for a definite term of office generally serve for one to three years. Replacements should be staggered, so that there are always some experienced members left on the committee. When a term has expired, the new member should be appointed by, or by the approval of, the school administration. Committees should not become self-perpetuating through the custom of appointing successors for departing members. However, a valuable contributor can be reappointed, and often this is wise.

Sometimes the school administration and the members of an advisory committee may need additional assistance in sloving a particular problem. The use of consultants is recommended in such cases. These experts should be invited to meet with the committee for a limited number of sessions in order to give their opinions or necessary information.

Some of the numerous consultants in different fields who may be called upon are:

Representatives of the U. S. Employment Service, who can furnish labor market data, current training information, and job requirements.

A representative from a craft as consultant to a general advisory committee in planning, conducting, and evaluating a training program.

A management representative as consultant for purchase of equipment for specific training and for information about certain work.

Representatives of local universities and teacher-training institutions to give the latest information on experimentation and research as well as explaining the problems of training qualified teachers.

Members of the State Board for Vocational Education.

Representatives of local, state, national agencies.

No matter how the members are selected, the final authority for approval is always the Board of Education. A formal invitation to membership in an advisory committee must always come from the Board or its designated representative. This is necessary for two reasons: First, this gesture of the Board helps to remove any fears that a committee will usurp its own rights and responsibilities. Final authority is clearly shown in the presentation on the offer on one side and the acceptance on the other. Secondly, appointment by the highest school authority carries prestige to the members of the advisory committee. They realize that they are then responsible to the Board of Education alone and that their recommendations are subject only to the approval of the Board, or its appointed representative.

## HOW AN ADVISORY COMMITTEE OPERATES

It is impossible to formulate a set of regulations for the operation of advisory committees throughout the country. Each State Board for Vocational Education has its own recommendations in keeping with the objectives of its own vocational program, its special problems, and its available personnel. Nevertheless, some generalizations can be made about effective methods of procedure.

Some schoolboards automatically appoint the vocational director as chairman, especially when a general committee is being selected. Our experts suggest, however, that the chairman of an advisory committee be a layman, elected from their ranks by the members of the committee. Some groups prefer a neutral chairman; others alternate the post between representatives of employer and employee groups, if both are represented.

The chief duty of a chairman is to preside at all meetings of the committee. He should work closely with the school administration at all times, and should be consulted when the agenda for a meeting is prepared. He usually appoints subcommittees and represents the advisory committee in other groups. If he is also the school representative, his duties are, of course, much broader.

The representative of the school on an advisory committee is chosen according to the size of the program and the purpose of the committee. A director of the vocational school or a local director of vocational education is the most logical person to assume this role. Another candidate may be the principal of the school in which the vocational program is to be conducted. These men can act directly on the advice of the committee, though they incur the disadvantage of feeling morally bound by the recommendations of the committee, whether they agree or not.

In some large cities or in area vocational schools, the school administrative staff includes directors, supervisors, or coordinators for each field of vocational education, and these men may represent the school at advisory committee meetings. If a committee is created to help only one department, the head of that department should attend its meetings as the sole representative of the school, or as a second delegate in addition to the vocational director. In vocational agriculture programs the instructor often works with the committee. Some schools require that a member of the Board of Education, the local school superintendent, or the school principal be present at all advisory committee meetings. Teachers, too, sometimes attend meetings as seekers of advice, but not as members.

When a vocational director serves on general advisory committees and craft committees for industrial education, an established pattern has been followed in many cases. The coordinator or supervisor of distributive education represents the school for programs of distributive education, and department heads or teachers work with advisory committees in homemaking and agriculture. Variations in the size of the school district and in the extent of a program, of course, will cause variations in this pattern.

The school representative usually serves in three, or in a combination of three, capacities. He may act as secretary for the committee; he may serve as general consultant; he may be chairman. Whatever he does, he must remember that he is only an ex officio member, and seeking counsel.

His routine duties usually are: reading and keeping minutes, notifying members of time and place of meeting, arranging for meeting rooms in the school, providing statistical or descriptive information about the school, preparing reports of progress. (The school should provide all clerical help needed in the work of the committee, including the preparation of minutes, reports, recommendations, and special notices.)

One of the most important duties of the school representative is the preparation of an agenda for every meeting. He is seeking the help of persons experienced in their fields, and it is his responsibility to use their help in the most efficient and orderly way. He must state the exact problems of the vocational program and present them clearly to advisory committees for discussion and advice. He should also consult the chairman and other members of the committee on new, original ideas for improvements and additions and on strengthing the weaknesses of the program.

The school administrator must decide for himself what system is best adapted to his existing lines of communication when he considers the transmission of committee recommendations to the proper school authorities.

It is a common practice to send copies of the minutes and recommendations to the individuals and agencies involved - administrative officers of the school, school board members, and all organizations represented by the committee members. All interested persons are thus informed simultaneously of the work of the advisory committee.

There is no generally accepted policy on the maximum number of meetings to be held every year. Meetings may be called at regular intervals or at times when they seem to be necessary. Many active committees meet whenever they are called, whenever important business must be conducted. Agricultural committees, however, meet monthly except in the summer months.

If a program is to extend over a year or more, regular meetings will be required. Attendance at planned meetings is usually good, and an organized schedule and agenda usually spur the members to meet often and regularly in order to carry out its assignment. Twice or three times a year is not enough, though busy men and women must not, of course, be called together without real justification. Necessity is the criterion for judging the number of meetings.

A formal organization of general advisory committees has advantages. A constitution and by-laws create an atmosphere of permanence and purpose in the group. Members are more willing to participate on a committee with definite duties than in a more informal

organization. A set of rules and responsibilities, approved by the school Board of Education, will clarify the proper position of the advisory committee within the school system.

Too rigid a set of rules, however, will stifle the initiative of the committee members and result in an organization unable to function. A constitution should include only the provisions necessary for efficient committee operation. Advisory committees should be informal and flexible, changing their methods according to circumstances and working in an atmosphere of friendly cooperation.

# INTRODUCTION

The search and abstracting of the literature cited in this document began in October, 1967 and was completed in January, 1968. One hundred sixty-three of the approximately 200 references have been abstracted as indicated. The completion of the abstracting was temporarily suspended due to a shortage of funds, but it is hoped that the abstracts will eventually become available as a companion publication. It was decided that the earlier publication of the title bibliography independent of the abstract bibliography would be beneficial to our readers.

The search of the literature was primarily restricted to references retroactive to 1960 and was obtained by reviewing the following sources:

American Vocational Journal

Education Index

ERIC Clearinghouse on Vocational and Technical Education, Columbus, Ohio

Personnel and Guidance Journal

Poverty and Human Resources Abstracts

Psychological Abstracts

Selected Bibliographies (for example, A bibliography of literature on occupational aspirations and expectations. Department of Agricultural Economics and Sociology, Texas A & M University, College Station, Texas.)

Sociological Abstracts

Vocational Guidance Quarterly

*VOCATIONAL EDUCATION TEACHERS; *TEACHER QUALIFICATIONS; *TEACHER SUPPLY AND DEMAND; *EMPLOYMENT PROJECTIONS; ADMINISTRATOR ATTITUDES; QUESTIONNAIRES; STATE SURVEYS
NEW MEXICO

To determine the projected needs and qualifications for vocational instructors 194 questionnaires were mailed (133 returned) to high school principals, superintendents, directors of vocational programs, and directors of vocational-technical schools in the state. Reported qualifications and needs for vocational instructors are expected to be on the incline in all vocational-technical areas. State administrators estimated expanding numbers of vocational instructors in 1967-68 to 1980 to be: (1) Agriculture, high school present 60, increase to 70, post-high school present 2, increase to 14, (2) Business and Office Education, high school present 104, increase to 292, post-high school present 18, incrase to 47, (3) Distributive education, high school present 24, increase to 71, post-high school present 1, increase to 16, (4) Health Occupations, high school present 15, increase to 46, post-high school present 9, increase to 34, (5) Home Economics, high school present 98, increase to 158, post-high school present none, increase to 20, (6) Technical Education, high school present 15, increase to 79, post-high school present 13, increase to 60, (7) Trade and Industrial Education, high school present 60, increase to 165, post-high school present 17, increase to 67. Samples of the data gathering instruments are included. (MM)

Designing Education for the Future
Study Committee on Instructional Program and Staff Needs

## FORWARD

The purpose of this working paper is to stimulate thought and to provoke ideas concerning the subject under study. In no means does this indicate that all available research on this subject has been covered, nor is this paper to be considered an end in itself. The authors of this series of papers have been given considerable freedom to write in the fields of their expertise and/or their firsthand experience. The views, therefore, contained herein represent the opinions and interpretations of the specific author and are to be used in this light by the committee for Designing Education for the Future, and are not to be considered as opinions taken by anyone working on the project other than the author.

It is the sincere hope of the director that the various study and advisory committee members use these papers as a springboard to formulate the necessary program required by this project; therefore, feel free to add to, delete, or change in any manner your working copy of this paper; for, in the true sense, only then can it become a working paper and thereby fulfill the task for which it was prepared.

Thomas B. Bailey Jr.
New Mexico Project Director

ACKNOWLEDGEMENTS

The author wishes to express appreciation to all who have taken part in the preparation of this study. A special expression of gratitude is due to Dr. Leon A. Wagley, Head of the Department of Agricultural and Extension Education, for his encouragement and assistance in carrying out the study.

Thanks are due Dr. Ramsey M. Groves, Director of Agricultural Institute, for his guidance and advice in conducting the study.

The author is also grateful to Dr. Thomas Bailey, Head of the State Department of Research, Santa Fe, New Mexico, for financing the study.

Appreciation is extended to Mrs. Delores T. Gonzales for the typing of the instrument used in the study.

Special acknowledgement is extended to "Liz," the author's wife, for her help and encouragement during the process of the study.

## VITA

The author was born in Thomasville, Georgia and graduated from Magnolia High School there in 1958. He attended Fort Valley State College at Fort Valley, Georgia. After earning a Bachelor of Science Degree in Agriculture his career included one year with the Peace Corps, one year as science teacher in Fitzgerald, Georgia and three years as vocational agriculture teacher in Camilla, Georgia.

In September, 1967, he was employed by New Mexico State University as Graduate Teaching and Research Assistant in the Department of Agricultural and Extension Education.

The writer is married to the former Elizabeth L. Smith.

## ABSTRACT

### The Purpose of the Study

The purpose of the present study was to determine the projected needs for vocational instructors in vocational and/or technical education at high school and post-high school levels and what qualifications they are likely to need in 1980.

### Method of Investigation

Data was secured by mailed questionnaires from high school principals, superintendents, directors of vocational programs and directors of vocational-technical schools in New Mexico.

### Findings

Projected needs for vocational instructors in 1980. The projected needs for vocational instructors indicated improving existing and formulating new teacher training programs within the state for vocational instructors at high school and post-high school levels.

Administrators believe vocational instructors, by returned questionnaires, are increasing in numbers in vocational service areas. At the high school levels, the projected percentage increase of vocational instructors is 406 per cent and 1106 per cent at post-high school levels by 1980.

According to needs for vocational instructors by respondents, these vocational service areas rank as follows: Business and Office

Education, Trade and Industrial Education, Home Economics, Technical Education, Distributive Education, Vocational Agriculture and Health Occupation Education. At the post-high school levels vocational service areas are ranked according to the following: Trade and Industrial Education, Technical Education, Business and Office Education, Health Occupation Education, Home Economics, Distributive Education and Vocational Agriculture.

Qualifications of vocational instructors at high school and post-high school levels. Projected qualifications show an increase and change in the requirements and certification of instructors in 1980. Service areas with minimum requirements of a bachelor's degree increase to a master's degree with a strong demand of philosophy, history and methods in vocational education.

Areas with requirements less than a B.S. show a strong demand for occupational experiences at high school and post-high school levels.

# CHAPTER I

## INTRODUCTION

Since the signing of the 1963 Vocational Education Act, Vocational Education has changed more than during any previous period. Vocational and Technical Education is America's answer to the cries of business and industry for skilled workers. It qualifies persons for gainful employment in occupations which do not require a baccalureate or higher degree. Vocational and Technical Education conserves and develops our resources; prevents a waste of human labor; increases the wage earning power; and improves productivity of individual workers.[1]

Technical development during the last decade has opened new fields of science and technology which require well-trained personnel. Almost every occupation now requires some degree of organized preparation.[2]

Considerable emphasis has been placed upon upgrading unskilled persons in the work force, however the shortage of qualified instructors has caused these persons to have been somewhat neglected. Probably the most critical problem that faces most states as they attempt

---

[1]Arnold, Walter M., "The Team Approach in Vocational Education," A Design For The Future. Report of a National Seminar on Agricultural Education. Bulletin of the National Center for Advanced Study and Research in Agricultural Education. Columbus: The Ohio State University, 1963. 79 p.

[2]Arnold, op. cit., 80 p.

to fulfill the purposes of the Vocational Educational Act of 1963 is the shortage of qualified teachers. The teacher supply problem was foresseen by leaders of Vocational and Technical Education at the time Public Law 88-210 was signed by the President. Their concern was verified by early reports from around the nation which indicated that there were more teaching positions available than could be filled with the current supply of qualified personnel.[3]

## I. THE PROBLEM

Statement of the problem. The purpose of this study was to determine the projected need for vocational teachers in Vocational and Technical Education at the high school and post-high levels and to determine what qualifications they are likely to need by 1980.

Need for the study. Perhaps the strongest justification for studying needs and qualifications at the present is the shortage of trained vocational teachers. However, the extent of this shortage has not been documented in New Mexico. Projected trends on numbers of teachers needed, including their demands, have been deceptive at the local level. Few studies have shown concern for all the vocational fields. This study will attempt to document the

---

[3]Wagoner, William H., "Staff Development," An Emerging Function For Schools. Department of Rural Education. U. S. Department of Health, Education, and Welfare. Washington. 1964, 4 p.

magnitude of the needs for teachers in the areas of Vocational Education and their qualifications set by 1980.

The findings from this study may have implications for possible establishment of appropriate vocational and/or technical teacher educational programs. It would also provide guidance as to what administrators and vocational leaders believe are the specific skills for special jobs. With many job areas opening in the state data would be classified and results will be available for each vocational service. The information could be used to improve programs already in existence and develop other teacher educational programs as new job areas evolve. Programs as such should be developed on the basis of as many pertinent facts as can be obtained, in order that the best possible educational program for the money is developed. Presently most programs are based upon history and conjecture, not on future needs.

Specific objectives. The following specific objectives were believed necessary for the study:

1). To determine the qualifications needed by vocational and/or technical instructors in high schools and post-high schools in New Mexico by 1980.

2). To determine the number of vocational and/or technical instructors that will be needed in high schools and post-high schools in New Mexico by 1980.

Assumptions. The following assumptions were made in the study:

1). That Principals, Superintendents, Directors of Vocational Education and Vocational Schools will be the best authorities in predicting needs and/or qualifications.

2). That vocational educators and school administrators have some foresight about vocational education by 1980.

Limitations. This study was confined to high school principals, superintendents, directors of vocational schools, and directors of vocational education presently in existence in New Mexico.

Definitions of terms used.

Technical Education. A program designed to prepare youth and adults to enter recognized highly skilled technical occupations.[4]

Vocational Education. Vocational or technical training or retraining which is given in schools or classes under public supervision and control or under contract with a State board or local educational agency, and is conducted as part of a program designed to fit individuals for gainful employment as semiskilled or skilled workers or technicians in recognized occupations.[5]

Post-High School. Thirteenth and/or fourteenth year of education at any institution offering vocational and/or technical education which does not lead to a baccalureate degree.

## II. CONDUCT OF THE STUDY

The author's interest in improving vocational education came as a teacher of Vocational Agriculture in Georgia. As a graduate student at New Mexico State University, an opportunity to conduct a study in vocational education came as a result of the State Department of Education's interest in improving vocational education at the high school and post-high school levels.

The result of this study will be presented to the 1969 New Mexico State Legislature as part of a proposal for improving existing and formulating new teacher training programs for vocational instructors at the high school and post-high school levels.

As a first step the author reviewed several similar studies. A questionnaire was then developed through interviews with persons directly and indirectly involved with vocational education to secure specific information pertinent to the purposes of the study. Assistance in this area was provided by the Director of the Agricultural Institute, Head of the Agricultural and Extension Education Department and the Department of Research in the State Department of Education.

A rough draft of the questionnaire was developed and submitted to selected persons for corrections and suggested improvements. A list of suggested qualifications was developed in the questionnaire by the writer in three categories: educational, experience, and miscellaneous. Rectifications were made according to the pretestors and the final draft was completed.

Questionnaires were sent to high school principals, superintendents, directors of vocational schools and directors of vocational education programs within the state. They were to be completed and returned in fifteen (15) days of the date received. Whenever it was necessary to secure a response, second and third follow-up letters and questionnaires were sent to individuals not answering the first request seven days after the first mailing. In cases of failure to respond, the institution was left off the final list, except where the writer had evidence through other avenues that it was operating.

The questionnaires were summarized according to returned responses. The qualifications were ranked according to the largest number of respondents to individual qualifications in each category. To identify ranks and range of respondents in each category, six (6) to eight (8) qualifications were used in the educational category and five (5) in the experience and miscellaneous categories.

# CHAPTER II

# REVIEW OF LITERATURE

The literature was reviewed to investigate areas relevant to the purposes of the study: (1. the qualifications of vocational instructors projected in 1980 and (2. the demand of vocational instructors in 1980.

## I. QUALIFICATIONS OF VOCATIONAL INSTRUCTORS

In the review of literature no studies were found which had any relationship, directly or indirectly, with the projected qualifications of vocational instructors.

## II. THE DEMAND FOR VOCATIONAL INSTRUCTORS

In the review of literature two studies were found to be pertinent to the demand for vocational teachers in high schools and post-high schools. Educators are confronted by a number of vital questions: (1. What kinds of programs are needed for effective training to meet industry's changing needs? (2. What qualifications should we seek in vocational teachers? (3. How effective are the teaching aids we now employ? (4. How should we train for tomorrow's employment?

These challenges and questions should bring forth the best we have to offer in up-dating our vocational education system. Local

and state personnel will have to be more flexible and determined to take advantage of opportunities offered by Public Law 88-210.

A recent statewide occupational study indicated that there were more than 11,000 New Mexico firms and businesses, and also projected a need for vocational training for more than 68,000 persons to meet the employment needs of these businesses.[6] The results of this study presented a need for expansion of vocational programs in New Mexico. Such an expansion would entail the employment of additional instructional personnel. Additional vocational and/or technical teacher programs would be necessary to provide these persons. Such information on manpower needs and job availability is essential to planning for future development in any job or profession.[7]

A study conducted by Woodin with State Directors of Vocational and Technical Education reported 9,800 full-time teachers of vocational agriculture employed in forty-nine states during the 1965-66 school year. This study indicated forty-four states placed 905 beginning (new and replacement) full-time teachers were in teaching positions in 1965. This study also indicates a yearly turnover in personnel of about 9.6 per cent of the total employed in the field

---

[6]McComas, J. D., Occupational Need For Vocational and Technical Education, A Research Study. New Mexico State University. 1966, 3 p.

[7]Ibid.

of vocational agriculture.[8] These figures correspond with a similar study conducted by the Professional Recruitment Committee, Agriculture Section, American Vocational Association where a turnover of 9.5 per cent was reported.[9]

Woodin states that the quality of a vocational program is determined in large measures by the quality of instruction.[10] The development of new programs and the expansion of existing ones called for a supreme effort on the part of administrators to recruit qualified persons and offer them appropriate preservice and inservice training. Quantitative recruitment is not the only answer for persons drawn from business and industry who often do not have the teacher qualifications demanded in the classroom.[11]

In conclusion the literature reports a growing shortage of qualified instructors. State directors predict an increasing demand for instructors in all vocational areas in the future. Both high school and post-high school programs are being expanded in all areas and increasing numbers of teachers will be needed to fill the positions.

## CHAPTER III

## PRESENTATION OF DATA

### I. THE PROJECTED DEMANDS FOR VOCATIONAL INSTRUCTORS IN HIGH SCHOOL AND POST-HIGH SCHOOLS

Table I, Current Teacher Employment in 1967-68 and Projected Numbers needed in High Schools and Post-High Schools in 1980, summarizes the responses to the questionnaires as to the number of vocational instructors currently employed and needed. Of the 197 questionnaires sent 133 were returned, for a response rate of 68 per cent. In instances where the principals and superintendents in the same school system returned questionnaires, only one was used in the final count to eliminate duplication of needs.

TABLE I

CURRENT TEACHER EMPLOYMENT 1967-68 AND PROJECTED VOCATIONAL TEACHERS NEEDED IN HIGH SCHOOLS AND POST-HIGH SCHOOLS IN 1980

II. QUALIFICATIONS OF VOCATIONAL INSTRUCTORS AT HIGH SCHOOLS AND POST-HIGH SCHOOL LEVELS IN 1980

Tables IV through XVII summarize the responses related to the qualifications of vocational instructors. The projected

qualifications are listed according to preferences ranging from most important to the less important, determined by respondents marking their choices of suggested qualifications.

To determine the qualifications, the author developed a list of suggested ones. Projected qualifications were determined by the largest number of individuals responding to the suggested qualifications listed in Appendix D. Educational, experience and miscellaneous were listed as suggested categories. Ranks were determined by the largest amount of respondents to individual qualifications in each category. To show ranks and range of respondents in each category of qualifications, six (6) to eight (8) qualifications were used in the educational category and five (5) in experience and miscellaneous categories.

Current qualifications were listed to indicate the present qualifications used in employing vocational instructors in each vocational service. The current qualifications were taken from the Bulletin, the New Mexico State Plan for the Administration of Vocational Education under the Federal Vocational Education Act of 1963.

## Agriculture

Current qualifications for vocational agriculture teachers:[11]

---

[11]New Mexico State Board of Education. New Mexico State Plan for the Administration of Vocational Education under the Federal Vocational Education Act of 1963. Santa Fe. 1964, 10-11 p.

1. A bachelor's degree in agriculture
2. At least six weeks of practice teaching from a recognized college or university
3. Two years of farming or ranching experience after the age of fourteen (14) or two (2) years of agri-business experience
4. Hold or be eligible for a New Mexico Teacher's Certificate

# CHAPTER IV

## SUMMARY, CONCLUSIONS AND RECOMMENDATIONS

Chapter IV contains a summary of the study, the conclusions drawn based upon findings and recommendations made in view of the findings. Suggestions for additional research in projected qualifications and staff needs of vocational instructional at high school and post-high school levels in New Mexico are included.

### SUMMARY

The present study is concerned with determining the projected needs for vocational instructors in vocational and/or technical education at high school and post-high school levels and qualifications likely to be needed in 1980.

The findings of this study were based upon data secured by mailed questionnaires from high school principals, superintendents, directors of vocational programs, and directors of vocational-technical schools in New Mexico.

#### Agriculture

State administrators estimated that the number of high school teachers of agricultural education would expand from 60 in 1967-68 to 70½ in 1980, a percentage increase of 17.5 per cent. The number of post-high school teachers are expected to expand from 2 in 1967-68 to 14½ in 1980, an increase of 625 per cent.

## Business and Office Education

The number of high school teachers of vocational office education teachers were projected to expand from 104 in 1967-68 to 292 in 1980, an increase of 180 per cent. The number of post-high school teachers are expected to increase from 18 in 1967-68 to 47 in 1980, an increase of 161 per cent.

The greatest demand for vocational instructors in high school is in Business and Office Education.

## Distributive Education

State administrators projected the number of high school distributive education teachers would expand from 24 in 1967-68 to 71 in 1980, an increase of 195 per cent. The number of post-high school teachers is projected to increase from 1 in 1967-68 to 16 in 1980, an increase of 1500 per cent.

## Health Occupations

Teachers in health occupation are expected to expand from 15 in 1967-68 to 46 in 1980, an increase of 200 per cent. The number at the post-high school level is projected to increase from 9 in 1967-68 to 34 in 1980, an expectation of 277 per cent increase.

## Home Economics

State administrators projected that the number of high school home economics teachers would expand from 98 in 1967-68 to 158 in 1980, an increase of 61.2 per cent. The number of post-high school teachers is expected to expand from 0 in 1967-68 to 20 in 1980, an

increase of 2000 per cent.

Home economics teachers, in Table I, were listed as vocational and non-vocational. Findings above are concerned with vocational home economics teachers.

### Technical Education

Projections indicate that the number of technical education teachers would expand from 15 in 1967-68 to 79½ in 1980, an increase of 430 per cent. The number of post-high school teachers would expand from 13 in 1967 to 60 in 1980, an increase of 361 per cent.

Data-processing was an additional area mentioned by administrators. This area is usually included in technical education.

### Trade and Industrial Education

State administrators projected the number of high school trade and industrial teachers would expand from 60 in 1967-68 to 165 in 1980, an increase of 191 per cent. The number of post-high school teachers is expected to expand from 17 in 1967-68 to 67 in 1980, an increase of 294 per cent.

The greatest demand for vocational instructors at the post-high school level is in trade and industrial education.

## CONCLUSIONS

Projected qualifications show an increase in the requirements and certification of instructors in 1980. Service areas with minimum requirements of a bachelor's degree increase to a master's degree

with strong demands of philosophy, history and methods in vocational education.

Areas with requirements less than a B.S. show a strong demand for occupational experience at high school and post-high school levels.

In reference to the findings, it appears that the reported qualifications and needs for vocational instructors are expected to be on the incline. Administrators predicted a need for more qualified instructors in all vocational-technical areas in 1980.

## RECOMMENDATIONS

The following recommendations are suggested for further research into the present study.

1. The qualifications of teacher trainers for vocational-technical education instructors at the high school and post-high school level.

2. The vocational service areas having the greatest demand for new instructors.

3. The demand for teachers in vocational service areas at the high school and post-high school levels by instructional areas.

## Public Law

Public Law No. 88-210, Eighty-eight Congress-H. R. 4955

# APPENDIX A

New Mexico State University
College of Agriculture and Home Economics
Department of Agricultural and Extension Education

Dear Sir:

You will soon be receiving a mailed questionnaire as part of a study being carried out cooperatively between the Department of Agricultural and Extension Education and the State Department of Education by our graduate assistant. This study is concerned with projecting qualifications and needs of vocational teachers in high school and/or post-high school programs in the state by 1980. The result will be presented to the 1969 New Mexico State Legislature as part of a proposal for improving existing and formulating new teacher training programs for high school and post-high school levels.

It is understood that you may not have all the vocational services represented in your school presently or that you will have much choice in increasing the number or qualifications of persons presently employed. However, we would like for you to give us your best estimate of what is likely to be needed for both high school and post-high school programs by 1980.

We are asking your cooperation with this study by completing the items in the questionnaire and returning it to us before April 10, 1968.

Sincerely,

Leon A. Wagley, Head
and Associate Professor

# APPENDIX B

New Mexico State University
College of Agriculture and Home Economics
Department of Agricultural and Extension Education

Dear Sir:

The attached questionnaire concerning vocational teachers is part of a state-wide study being carried on cooperatively with the State Department of Education. This study is concerned with the projected qualifications and needs of vocational teachers at the high school and post high school levels by 1980. The results will be presented to the 1969 New Mexico State Legislature as part of a state proposal for improving existing and formulating new teacher training program for the high school and post high school levels.

Your responses are particularly desired because of your experience as an administrator. Furthermore, we feel you are the best authority in predicting future needs and qualifications. The enclosed questionnaire has been tested with a group of your fellow school administrators. Their suggestions have been incorporated in it in order to make it possible for us to obtain all necessary data while requiring a minimum of your time.

It will be appreciated if you will complete the questionnaire prior to April 10, 1968 and return it in the enclosed stamped envelope. Your comments concerning any aspects of the needs and qualifications will be welcomed.

Thanking you in advance for your cooperation.

Sincerely,

David J. Houston
Graduate Assistant

APPENDIX C

NUMBER OF VOCATIONAL TEACHERS NEEDED BY 1980

(Please check the number of teachers presently in your high school or post high school and the number you estimate will be needed by 1980)
